## SEVENTH SERIES

### THE FORESTER'S GIRL.

By Mrs W. F. IRVINE BELL, Author of *John Pardon's Choice*, *Ole Cam'ron*, &c.

#### CHAPTER I.

HUGE clouds of dust—red, as of pulverised copper—surged forward into the level gold shafts of a low-hanging sun, while, like fresh battalions eager for an equal share of glory, rolled other dense masses in the wake of Charlie's 'outfit.' From the lantern, filthily streaked and oily, that rocked at the tail of the swaying wagon with its spidery frame and light canvas top, to the tawny backs of the mule wheelers and the ears of the ill-matched leaders, every square inch, crack, and cranny was dredged with an all-pervading smother kicked up by eight pairs of struggling hoofs and the heavy boots of the man plodding beside his sweltering team. In his right hand, loosely held, was a double set of long lines begrimed with mingled dust and sweat; while with the other he constantly laid hold of a trace, or gave a short, stiff shove to a wheel as it slowly revolved, shedding from tire and spokes a small Niagara of the same terribly clinging powder. Dust—dust—everywhere dust, from the crown of the man's broad felt hat and the square shoulders of his thick-set figure, clad in jacket and overalls of blue holland, to the toes of the great leather boots into which his nether garments were firmly tucked. Dust, too, in his dark curly beard, in the wrinkles around the kindly blue eyes; dust even on the curved wooden stem of a china pipe which dangled between tightly clenched teeth, emitting an odour with which not the combined essences of all the pines and balsams on Tunnel Hill could compete. Yet from the grimy face of the smoker neither dust nor sweat could obliterate a dominant cheerfulness, nor weary miles travelled, and still to travel, check the flow of his talk, as in English, fluent, but strongly punctuated with foreign accent, and constantly interrupted by expostulations and exhortations to his team, he gossiped with the two or three dust-covered passengers in his wagon.

'Oh yah!' he said, addressing two young men who, enveloped in dust-coats, were seated among an amazing collection of boxes, bags, sacks, guns, fishing-rods, water-melons, peaches, and onions stowed away in the body of the vehicle—'oh yah, dere plenty big fish in de lake; six—eight pound.—Ged ap, dere, "Baby"!—Mister Conner,

he got near forty pound in one afternoon. Came back de-lighted.—"Billy," you good-for-nuthin' mule, I'll tak' de whip to you if you don't do your share of de pullin'!—An' de creek is full of splendid trout, too—de best I've seen in several yeahs. Where is de creek? Why, just close to de station. You can jump out of your bett, t'row your line into de water, and catch fresh fish for breakfast,' he concluded, laughing heartily at his own wit.

'That sounds all right,' remarked one of the young men, turning to the other; then went on: 'But, see here, is there much more of this hill? For if so, Kenneth, we had better get out and stretch our legs; no use these poor beasts dragging *us* up! Good Lord! did you ever see such dust?'

So saying, he stood up, the accumulated dust falling like the aftermath of an avalanche from his coat, of which divesting himself, he appeared in the well-cut, well-fitting clothes that at once bespoke him not a native of the great forest-land through which he was travelling.

His companion, a tall, slightly built man with pale, intellectual face and short-sighted glasses, followed his example, and the two prepared to leap from the wagon, as Charlie, shoving a stone under a back-wheel, called to his panting team to 'whoa!'

'Awful dusty,' he exclaimed cheerfully, slapping his breeches and making futile efforts to brush his jacket. 'But when de rains begin de mud is worse. Last winter I got late comin' out of de woods, an' de mud was up to de axles of de wheels. "Buck"—dat's de off-mule—he got sick, an' lay down in de road; an' "Baby"—dat's de white mare—she was so tired, she couldn't pull no more; an' I t'ought we'd have to spend all night on de road! Awful, it was. But we came t'ru. You can trust "Baby" to get you home *some* hour of de night. Never saw such a horse!' and he ploughed forward a few paces to pat the sides of an old mare, whose own dam could not have recognised in the brown-stained, raw-boned beast the milk-white foal which long years before had galloped beside her in the succulent meadows of Onion Valley. 'But come, come!' he exclaimed; 'we must git

along, else we won't make de station before dark—an' it gits dark *awful* quick in de woods. If you gen'lemens like to start ahead a leetle way, you can tak' a short cut t'ru de bush to de left, an' not git so much of dis blame dust.—P'raps de young lady'd like to walk too? Shall I help you out, Mees Lalonne?

The two men, who had already started forward, hesitated for an instant, as though uncertain what might be expected of them; but as the girl, swathed in a dust-sheet that Charlie had put around her shoulders, and squeezed on the driver's seat between a bulky mail-bag and a roll of blankets, made no reply, they moved on, first, however, whistling to a red-brown setter, who, reluctantly uncurling himself from a heap of sacks at the girl's feet, jumped out and followed them.

'Fraid you're awful tired, Mees Lalonne,' said Charlie kindly; 'but dis is de worst of de road—dis hill an' de desert. Den we git into de big timber, an' it's awful nice. You can smell de balsam *dere*, right enough. Want to git down?'

'No, I guess not, thank you,' replied the girl in a crude but pleasantly modulated voice, glancing down at her shoes, of diminutive size, patent-leather, and high-heeled.

Charlie's blue eyes followed the direction of hers, and as he gathered up the lines for a fresh start and kicked away the stone from the wheel, his genial laugh broke out as he said, 'You want to keep dem fine shoes clean till you see your young man, eh? He's a nice young feller, Mees Lalonne. Everybody likes Dave—ain't a better boy in de National Reserve dan Dave Hardy. Goin' to git married soon?' he questioned.

The girl reddened beneath the shade of a hat, dainty and becoming, but too smart for such a journey as the one on which she was embarked.

'I guess so,' she replied. 'Dave says he don't want to wait any longer, but I'd just as soon teach school another year. There ain't any hurry—and I don't think I shall like living in these dark woods. Must be dreadfully lonesome,' she added, glancing, with a little shiver, at the thick-standing trees enclosing them on every side. 'Still,' she went on, as Charlie, sucking hard at his pipe, looked thoughtful, 'of course it's lonesome for David *too*, living 'way off there. You ever seen where he lives, Mr Axel?'

'Yah, yah—lots of times. 'Tain't more than twenty—twenty-five miles beyond de station. Awful pretty up *dere*—*awful* pretty. De country is more open—not so much big timber, tho' *dere* lots of trees; an' de lakes—Goose Lake an' Laughin' Lake, an' de rest—are just bootiful. Oh, you'll soon git to like it, Mees Lalonne, w'en you're Misses Hardy, eh?' he rallied her with easy but unoffensive badinage.

The girl, however, not answering, Charlie

addressed himself to his team, urging this one with word and whip, encouraging another with kindly praise, until, after a final scramble, the wheels bumping violently over severed roots and obtruding stones, the animals gained the crest of the long, wooded hill, and came to a halt.

'Now where are dose young gen'lemens?' queried Charlie, looking about and uttering a far-carrying 'Coo-ee!'

Came an answering call, and then, preceded by the red-brown dog, the young men appeared, one of them carrying a branch of dogwood, its snowy cross of petals still touched with the faint green of their birth.

'Oh, ain't those lovely?' exclaimed the girl, her large dark eyes dwelling delightedly on the flowers. 'My! don't they make you feel *dirty*?' she went on, addressing the men with easy freedom. 'Shall I hold them till you get in? They haven't any smell? No; but they feel cool and nice,' she continued, laying the white flowers caressingly against the clear olive of her own cheek, a gesture and a contrast that did not escape the eyes of the young man, who, resuming his dust-coat and adjusting his long legs again among the various traps, announced he was ready.

'Where's that dog of mine? Oh, *there* you are, you lazy rascal!' he exclaimed, as his eyes fell upon the dog's curly hide, already re-established at the girl's feet. 'Isn't he in your way?' he asked civilly, adding, as she held out to him the bough of dogwood, 'Oh, keep the flowers if you care for them,' and at once began further questioning of their communicative host as to the prospects of sport.

For a while Anita Lalonne listened to their conversation, striving to piece together any fragments that might throw light upon the new, strange life, nearer to which every revolution of the dusty wheels was bringing her, until at length her thoughts outran the slow-dragging vehicle and busied themselves with the longed-for end of the wearisome journey. Would David be there to meet her? Would he look much altered? He had written her that he was as brown as an Indian, and that she must not be frightened if his head resembled that of a buffalo, as he had had no chance to get his hair cut. *That* would not matter, she thought; she rather liked his curls, although David himself despised them.

Would he find *her* changed—prettier, perhaps, with her hair done in the latest fashion? Then presently she caught sight of her shoes, and she reflected that Charlie Axel had regarded them with a rather disapproving air. However, high heels could not matter, because David had said there would be no need for her to walk much, as he had a second horse, and would teach her to ride. Twenty-five miles to where he lived! It seemed a terribly long distance in

this sort of country—nearly as far again as they had already come with this dreadful wagon, in which she had been sitting for hours and hours. Her back was beginning to ache. If only the tall, pale man sitting behind her had been David! She straightened herself with a jerk, fearful of dropping to sleep and falling against the stranger. Him she could not see; but his friend (evidently the owner of the nice dog), seated immediately behind the driver, she could readily observe without appearing to do so. Presently she fell to studying his face—profile, three-quarters, occasionally full, as the wagon jolted, shifting all their relative positions. English, of course; and, to judge from his clothing and luggage, probably rich, and travelling for pleasure. Travelling! The word caught at some particle of gray matter restlessly stirring in her brain. That was it! She had seen this man's face before, just as it looked this moment—the fine profile, with the beautifully straight nose, short upper lip, and round chin; not the square-moulded chin so typical of her own countrymen. His eyes too, when she chanced to see them full—great, grave, gray eyes; not American eyes, like David's—brown, quick, and sparkling. Yes, of course she had seen him before; but where—where? The insistent question hammering in her brain, together with the regular creak and laboured straining of the wagon, gradually overcame her efforts to keep awake, and she dozed uncomfortably; while Charlie's hard-wrought team, having done their last bit of collar-work, broke into an irregular, lolloping gallop, their raw-boned, ill-assorted carcasses heaving up and down, odds and ends of old harness flapping, streams of mud-coloured sweat pouring down their panting sides, and weary hoofs forging—click-click, click-click—as the poor creatures, encouraged by at last striking the level stretch of so-called 'desert,' pressed eagerly forward to their Eden of stable and straw, of crushed barley, and sweet, cold water from the fathoms-deep well at the Grizzly Station; for, though he drove hard and accomplished more miles in his three-day round, in and out of the mountains, than my lady's pair would have covered in a month, Charlie was nevertheless a kind master, and ingenuously proud of his 'four-in-hand,' albeit to the *unprejudiced* eye a veritable rag-market of old hides.

With their owner as with his team, the prospect of the journey's end, even though another five miles of strain and dirt lay before them, acted like a stimulant. He talked and joked incessantly, cracked his long whip, alternately praised and chided his animals, the while pointing out and explaining the strange piece of country through which they were passing, known as the 'desert.' This, however, is not the desert of alkali and sage-brush familiar to travellers across the mid-American continent, but a flat, dust-laden tableland, curiously suggestive of the

tropics in the denseness of its natural growth—manzanita, buck-brush, grease-wood, wild plum, with here and there a stunted pine or a live-oak; while the 'inverted bowl' of unfathomable blue so merges in the ragged horizon as to foster an illusion that here indeed one has reached the 'rim of the world.' Yet even here, on this raw edge, beset with thorny and unlovely things, Nature has prepared one of her choice surprises for the wanderer in her waste places, for, lifting on tall slender stems blossom after blossom of exquisite fairness and fragility, a species of beautiful lily, with silver sceptre, queens it right royally over the heads of a coarse proletariat of plant life.

'Makes one feel like moralising,' half-seriously remarked the young man whom his friend addressed as Kenneth, and whom Charlie spoke of as 'the doctor,' pointing to a sheet of lilies shining through the veil of drifting dust.

His companion merely nodded; but presently, as the team slowed down before rushing the sudden rise where the desert breaks on the limits of the big timber, he sprang lightly over the wagon-wheels, shortly returned with a great bunch of lilies, and laid them beside the girl now sleeping soundly, her head resting uncomfortably against the canvas-top upright, and one hand grasping the bough of languishing dog-wood.

Gavin Barrie—such was his name—whose grave gray eyes missed nothing, took note of the girl's hand, white and absurdly small, but the fingers too short and the nails over-manicured; in some indefinable way they prepared him for the high-heeled, patent-leather shoes gleaming among the ruddy waves of his dog's coat. A moment later he resumed his seat, quietly, so as not to disturb the weary sleeper.

But Charlie, too well used to the slumbrous effects on his passengers of the long, hot journey to hesitate at rousing them, shoved the flowers towards her, exclaiming in his loud, cheery voice, and causing her to waken with a little cry of alarm, 'See, Mees Lalonne! Some one has been pickin' you a bootiful weddin' bookay while you've bin sleepin'. Ain't them lilies awful nice? Just de t'ing for a *bride*!' he continued, laughing and winking broadly at his male passengers. 'Mees Lalonne won't tell me when de *day* is to be,' he went on, 'but I say her young man had best look sharp wid dese two nice young gen'lemens about—eh, Mister Barrie?' Then, adding abruptly, 'Guess she's awful tired,' he took out his long whip, and snapping it loudly over his team, said to the girl, with kindly encouragement, 'Only another half-mile to de station, an' den likely you'll see Dave.'

At this the colour flew to the girl's pale cheeks, and she sat up, patting her hair, dexterously squeezing the flimsy hat into shape, and striving to shake the dust from her skirt. In another

few moments, with a rush and a rattle, a sharp cracking of the whip, and echoing click-click of iron-shod hoofs, Charlie's outfit swept down a steeply graded bit of road thickly carpeted with pine-needles, and, 'mid a wild barking of dogs and neighing of horses tethered to tree and feeding-trough, pulled up before a low log house on the edge of a small clearing.

Darkness with swift, slippered feet had already invaded the forest, and was wrapping in folds of velvet blackness every bole and building, man and beast, save where, in a receding aisle of giant pines, the canvas of several tents took on ghostly forms of dusky gray. At the sound, however, of the approaching wagon, yellow fingers of light from hurriedly kindled lamps shot suddenly through the small-paned windows of the cabin; while instantly at the door appeared a blonde-haired Swede, sleeves rolled to the elbow, an apron tied over the inevitable overalls, his face wet and shining from the heat of a wood fire, over which, to judge from the aroma that clung to his person, he had been engaged in frying ham. Close behind him toddled a stout little woman, with smoothly parted gray hair, a crochet-hook and reel of cotton in her hands. These two, speaking with the same strong accent that marked Charlie Axel's speech, and without preliminary greeting of any sort, proceeded to bombard the poor man's ears with questions in short, anxious staccato.

'Did you remember de bakin'-powder, Charlie?'

'Dere isn't a speck o' lard in de house, Charlie. I hope you don't forget *dot*.'

'Where is de golden syrup? Charlie, did you forget de golden syrup? Dere ain't a drop for de hot cakes.'

'Yah—yah!' shouted Charlie in tones reassuring and wholly untinged by the irritation which ordinary mortals must have displayed. 'I t'ink I got eberyt'ing. You just wait a minute. I got sweet-potatoes and green corn and peaches—*awful* nice peaches— But here's a young leddy, momma,' he broke off, addressing the woman still busily crocheting—'Mees Lalonne—Dave Hardy's young leddy;' and, with smiles illuminating his dust-begrimed countenance, he held up his hands to the girl, who, standing up in the wagon and clutching her sheaf of lilies, strove with great, anxious eyes to pierce the gloom where a group of men, lanterns in hand, were distributing hay to a row of tethered animals.

'Dave! Where's Dave?' she asked with quivering lips, and making no motion to descend from the wagon.

'Oh, he ain't come yet, likely,' answered Charlie in his cheeriest tones. 'But here's momma waitin' to show you your room after you git some supper. So come along. *Dot's* de way!' he ejaculated heartily, and in his strong arms lifted the timid girl clear over the high wheels. 'Now you go 'long with momma. I

must see to all dis stuff an' help wid de horses.— You got eberyt'ing of yours an' de doctor's, Mister Barrie?' he asked, as the young men, hands loaded with their various belongings, walked about, shaking the dust from their clothes and stretching their stiff legs.

'You pleece come right in to supper, Mees Lalonne,' said the old woman, starting for the door, and apparently not hearing Anita's plaintive exclamation.

'But I'm so dirty. Can't I wash first?'

A sense of great dreariness swept over her, and half-unconsciously her eyes turned to seek her fellow-passenger—the man with the grave gray eyes who had gathered flowers for her. But he was at some distance, already extricating his red-brown dog from a first passage of arms with a hybrid platoon of belligerent canines; so the girl, from sheer terror of the strange surroundings and the blackness of the forest, hurriedly found her way through the door, which opened into a long, brightly lighted room, where a table was set with rows of cups and plates, piles of bread, hot biscuits, butter, and fruit. These were quickly reinforced by steaming coffee and huge dishes of ham and eggs; but to the old woman's exhortation that she should sit down and take her supper, 'wid-out waitin' for de menfolks,' Miss Lalonne only shook her head.

'I don't want anything to eat, thank you; I'm too tired. May I go to my room, please—that is, if you don't think there's any chance of David Hardy getting here to-night?' and she turned a pair of pleading dark eyes upon the old woman standing before her with a large cup of coffee.

'To-night—in *dis* blackness!' she retorted half-impatiently. 'You want him to fall into de cañon!' Then, seeing how white and weary the girl looked, she said more kindly, 'Dere now; he'll come to-morrow if he knows you're on de road. Better drink dis cup o' coffee, an' den I'll get some water an' take you to your bett. Guess you'd rather be in one of de huts dan in a tent, wouldn't you?'

'Oh yes, please,' cried Anita, endeavouring to swallow the coffee. 'I'd be frightened to death to sleep in a tent; it seems so dreadfully lonesome here.'

'Dere ain't nuthin' to be 'fraid of,' replied her hostess. 'De bears don't come very close no more. Too many folks trappin' 'em. Dere was a mountain-lion in de corral de udder night, but dey only follow de goats; dey don't come round de houses.' So saying, with candle streaming in the night air, she led the girl a short distance from the main cabin to a small frame-house, perched upon short posts, and divided into several rooms, each one with its own door and flight of steps.

'Here's your room,' said her hostess. 'I sleep in de hut opposite, an' de menfolks are in de

tents close by; so you needn't be scared of nuthin'. Gute-night;' and she toddled away, the retreating candle seeming to leave an inky blackness in its wake.

Trembling and miserable, the girl, with feverish haste, closed and locked the door, and dragged a chair against it; then, drawing across the windows the flimsy bits of pink cambric which answered for curtains, and lighting a candle, flung herself on the lumpy-looking bed and burst into a passion of tears. What a dreadful place! Why had not David met her? How—ah! *how*—could she marry him and live—actually *live*—in these fearful forests, with nothing but rough-looking men and—and mountain-lions? At the thought of them, and fancied sounds among the trees, she sat up, her hands clenched in terror, and her eyes fell upon the bunch of lilies lying in a disordered heap, where some one had carelessly thrown them down upon the dusty pieces of luggage.

'Oh, you poor, lovely things!' cried the girl, instantly forgetting herself and her woes. 'Not a drop of water, and you're all drooping!' and with a gesture of contrition she laid them against her breast and lips; then, nothing else being available, stuck the long stems into the coarse water-jug. The light from her candle turned the blossoms into silver, caught the pink of the curtains, and struck into bright colour-notes a crude patchwork quilt crumpled on the bed. Anita Lalonne's eyes, huge and dark in her white face, feasted on the varied touches of colour; her tears dried, and presently catching a glimpse of her own face in a diminutive mirror hung against the white cheese-cloth-covered walls, she broke into a little laugh, mingled with disapproval.

'My lands, Anita Lalonne,' she said, addressing her own reflection, 'what a fright you do look! Guess maybe it's just as well Dave Hardy *didn't* come to meet you!' and hastily filling a basin with the water, now lukewarm, that the old woman had left, she bathed her tear-stained face.

Then, searching among her things for brush and comb, she pulled the pins from her black hair, which, thus released from the hideous torture of snail-like rosettes into which it had been twisted above her ears, flowed in soft, lustrous waves about her shoulders. Catching a few of the strands in her fingers, she wove them to and fro, after the manner of all young women trying different styles of hair-dressing, saying aloud, 'I wonder whether Dave'd like my hair done like *this*'—and she paused, turning her small head this way and that before the glass—'or the way I wore it to-day; it don't look so thick in those rosettes, but it's fashionable. My goodness, what a dirty "waist"!' she went on, critically inspecting her dainty but creased white blouse. 'Guess I sha'n't wear

white clothes much longer,' and she wrinkled her nose pettishly; 'but, anyway, I'll look decent while I *can*. I'll put on the flowered-muslin waist to-morrow, and wear one of those lilies. Yes, they're picking up all right,' she added, darting across to the jug of flowers.

Presently, with a muffled cry of alarm and a smothered laugh, she huddled down in a corner, exclaiming below her breath, 'Heavens! I wonder if those men can see in!' Then, peeping cautiously through the curtain, 'It's the two Englishmen and Mr Axel. I guess they're going to one of the tents. Yes, this next one! And there's the dog! Well, I'm kind of glad they'll be so near; 'tain't half so lonesome.'

Still apprehensive of being seen, she puffed out the candle, pulled off her clothes, and was soon settling herself in the strange, bulky bed. A curious feeling of comfort and security stole over the weary girl when she saw that the light from the neighbouring tent shone through her small window, making white patches on the wall-covering and waking the lilies into a sort of ghost-life.

The men had not yet dispersed; she could hear the soft, dry rustle of pine-needles beneath their feet as they moved about in front of the tent, lanterns in hand, which, when shifted, threw sudden, distorted shadows on the wall of her room—now the thick-set figure of Charlie Axel, whose loud, cheery voice was readily distinguishable, still fluent and enthusiastic over the topics of fishing, hunting, and the like; now the tall, slight forms of the younger men, curiously elongated and misshapen, like comic silhouettes. At length there was an interchange of 'Good-nights;' she heard the Englishmen speaking in low tones as they parted for their respective tents, while a muffled thud-dud-dud on the flooring of the one next her room announced to the girl's quick intuition that 'Bob,' the red-brown setter, with untroubled conscience as to venison out of season, was punishing his booty in the shape of a huge bone.

Presently there mingled with the pine-scented breeze that stirred her curtains a whiff of tobacco, nutty and sweet, and as it reached the girl's nostrils the effect was strange indeed. Red rushed the colour to her cheeks, and the dark eyes grew brilliant with excitement, as she exclaimed in a forced whisper, 'Now I know! That is who he is. How could I have forgotten?'

Wide awake, she stared at the white-patched walls and the ghostly lilies, a flood of memories racing through her brain. Then suddenly the tent light was extinguished—darkness—sough-sough of swaying pines—thud-dud-dud of a dog and his bone—Anita Lalonne slept.

## CURTAINS.

By MARIAN BROOMFIELD.

I SUPPOSE that even in these days of qualified statements it would be safe to assert that there is no one—literally no one—so superior to his fellows as to possess no weaknesses, no conceits of any kind. And I think it would be almost equally safe to say that most people have one conceit in common—a conviction that they are good character-readers. No doubt it is a delusion and a snare, but we cherish the belief no less. We go even further, and have our own particular way, or method, of character-reading. I know, for example, a gentleman who judges every one by his boots. Introduce a new acquaintance to him, and his eyes will travel downwards to his boots immediately. If they are neat, well laced up—aristocrats in the world of boots, so to speak—well and good; but let them be down-at-heel, with shabby laces or having the tabs hanging out, and the wearer is doomed by my friend to be cast into the outer darkness. For myself, I place no reliance in boots; my own special character test is curtains. They seem to me to reveal much. Walk through the suburbs of any town; here is a row of villas alike in every detail excepting for the curtains. And of these no two pairs are the same. Here are a pair of bright yellow lace, frankly ugly, yet not repellent. I imagine the owner to be large and plain, with what we are wont to call 'a good heart.' Next to them, perhaps, will be a flimsy, gaudy pair, obviously destined not to outlive the first wash. They were chosen and put up, I feel sure, by a woman to whom the same remark might apply—a woman somewhat shallow, if perhaps fair of face. Then in a long row of ordinary houses with windows discreetly veiled by nondescript curtains—with like owners—one may sometimes see a pair no less ordinary, perhaps, but distinguishable, by their dainty spotlessness and by the precise folds in which they hang behind the window, as belonging to some home-lover who, bestowing much affection on those around her, yet has some to lavish on the inanimate household objects which have a place in the heart of every woman who cherishes her home, who is a lover of places.

Then there are the curtains of the artist, of the lover of the beautiful, of the miser, of the cheerful, colour-loving people; the curtains that hang crookedly, the curtains that are set straight. We might enumerate them indefinitely; they are all suggestive; they all tell a story for those whose interest gives them eyes.

And, indeed, I sometimes wonder if curtains do not do more than merely indicate the characters of the owners; I wonder if the curtains we hang in our houses do not bear a marked

resemblance to those we hang before our minds our inner personalities, our souls, if you will. All the curtains of the world, from the gorgeous Eastern tapestries to the tent-flap of the Red Indian, do not show a greater range or more variety than these mind-curtains which every human being hangs before a certain chamber door. They are of every texture and of every conceivable colouring. There is the curtain of flippancy, flimsy-looking enough, in all truth; and yet its gauzy folds and soft meshes prove a more effective barrier than many an iron gate. Then there is another brightly coloured curtain that we see in many of the houses of our friends, to which we give the name of wit, repartee, mental brilliance, which in some intangible way makes people unapproachable, and which, like a bright yet invisible sword, wards people off—and rightly so, since this is its owner's protection against curious eyes. The pity is, however, that we should sometimes close and lock the windows too, and so keep out God's fresh air and sunshine. Then, also, we have all seen and remarked the heavy brocade curtain of dignity and reserve; a useful curtain this, and one which differs from most of its kind in that, instead of wearing out with the passing years, it becomes thicker and more effective. Again, one might enumerate indefinitely, as one may study endlessly, these curtains in the lives of those around us. Study them? Yes. But lift them! Ah, almost never! The 'never' is qualified, I think, because for every one there is or has been some one who has the right and the power to enter his inner chamber. Some of the more fortunate have friends, dear friends, who may lift the corner of the curtain and look in upon them from between its folds; but even for these there is but one who may lift it, and, entering, see and understand the hopes, the aspirations, the ambitions, the ideals that lie hidden there. It is fitting that it should be so. And yet sometimes I wonder if we do not neglect a duty, or, to put it on a higher plane, miss a joy, in not trying to understand each other a little better. We might escape the crime of self-absorption more often, perhaps, if we cared just a little more. Sympathy and charity can see through the smallest rent in the curtain, a rent which indifference or dislike would never even know to be there. It is the old fable of the sun and the wind; sunshine will unfasten the cloak which the utmost fury of the wind only causes the traveller to wrap more closely around him. We may not enter in, but we might raise the corner of the curtain more often than we do. And, indeed, there are a few people who, by virtue of a commanding love for humanity,

a greater sympathy with it, a brighter spark of the divine fire, have the right of way to every heart. It is my very great privilege to know one such—one who is the recipient of the troubles of every one, who shares in their highest thoughts and deepest woes.

For the rest, our inner chamber is sacred to ourselves. We may let the dust gather

there, we may harbour noisome things and evil, we may store in it things of unfading beauty, and no man's hand shall stay us. It is ours, and ours alone, until that great time when the curtains, our cherished curtains, shall be flung wide, and all we have and all we are shall stand revealed in the light of the eternal day.

## THE 'MARINER'S' RETURN.

By 'TAFFRAIL,' Author of *Pincher Martin*, *O.D.*; *Carry On!* *Stand By!* &c.

### CHAPTER I.

FOR the past four-and-twenty hours the air had been full of garbled rumours of a great naval battle in the North Sea. They had started, like most other rumours, in London, but had gradually filtered through the country in some mysterious manner until their veracity or otherwise was discussed even in the peaceful village of Caxton, nestling in the midst of its woods, its meadows, and its ripening corn-fields in the heart of rural England.

The little place lay two miles from the nearest railway station, and the news of the battle, if it were really news, had emanated in the first instance from Mrs Ruff, the talkative wife of the stationmaster. She had come in to do her shopping during the afternoon, and, having heard the story from her husband, who had been told it by the guard of the train passing through from London at 11.47, imparted it in turn to the vicar; to Mr Bent, the schoolmaster and organist; to Mr Fairchild, the grocer; not to mention all her lady friends and acquaintances. The story lost nothing in its narration, and by the end of the afternoon the habitués of the 'Flying Swan,' were telling each other that Mrs Ruff had said that one or other of the opposing fleets had been utterly demolished, though she was not quite certain which.

But the good people of Caxton were not disturbed in their minds. They had heard so many other rumours of battles at sea, of hordes of Russians passing through England on their way to the Western front, and of successive captures of Paris by the Germans, all of which had subsequently proved to be untrue, that they were frankly sceptical. The old vicar, indeed, who had known Emily Ruff since childhood, even went so far as to chide her in a friendly way for an idle, loose-tongued gossip.

Caxton was by no means unpatriotic. On the contrary, it took a great interest in the war, and practically all the younger men had hastened to join the army when the call went forth for volunteers. Those who did not hasten of their own accord, moreover, those young fellows who were looked upon as shirkers, had their lives made a misery and a burden by the efforts of

an organised gang of maidens, who whiled away the monotony of the evenings by singing outside their cottages a song containing the praiseworthy remark, 'We don't want to lose you; but we think you ought to go.'

Caxton also had its own force of eight special constables, who patrolled the neighbourhood when Zeppelins were in the vicinity, and afforded some amusement to the juvenile population when they occasionally marched to church on Sundays with their batons and armlets. The juvenile population—and small blame to them—were very anxious to know if the specials were really proper policemen; and it was only when young Tommy Tucker was apprehended by one of them for lighting a bonfire in his father's garden after dark, was haled before the magistrates, and, though threatened with the violent application of a birch rod to the seat of his trousers, was tearfully released with a caution, that they were really convinced.

Nailed up inside the porch of the church, too, was a 'Roll of Honour' of those men belonging to the village who were serving their country; while another sheet of black-edged foolscap, headed, '*Dulce et decorum est pro patria mori*,' contained the names of nine who would never return.

But the people of Caxton, living so far inland, knew little of the navy, and less of what it did. Few of them had even seen the sea, and so far as they were concerned the war was primarily a khaki war, for they saw their fair share of the prevailing colour when its wearers came home on short leave from the front or from the training-camps. Then it was that they heard, with a wealth of lurid detail, what the army thought of the Hun and all his works.

The blue uniform of a sailor, however, was a rarity. In fact, the only naval man in the village was William, the eldest son of Reuben Martin and Mary, his wife. Mr Martin was Farmer Standing's right-hand man; but his son, for some reason best known to himself, had elected to join the Royal Navy, and was now serving as an ordinary seaman on board the

*Mariner*, which vessel, as his mother proudly said, was 'one of them there torpeder-deestroyers.'

Even Reuben Martin was rather hazy as to what a 'torpeder-deestroyer' really was, and sometimes, after looking at the illustrated papers in the Working Men's Club, pictured his son and heir sitting inside a small, steel, cigar-shaped object which dashed through the waves at an incredible speed, and was the terror of all the Huns afloat. But, of course, Mr Martin was not a naval expert. He had only been to the seaside twice, and on one never-to-be-forgotten occasion had been on board Lord Nelson's *Victory* in Portsmouth Harbour. In consequence he rather imagined that all modern battleships were like the old three-decker, though he was aware that they were driven by engines and boilers instead of by sails.

So the Martin *ménage* was the only one in the village which thought twice about the rumours of an action at sea, and Mrs Martin herself was rather anxious.

'Reuben,' she said to her husband at supper that evening, 'have you heard what Emily Ruff's bin sayin' about a battle?'

'Ay, mother,' nodded the man, munching stolidly at his bread and cheese. 'There's bin a deal o' talk flyin' round, but it's nothin' to go gettin' worrit about.' As a matter of fact, he was feeling vaguely anxious himself, but it would never do to show it to his wife.

Mrs Martin gazed fondly at the photograph of her son in his bluejacket's uniform propped up in its place of honour on the mantelpiece.

'So you think there's no truth in what they say?' she persisted.

The man wiped his lips before replying. 'I dunno, mother,' he said slowly, averting his eyes. 'Maybe there's bin a bit of a flare up.'

'But our Bill,' she returned with misty eyes and trouble in her heart. 'Suppose he's'—

'Cheer up, lass,' he answered, leaving his chair and going across to pat her affectionately on the shoulder. 'There's no call to get worrit, I tells you.'

'But I never wanted him to go to sea, Reuben!'

'He'd 'a' bin in the trenches by now if he hadn't, my gal,' the husband replied, filling his pipe. 'I wouldn't 'a' kept him back.'

'No more would I, Reuben! No more would Bill himself; he's that proud, bless his heart! Don't you reckoner what he says to you when we was talkin' o' makin' him a farmer along o' you? Don't you remember how he says he must see the world? It was them adventure books he'd been readin' what did it,' she added with a sigh.

'Ay,' her husband nodded, 'I remembers; an' I reckons he did the right thing, too, lookin' at it all ways. I likes a lad who knows his own mind an' wants to do things, 'stead o' bein' stuck in a li'l place like this all his life.'

Mrs Martin looked up quickly. 'What's the matter now, Reuben?' she inquired. 'I thought you was satisfied?'

'So I am, lass,' he grunted. 'But I'm gettin' old. I've turned fifty, an' when I was Bill's age things wasn't what they is now. If I was a lad agen I'd do like Bill did. I'd'—— He hesitated.

'You'd do what?'

'I'd go out an' do things, 'stead o' stickin' at home here like a turnip,' he went on heatedly. 'This life's all right so far as it goes, but if I was young agen I'd go an' help smash this Kayser feller they all talks about. If it comes to that, I believes I'd go an' do it now if they'd let me.'

'But they won't, Reuben, will they?' she asked anxiously. 'What'd I do wi' both o' you to the war?'

'You'd do what other men's gals is doin',' Martin said proudly, drawing himself up and expanding his deep chest. 'You'd be proud o' thinkin' I'd gone.'

'Y-yes, I'd surely be that,' she admitted. 'But there's no chance o' their takin' you, Reuben, is there?' She looked at him with troubled eyes.

'No, wuss luck!' he growled, shaking his gray head. 'Even if I said I wus twenty year younger, they'd not take me to the army. 'Sides, there's my rheumatiz an' they varyose veins in me legs.'

'Thank God for them, Reuben!' said his wife huskily, making an unnecessary clatter with the plates as she cleared away the supper.

Martin grunted and lit his pipe. To tell the truth, he was jealous of his son. And not only that. In common with a number of the older men, he was envious of all the young fellows who came swaggering about the village in their khaki, and told their true but quite incredible tales of what they had seen and what they had done. They were doing their country's work, while he—well, he was merely a stay-at-home, a village turnip.

But the rumours were only too true, for next morning the papers came out in glaring head-lines. 'GREAT NAVAL BATTLE IN THE NORTH SEA,' 'HEAVY BRITISH LOSSES,' 'GERMAN FLEET DRIVEN BACK,' they said.

Her husband was away at his work when the news came, but Mrs Martin bowed her face on the table and wept.

'Bill!' she murmured brokenly. 'Oh Bill! Come back safe!'

Albert, her younger son, aged six and three-quarters, gazed at her in speechless astonishment. He had never seen his mother weep before.

'What are yer cryin' about, murver?' he inquired with childish curiosity.

The woman raised her head from her arms and regarded him with tear-dimmed eyes.

'Halbert!' she said, choking back a sob, 'if you don't hurry you'll be late for school. You'll have to run as it is. Go along, now!'

Albert, utterly mystified, gathered up his slate and books, and ran.

#### CHAPTER II.

The dawn came out of the east in a glare of sulphurous yellow. The sun, blood-red, gigantic, and menacing, overtopped the horizon, and sailed off into space over a thin, translucent film of purple vapour, while the heavens and the wind-flecked ocean were dyed a transient crimson. Then, as the great orb slid slowly upwards and disappeared behind the pall of the upper clouds, sea and sky together took on their customary daylight colouring of dull, monotonous gray.

The sea was the North Sea, and the date June 1, 1916. The battle of Jutland had been fought all through the previous afternoon and night, and that purple and that gray were fitting mourning colours for the brave souls of those who had striven and died for their country. The momentary blaze of scarlet on the sea seemed to be symbolical of their blood.

Save for two small ships punching their way slowly to the westward in the teeth of the rapidly freshening breeze and the rising sea, the ocean, or what there was of it in sight, was untenanted. The cohorts of battleships, the squadrons of battle-cruisers and light cruisers, and the ubiquitous destroyer flotillas of the afternoon before had vanished. A few, with their gallant crews, had gone to their long last sleep in the smoke, flame, and thunder of a hard-fought action; the others, battle-scarred but triumphant, were still somewhere over the rim of the horizon to the eastward, searching the sea for the enemy—an enemy who dared not face the issue of the morn and had retreated from the field of battle. There was not even a friendly feather of smoke on the horizon, nothing but those two badly battered destroyers slowly limping their way home like lamed hounds.

But they, too, were veterans of the fight. Both had taken part in the fierce night attacks on the enemy's fleet—attacks which, delivered at high speed, were at all times desperate, blindfold nightmares in the blackness of the night, and often an appalling, ear-shattering medley of search-lights, spitting gun-flashes, spouting shell, and the awful crash and roar of detonations. They had been amply blooded, and had paid the penalty in damage and casualties; but the ship's company of each of them had experienced the supreme exaltation of knowing that they had played their part in the greatest naval battle the world had ever known. And no mean part either. They had heard the dull, thudding explosion of their torpedoes against the hostile hulls. What more could seamen wish for?

It was nothing short of a miracle that either ship was still afloat to tell the tale, for both had endured a veritable hail of shell from the enemy's guns. The *Mariner*, indeed, the sternmost ship of the two, was little better than a wreck. There were holes in her deck and sides where high-explosive shell and splinters had burst and penetrated. The forecastle plating was mangled and twisted out of all recognition; while the foremost gun, killing, mangling, and crushing as it went, had been hurled from its mounting. The boats were charred, splintered, and useless; while the topmast, taking with it the aerial of the wireless telegraphy, had been shot bodily overboard. The three funnels were torn and perforated by flying slivers until they resembled huge nutmeg-graters, while the stumpy mizzenmast had been shorn off close to the deck. Thanks to hits on and near the water-line, moreover, and to two jagged holes which had opened the wardroom and one mess-deck to the sea, her stern was perilously low in the water and she leant wearily over to starboard.

But, by some merciful intervention of Providence, the *Mariner* had escaped from the inferno without vital damage, and, by the greatest miracle of all, could still steam. All through the night the men of her engine-room department, sometimes working up to their waists in water, had laboured doggedly in plugging leaks and shot-holes, and in effecting temporary repairs to the damaged boilers and machinery. Every other soul on board had worked unremittingly in shoring up threatened bulkheads with planks, mess-stools, and what spars they had, and in doing everything that human skill, knowledge, and ingenuity could suggest. The net result was that their little ship, with her pumps and ejectors working at full pressure to keep down the flow of water, was still tolerably water-tight.

The efficacy of the arrangements made for her safety still remained to be tested. The wind and sea were rising momentarily; the barometer was falling fast, and from the look of the sky there was every prospect of a hard blow from the westward, the very direction in which they were steaming. If they managed to weather it, or to reach shelter before the worst came, well and good; but if the sea became really bad, the *Mariner* and her damaged consort might quite well succumb to their injuries and go to the bottom like perforated kettles.

It was no joyful prospect. The coast of England was fully two hundred miles distant, and no expert, even by the greatest stretch of his imagination, could have passed either the *Mariner* or the *Minx* as seaworthy. But the pair of them had worked together for nearly two years. They were in the same flotilla, had always been in the same subdivision, and were 'chummy ships.' Their officers and men knew each other as friends, and those on board either

vessel derived a certain feeling of companionship and security from the presence of the other. They were comrades in misfortune, and every man knew in his heart that, whatever might happen, their mate would not desert them. If the worst came to the worst, they would all go under together.

So now, their task over, the dawn, which few of those on board had ever expected to see, found the sorry little couple steaming slowly home. They were travelling at little over ten knots, and were supremely thankful that they were moving at all. But two hundred miles at ten knots meant twenty hours' steaming, twenty interminable hours with badly damaged ships in weather which promised to be bad, before they reached the comparative safety of the coast.

The *Mariner* had paid the price. Peter Wooten, her lieutenant-commander, had been wounded in the left arm and grazed across the forehead by flying shell-splinters, though neither of his hurts was serious enough to incapacitate him for duty. MacDonald, the first-lieutenant, was confined to his cabin with more serious injuries; while the wounded—and there were plenty of them—were lying in their hammocks on the mess-decks.

The surgeon-probationer had been busy all night attending to them. He had performed various operations, and the confined space reeked of iodoform. But those men with minor hurts were surprisingly cheerful. It did not seem to occur to their minds that they had been mercifully delivered from the very jaws of death, and they sat up in their hammocks admiring their own and their neighbours' bandages. They smoked innumerable cigarettes, drank cocoa, made fun of their messmates, and asked eager questions as to the results of the battle, what time the ship was expected to arrive in harbour, what would happen to them when she arrived, and how much sick-leave they could reasonably expect out of 'this 'ere.'

They seemed callous in their suffering, and not even the gruesome sight of their own mangled bodies and limbs, or the proximity of badly wounded shipmates sleeping peacefully in their hammocks under the influence of morphia, seemed to depress them. They reminded one, somehow, of what one has read of the aristocrats of the French Revolution, who walked to the scaffold with jests on their lips. They were wonderful.

But your British bluejacket is always wonderful. If somebody drops an empty coal-bag within a few inches of his head and does him no damage whatsoever beyond knocking off his cap, he anathematises loudly and lengthily. If, on the other hand, he is hurt really severely, he hardly opens his mouth, and there was not a man on board the *Mariner* who had uttered a sound while the painful operation of dressing

his wounds was in progress. Only the clenched teeth, the tight lips, and the involuntary opening and closing of the fingers showed the pain they felt. Most of them exhibited a child-like curiosity over their own wounds, and many implored the doctor, with altogether unnecessary insistence, to be quite certain not to lose any shell-fragments he might extract from their bodies. They wanted them as keepsakes. Each one of them, moreover, before having his hurts seen to, begged permission to smoke the inevitable 'fag'—which simple request the doctor, in the kindness of his heart, could hardly refuse.

'Gawd!' an A.B. had remarked, puffing out a cloud of tobacco-smoke as he watched pieces of skin and flesh being trimmed off the badly mutilated fingers of his right hand—'Gawd! it don't 'urt much, some'ow, but when I gets 'ome on a bit o' leaf I'll 'ave to get me li'l sister to feed me. I sha'n't be able to write no more letters to me young lady, neither!'

'Orl right, Ginger,' laughed his next-door neighbour, whose left foot would probably have to be amputated. 'We're townies,\* ain't we? I'll write yer love-letters, if you fetches my beer from the public!'

'Can't 'elp your beer, Nutty,' came the immediate reply. 'My young lady ain't the sort o' gal to carry on wi' the likes of a bloke like you! She's very pertic'lar, she is!'

'Ho! is she?' the other chuckled. 'An' wot abart them other little bits o' fluff that me an' you took to the pictures last time we was ashore together? You didn't tell yer pertic'lar young lady abart them, did yer?'

'Bits o' fluff! Can't a man'—'

'If you two men don't stop talking I'll give you both morphia!' the doctor interjected severely, looking up, scalpel in hand.

'Sorry, sir,' the patient apologised. 'I didn't mean no 'arm.'

The surgeon-probationer grunted. He had little time for unnecessary conversation, and had been working at full pressure all through the night. Except for a cup of strong coffee and a few sandwiches at 3 A.M., he had had neither bite nor sup since luncheon the day before, and had not seen his bed for thirty-six hours. He could hardly keep his eyes open for exhaustion, and longed for a breath of fresh air on deck, but there were still many hours' work before him ere he finished with his wounded.

Presently, as the day wore on, the sub-lieutenant came on to the bridge.

'Shall I get the hands aft now, sir?' he asked his commanding officer. 'Everything's ready.'

Wooten nodded. 'Yes,' he said. 'I'll be down in a minute.'

\* 'Townies'—i.e. living in the same place.

## THE WAR AND THE KIEL CANAL

By G. E. THOMSON, Author of *Prussia's Land of Promise*, &c.

ONE of the determining factors, undoubtedly, in the fixing of the date on which Germany was to precipitate the war which she had made up her mind to provoke was the completion of the alterations in the Kiel Canal, alterations rendered necessary by the universal adoption of the Dreadnought type of warships.

It would be difficult to overestimate the importance of the part played in Germany's schemes by the canal, and it is hard to understand how the authorities failed to recognise it as the menace to Britain which it was intended to be.

Like most of Germany's great ideas for the grasping of power, the plan of the Kaiser Wilhelm Canal originated in the mind of Prince Bismarck. As early as 1873 he proposed the cutting of the channel from the Baltic to the North Sea, and the cession of Heligoland by Great Britain. At that time the suggestion was opposed by Moltke and the military party; but it met with more favour when renewed in 1884. Bismarck had a more wholesome respect for the powers of his opponents than his successors have shown; but he had also a keen sense of the gullibility of the British nation, and of the fatuous benevolence of the Gladstone administration. He dressed his suggestion in philanthropic trappings. 'Heligoland,' he insinuated, 'was useless to Britain as it was, and it would entail senseless expense to make it valuable to her; but it would be of considerable use to Germany, and she was quite prepared to go to the expense of transforming it into a harbour of refuge, which would be of the greatest convenience to Britain in particular, but also to the whole of the world.' The benefit was by no means to be all Germany's. He proposed, he added casually, 'to cut a canal into the Baltic, which would be of inestimable value to Great Britain as the greatest maritime Power of the world, but to that Heligoland was the necessary key.' The transaction, he concluded with his tongue in his cheek, 'would strengthen the good feeling of Germany towards Britain in an extraordinary degree.'

For once he imposed too much upon the credulity of over-confiding statesmen. Lord Granville remarked dryly that 'doubtless the cession of Gibraltar to Spain would strengthen the good feelings of that country also towards us in an extraordinary degree.'

Again the matter was not pressed; but in 1890, when, after many moments of friction, successfully avoided, during the negotiations for the 'partition of Africa,' the Kaiser once more suggested the cession of Heligoland to Germany in return for concessions in Africa, the proposal at length was favourably received. Possibly this was the result of private interference by the

Crown, but there were several weighty reasons which may have influenced the Government. Germany was quarrelsome, and it was essential to avoid bloodshed, if possible, by some small concession, and Heligoland seemed to the Salisbury Government then in power a possession of little value. It was considered inevitable that the island would disappear if left as it was, and the enormous cost deemed essential to save and fortify it would certainly be refused by Parliament; whereas, if Germany thought it worth her while to expend the estimated two million pounds on a mud-bank, it was her affair. The construction of the canal would be of great commercial value to us. Subsequent events proved the cession of Heligoland to be an enormous blunder, and Germany's eagerness might have put the keen-witted on their guard.

The Kaiser lost no time in pushing on the cutting of the Kiel Canal—one of Bismarck's schemes which fell in so superbly with his dreams of vast maritime power that the Kaiser called the canal by his own name. He pulled Bismarck's veil of benevolence even more closely over his plans. The opening ceremony on 18th June 1895 was described by a German writer as 'a magnificent demonstration in favour of peace.' But the Kaiser's own reference to the battle squadrons of the Great Powers that were present as 'a symbol of peace' leaves considerable doubt in the mind as to his exact intentions with regard to the canal, and also his ideas of the constituents of peace—doubt which subsequent events have done nothing to dispel.

It must have been obvious that, whether with peaceful intentions or not, the opening of the canal doubled the efficiency of the German fleet. It also made Germany independent of the Russian Alliance, since she had her own private gateway between the Baltic and the North Sea; so that with insolent indifference she watched the French and Russian fleets steam together into Kiel Harbour for the opening ceremony. Britain was awake now, and aware of the weapon which she had put into her probable enemy's hand. The friction at the time of the Boer war, and our consequent increase in naval construction, imposed a temporary improvement in her tone towards us; but Germany's insolence was mounting steadily, and she also began to build very fast, so that in time Britain came in for her share of it. A certain semblance of cordiality was retained, and in June 1904 a section of the British fleet visited Kiel to witness a regatta arranged by the Kaiser in emulation of the many occasions of the sort on which he had been entertained at Cowes. The visit was not a conspicuous success, and the visitors were subjected to innumerable petty insults.

I quote from a letter received at the time :

'We arrived at Kiel yesterday. You already know my private opinion of the Teuton, and our reception did nothing to improve it. The royal yacht, with the King [Edward VII.] on board, was not subjected to any delay owing to the "locks" not being open ; but the men-o'-war acting as escort were kept waiting several times, and this waiting in narrow waters in a new channel where the soundings are practically unknown requires good seamanship, I can tell you. There can be no doubt that it was done on purpose, because when we arrived at Kiel every Teuton I spoke to made "friendly" inquiries as to whether any ship had bumped. Even their womenfolk were all out, standing on top of the closed locks, and with the most eager interest watching the British ships moving their rudders to keep in the centre of the canal.'

'We're here, you know, ostensibly to watch a regatta, in return for the innumerable shows which the All-Highest has seen at Cowes, but I wouldn't mind staking a month's pay that it is merely to let the natives of the Fatherland have a good look at us at close quarters. As usual, in the presence of royalty all the ships are illuminated at night by means of festoons of electric lamps arranged in various fancy patterns.'

'For various reasons this has not been sent off, and now must wait till we reach port.'

'My impressions of the last four days must even wait until I see you again ; but they are not satisfactory. These people seem out to insult us as much as possible in a pin-pricking fashion. Even the *matelots*, who don't generally worry, have noticed it. For instance, on the night we left Kiel all illuminations which had been ordered to be extinguished at 11 p.m. were put out promptly at that time, although the personal farewells of the sovereigns had been drawn out so much that the *Victoria and Albert* was long after the time given for weighing. The consequence was that the British ships left in darkness to feel their way through the canal, and without a single cheer from the "hosts" with whom they had been "fraternising" for the last four days. It's not "friendly," my friend. There were dinners in the *Victoria and Albert* and the *Hohenzollern*, at which the captains were present, and German ships were told off to look after British ships ; but "fraternising"

was limited to the barest requirements of official etiquette. The privilege of being decorated with the "Pink Crow," otherwise known as the All-Highest's "Order of the Red Eagle," was rather discounted by our skipper's hearing himself and ship's company described as "D—d Englishmen" during the ceremony.'

Small incidents these, but significant.

In 1905 Germany was compelled to begin to widen and deepen the canal to make possible the passage of the new type of warships, whose size had so far outstripped the estimated possibilities of the days when the canal was cut. The first German Dreadnought was launched in 1908.

The insults directed against Britain were not only private and muttered. Military writers in high places were allowed to embellish them without rebuke. Bernhardt disparaged our navy, and in his book *Unsere Zukunft* (1912) frankly acknowledged the purpose of the enlarged canal. 'The Baltic and North Sea Canal will soon be finished,' he says, 'and its completion will yield considerable *military* advantages to Germany.' The fiction of its being mainly of international and commercial use was at length abandoned.

In 1910 Germany had moved her large warships from Kiel to Wilhelmshaven, perceiving that, in an emergency not unlikely to arise, Britain would be a greater menace than Russia. The emergency nearly arose in 1911 ; but the other Powers were reasonable and generous, and Germany, for a sufficient reward in French Congo, proved malleable. Among the several reasons which made her reluctant to force war then, undoubtedly the unfinished state of the Kaiser Wilhelm Canal was first.

The enlarged canal was originally expected to be completed in 1915, when Germany calculated that she would have eighteen Dreadnoughts and super-Dreadnoughts practically ready for sea ; but when other circumstances pointed to 1914 as the favourable year for her to provoke war, the construction of the canal was pushed on with great exertion and additional expense, and was finally completed at midsummer of that year. On naval grounds it had been desirable for Germany to postpone war until then ; naval experts were aware of it, even if politicians insisted on wearing blinkers. At midsummer 1914 she was prepared at all points, and only sought a *casus belli*. On 28th June the Archduke Franz Ferdinand was assassinated.

## PIONEER RAILWAYS IN CHILE.

By J. M. M. CUNNINGHAM.

ITS appearance on the map should be enough in itself to arouse interest in Chile, for in shape it is the most singular of countries. It looks like the caterpillar in *Alice in Wonderland*, 'rearing itself up to its full height ;' only,

Chile, measured from one end to the other, is not, like the caterpillar, 'exactly three inches,' but over two thousand six hundred miles (from about parallel 17° to parallel 56° south latitude). A land of mountains, hemmed between the

higher Andes and the sea, Chile has problems in the way of her development very different from anything encountered in the wide plains of neighbouring Argentina. Yet Chile claims to possess the first railway ever built in South America.

There is a fascination about the history of these early railways in a country like Chile, which has been described as 'at the back of the west wind.' Who first thought of them, and why? Whose hopes or fears were centred upon their success or failure?

However careful may be the survey—and surveys in those early days amid such conditions were unhappily vague—a pioneer railway has always to reckon with the unforeseen. Consequently the history of some of these lines has not been in accord with the original design. We find on the one hand unrealised ambitious projects represented by some small railway of only local importance, and on the other hand modest beginnings which have developed far beyond their original aim, and become part of an international system. Chile has about sixty cross-country railroads. Some are still in course of construction; one, the subject of many years' contention, is abandoned and buried in sand; while three have crossed the mountain barrier of the Andes, one of these three linking up with Buenos Aires, the capital of Argentina, while the other two have direct connection with La Paz, Bolivia's chief city.

A pioneer railway presents in many ways a parallel to human life. 'Can this be So-and-so?' we exclaim, seeing a friend fulfilling some unexpected destiny. 'Who would have thought'—Well, had we known all, perhaps we might have thought, and learned an interesting lesson. See a railway under construction in a difficult country; see hazardous bridges being built, and the rack-rail employed to surmount steep gradients. The character of the line seems conditioned altogether by its environment. But visit it twenty years later, and what a change! By industry and population the whole face of the country has been altered. Environment has been modified, controlled. Mind, and not matter, has become the master.

From its great length, Chile has varied climatic conditions, and, as a result, sharply defined zones of industry. Every one knows that the great source of Chile's revenue is her nitrate, and this is found in the arid north. The climate in the nitrate area is reputed to be delightful. It had need to be! For existence under conditions where nothing grows, and where even water has to be imported, requires amelioration. Darwin described northern Chile as 'the only true desert in the world,' and it is certainly a strange reflection that in the place where nitrate—which is sent all over the world as a fertilising agent—is indigenous, one can grow nothing—absolutely nothing. It follows that the up-traffic on such

railways as serve the nitrate zone has to include all the necessities of life.

The most interesting of Chile's nitrate lines is called 'the Nitrate Railway,' and serves the two ports of Iquique and Pisagua. In the first sixteen miles from the port of Pisagua the line ascends about three thousand feet. Unlike most Chilean railways, which adopt narrow-gauge for mountain-climbing, this line is of the English standard—four feet eight and a half inches. Without a single tunnel, this wonderful little railway doubles and twists over the barren waterless hills, serving some sixty nitrate *oficinas*. It passed into the hands of the present English company in 1882. Originally the concession for the line was held by two Peruvians, for previous to the 'War of the Pacific' (1879–82) the province of Tarapacá was in Peruvian territory. Then indeed the Nitrate Railway had its day, not of financial prosperity, but of the romance of war. During the struggle it inevitably assumed strategic importance, and it is recorded how more than once, to those looking down to the sea from the heights traversed by the line, the shore appeared covered with white sea-birds; and these seeming birds were the dead bodies of men, clad in the white uniform of the Bolivian soldiery.

Looking farther down the map of Chile, one finds, still in the barren nitrate region, the port of Antofagasta, which was at one time a possession of land-locked Bolivia, and which is to-day the starting-point of one of Chile's international lines, the Antofagasta and Bolivia Railway. Some day, when the war is over, and the Panamá Canal does its share in bringing Chile, and, through it, Bolivia, out of isolation, this railway may be known to tourists as it deserves to be. Imagine a line (which for the first twenty years or more of its existence was of only two feet six inches gauge) climbing from the shores of the Pacific to a height of twelve thousand feet, and then running at that altitude across the plateau of the Andes, surrounded by snow-capped volcanic mountains which rise twenty thousand feet, and itself touching levels from which one could look down upon Mont Blanc! Here, surely, is a railway to romance about! Vast wealth lies in the copper and other mines of this region, and by means of a new branch on the Bolivia Railway, the Antofagasta line is now linked with Bolivia's once famous city Potosí, that fabulous treasure-house of the Andes. Here, before the dawn of our civilisation, tribes that have left no written record learned to be miners and artificers. Up and down its mountain of silver for centuries that patient, absurd-looking animal the llama has acted as sole carrier, picking its way cautiously under the loads which enriched ancient Spain. Except for its associations with tin and rubber, Bolivia is an unknown country to most of us. But it may be noted in passing, for the gratification of Scottish readers, that an American

tourist, visiting a strange Bolivian town, was delighted to make the acquaintance of a leading resident in the shape of a Scottish doctor who had been there for many years; and when desiring to go from one remote part of Bolivia to another, he found an easy means of transit in the excellent *diligence* service which a Scotsman maintained there.

The first railway to be built in Chile (and, indeed, in South America, though the Lima Railway contests the distinction) was a line of about fifty miles in length, running from the small port of Caldera to the mining centre of Copiapó, the capital of the province of Atacama. It was begun in March 1850, and formally opened to traffic in January 1852. The scheme had been proposed in 1845 by Juan Mouat, a Chilean, whose name rather suggests Scottish ancestry; but he lacked capital to begin construction, and the credit for building this pioneer railway rests with William Wheelwright, an American engineer, who was also the originator of the Pacific Steam Navigation Company, the capital for which he obtained in London about 1840. Wheelwright was a railroad enthusiast—the name has a singular appropriateness—and was concerned in many construction schemes in other South American countries besides Chile. He had a great project for a Trans-Andine railway which would unite the Pacific and Atlantic oceans by running from the coast of Chile to the coast of Argentina. Long afterwards—in 1910—this project had fulfilment in the completion of the system joining Valparaíso with Buenos Aires. Owing, however, to difficulties with snowfalls on the Chilean Trans-Andine section, through-traffic has been frequently interrupted.

Like the Nitrate Railway, the Copiapó line is of English standard gauge. The track was originally laid with rails from England; the locomotives and rolling-stock were brought from the United States. Of the ten locomotives purchased, one was still in use in 1910; while the engine used on the trial trip, after covering ultimately over seventy-five thousand miles, is now in the National Museum at Santiago.

The immediate objective of this first of South American railways was the exploitation of copper-mines. There were also silver-mines not far off, at Chañarcillo (discovered accidentally by a wood-cutter, Juan Godoy, in 1832), besides low-grade gold, calcium borate, and cobalt. But Wheelwright's aims did not stop short at mining centres. He wanted to build a railway northward from Piquios to Tinogasta, in the Argentine, and the Copiapó Railway Company did actually obtain a concession for such a line in 1874. That it has not been built is scarcely surprising, seeing that it would cross the Andes at an altitude of about fifteen thousand feet. In 1854 the Copiapó Railway, profiting by the copper industry, paid a dividend of 18 per cent. How great was its early prosperity may

be judged from the fact that from 1852 to 1861 the average percentage of expenses to receipts was under 34 per cent.; but in later years expenses rose, while traffic greatly declined, the mining industry languishing. Finally, in 1911, the company sold the railway to the Chilean Government for two hundred and seventy-five thousand pounds, and the line is now incorporated in the State railway system.

We have seen that in the Antofagasta and Bolivia Railway, one branch of which reaches an altitude of fifteen thousand eight hundred and nine feet above sea-level, Chile possesses one of the highest railways in the world. The Republic has also the distinction of possessing the most southerly railway in the world—a little line of five miles in length, running from the town of Punta Arenas, on the northern shore of the Strait of Magellan, to some neighbouring coal-mines. It was built in 1869 to assist the exploitation of the mines; but, as for some years they were not worked, it fell into disuse. It is now again in operation, under the ownership, we understand, of a gentleman of the name of Ross. Do we not again find a suggestion of Scottish ancestry?

One of the busiest lines in Chile to-day is the Valparaíso-Santiago Railway, which connects with the Buenos Aires and Pacific system, through the Trans-Andine sections before mentioned. It is now part of the State system, but was originally worked by a company, and, like the Copiapó Railway, it owed its inception to William Wheelwright. As early as 1841 Wheelwright aimed at constructing rail communications between Santiago, the capital, lying on its inland plateau, seventeen hundred feet above the sea, and the port of Valparaíso, not far distant as the crow flies, but separated from the capital by a confused mass of inhospitable hills. Work on the line was begun in 1852, the year of the opening of the Copiapó Railway. It was finally completed, not by Wheelwright, but by another American engineer, Henry Meiggs, whose name is best known in connection with the Central Railway of Peru. Meiggs also built the first few miles of the railway southward from Santiago. The Valparaíso-Santiago line was so dubious a project when first mooted that an enterprising traveller, Madame Pfeiffer, who was in Chile about 1850, thus expressed herself about it: 'I was not a little astonished on hearing that in this country, where there is yet no post, or any regular means of conveyance from one place to another, a railway was about to be constructed from here to Santiago. The work has been undertaken by an English company, and the necessary measurements have already been begun. As the localities are very mountainous, this will occasion an enormous outlay, quite out of proportion to the present state of trade or the amount of passenger traffic. . . . If by chance ten or fifteen passengers come from Santiago to Valparaíso,

the thing is talked of over the whole town. This has given rise to the belief that the construction of a railroad has merely been seized on as an excuse, in order to enable those concerned to search about the country undisturbed for gold and silver.' To have been accused of such aims would have been painful to a man of Wheelwright's temper, for he seems to have infused into his labours something of a missionary spirit, if we may judge by an incident recorded by Commodore Wilkes, of the United States Exploring Expedition. On visiting Quillota, now a point on the Valparaíso Railway, Wilkes heard that a great bonfire in the market-place had been composed of Bibles which had been distributed by 'our esteemed countryman, Mr William Wheelwright!' To-day various new routes between the capital and the sea-board are in operation or under construction, destined to relieve the congestion on the Valparaíso line, which, contrary to Madame Pfeiffer's expectations, has become excessive; while the port of Valparaíso itself is undergoing reconstruction on an immense scale, at a cost of nearly three millions.

Undoubtedly Chile's debt to outsiders is great, and she has not hesitated to own it. One of her most fertile provinces is named O'Higgins, after the first dictator of the Republic, whose father began life as a penniless Irish boy. A Scotsman, Admiral Lord Cochrane, is ever remembered in Chile as one of the greatest heroes of her struggle for freedom, and one of the most influential in securing it. In addition to this, as we have seen, Anglo-Saxon brains have planned Chile's railways, exploited her minerals, and developed her shipping.

What, then, has been done by the Chileans themselves? The answer is, much; and more is being done daily. The Chileans, now a mixed race, are an ambitious and energetic people, though their energy is not of the 'get-rich-quick' type, but rather intelligent and cultured. The earlier inhabitants of Chile, like the people of northern Britain, can boast of never having been entirely conquered by invaders. Nor has the Chilean Government any intention, however grateful for benefits received, of allowing the country to be exploited without due regard to the promotion of national development.

This policy is shown in no way more remarkably than in regard to the making of railways. The proportion of State-owned and State-operated railways to private railways is enormously greater in Chile than in any other South American state. In 1914 Argentina possessed about three thousand six hundred miles of State lines, and about eighteen thousand miles of lines operated by private companies. In the same year Chile showed about one thousand eight hundred miles of privately owned lines, and about three thousand miles of State-owned lines, not counting the sections in course of construction.

Seeing that the profitable cross-country lines

are nearly all due to private enterprise, with what, then, has the Chilean Government been busy?

Within the past four years the railway map of Chile has been strangely altered. It no longer shows mere isolated lines, pursuing their own ends in indifference to each other. The appearance is rather that of the veining of a leaf, one central line with branches running right and left of it. For the Longitudinal Railway is now an accomplished fact. This railway was initiated and is controlled by the State, and is the concrete manifestation of a policy designed to link the country into an organic whole, to foster new developments, and to derive more advantage for the nation from the industries started by private enterprise. Remember the shape of Chile, and the wisdom of building a longitudinal railway seems so obvious that one might be surprised to hear that time and again the project was nearly abandoned, though always to be taken up again with fresh enthusiasm by some new president or group of engineers and statesmen. But there were many practical reasons that could be urged against a line which, if it ran from north to south without a break, must necessarily pass through unproductive, uninhabited regions, where tremendous difficulties confronted the engineer, and where the industries which might eventually attract population were still unborn. Be that as it may, the construction has been completed, and the intrepid traveller who lands at the port of Pisagua, in Tarapacá, and travels by the Nitrate Railway line to Pintados, may there join the Longitudinal Railway, and continue his journey southward as far as Puerto Montt in Llanquihué (latitude 42 degrees south), a distance, roughly, of two thousand miles. He will pass first over the Northern Longitudinal line, which traverses the nitrate and mineral area, crossing on its way four lines operated by English companies. If, as a Government report estimates, there are about two hundred and twenty million tons of nitrate unexploited in the provinces of Tarapacá and Antofagasta, this industry has still a large future before it. The Northern Longitudinal line likewise serves districts rich in iron, copper, silver, and borax. The chief difficulty in construction arose from the absence of water. The line was built by English engineers, at a contract price of over three millions, and was completed in 1913.

From the terminus of this section the traveller southward passes over what was formerly known as the Chafñaral Railway, then traverses a branch of the Copiapó Railway, and so reaches what is known as the Southern Longitudinal line. Like the northern, the southern section was completed in 1913. The contractors, a well-known English firm, acted in co-operation with a French syndicate. The contract price was four million twenty-six thousand pounds. The country here-

abouts is very mountainous, for the coast-range of hills and the higher Andes meet, and present a formidable barrier to the engineer—how formidable may be judged from the fact that in a total construction of about three hundred and fifty miles there are forty-three miles of rack-rail. The terminus of the Southern Longitudinal Railway is at Cabildo, where there is a junction with a branch-line on the Valparaíso-Santiago Railway, and thus the transit to the capital is completed.

Hitherto the traveller southward has been almost wholly in a barren mineral region, but Santiago lies in the central valley of Chile, a plateau between the coast hills and the Andes, which richly repays the cultivation bestowed on it. The Government has been carrying out construction southward through these fertile regions for about forty years. Quite a network of railways is to be found in the genial, well-watered central zone of Chile, where agriculture and stock-raising flourish, and where the largest towns are to be found. Here, also, on the west, lie the coal-fields, round the busy city of Concepcion, and these are served not only by Government lines, but by the (English) Arauco Company's railway, which skirts the bays of Lota and Coronel. Coronel is important to Chile chiefly in connection with its coal; but for Britain the name has now an unforgettable association of a different nature. It was off Coronel that Sir Christopher Cradock, 'gallantly upholding the high tradition of the British navy,' fell in action on 1st November 1914.

Passing still farther south, always through rich agricultural and wooded districts, the Government main line reaches Antilhue, from which a branch runs westward to Valdivia, at the mouth of the river Calle-Calle. The storming of Valdivia by Admiral Lord Cochrane in 1820 is remembered as one of the greatest events of Chile's war of independence. The modern interest of the town, which has numerous industries, such as copper-smelting, iron-foundries, saw-mills, tanneries, &c., lies in the fact that this is the chief centre of German influence in Chile. Germany has not left South America out of her dream of world-power.

The south of Chile presents a startling contrast to the arid north; the land, broken up into wooded peninsulas and unexplored islands, drops almost below the level of the sea; there is a heavy rainfall, and in the provinces of Valdivia and the still more remote Llanquihue there are numerous large lakes. The forests of Chile will yet be one of her great sources of wealth, but for the most part these vast southern regions still await the pioneer; there are few inhabitants save wandering Indians, excepting in some districts round the Magellan Strait, where sheep-farming is practised. But the extension of the Government line to Puerto Montt, where the traveller may gain some new ideas of the

natural wealth of Chile, marks the opening of a new era. Here, for the present, the Longitudinal system has its terminus.

'A dream,' said the Preacher, 'cometh through the multitude of business.' In another sense he might as truly have said that the multitude of business cometh through a dream, for in such great enterprises even the mere materialist has first his vision—a vision of rough places made plain, and of highways in the desert, highways for 'wayfaring men.' Here, in the Longitudinal Railway, is the dream realised, and as time unfolds Chile's potentialities the 'multitude of business' will follow.

#### THE LAND OF DREAMS.

THE days we love to dream of best  
Are childhood's days lived in the West,  
The dreamer's country.

There wonders are on every hand;  
The streams of that enchanted land  
Make moorland music.

There is the realm where fairies stay;  
Elsewhere we know full well their day  
Is long since over.

There is the spring—'the fairies' well'—  
Hid in the corries where they dwell  
Amid the silence.

At morn, when dews are gleaming wet,  
'Tis there they have their breakfast set  
In secret places.

Round grassy knolls the fairies' ring  
Tells where the Wee Folk dance and sing,  
Could we but see them;

But mists that wreath the lonely glens  
Oft hide the fairy dance from men's  
Rapt gaze of wonder.

The hillman views the western sea,  
Its magic and its mystery  
Girdling the mountains.

The world around him often seems  
Less real than that whereof he dreams  
As he looks seaward.

And if to other lands he sails,  
His loved, lost West he never fails  
To deem the fairest;

For all the men of Real Argile  
And they who love the Misty Isle  
Are haunted ever.

Far, far across estranging seas,  
The old call of the Hebrides  
Fills them with longing

To see the shielings once again,  
The mist-crowned hills, the soft west rain  
Of the dear homeland.

### ON CRANKS.

By LADY SKERRINGTON.

CRANKS are a class of people we have always with us, but there is no doubt that the war has produced a larger and more varied selection than usual. There are so many more openings for them! When the Food Controller suggested food rations, he generously provided them with a vast number of new openings, which, having the charm of complete novelty, were seized upon with avidity. For instance, there is the crank who brings a small pair of scales to the table at every meal, and solemnly weighs every mouthful that he eats. His motives are, no doubt, most estimable, but the result is that all the other people who may be at table are made to feel themselves terribly gluttonous, though they may be merely eating in moderation of the food that has been set before them. The food-weighing crank forgets that it is the duty of the mistress of the house to see that no more than the proper rations are ordered, and that, whilst one person may find it difficult to eat the full amount, another will find it too little; so that, in any average household, one person works in with another.

Then there is the type of crank who shudders over the enormity of eating meat at all. Whenever he is met, he has just discovered a new recipe for some dish that is far nicer and much more nourishing than the most succulent beef-steak. But most of these recipes leave upon the mind a sort of nightmare recollection of weirdly combined ingredients, such as lentils, rice, mashed potatoes, sago, turnips, carrots, and barley, all united by a rich *liaison* of hot water! And if the papers have been specially busy cracking up the merits of oatmeal, a little of that may probably be added to the *omnium gatherum*.

The crank who upholds the merits of the 'simple life' is even more depressing. A raw apple, washed down by a draught of orange-juice, may provide the chemical constituents required to nourish the body, but they would afford cold comfort on a wintry morning. Such suggestions do not appeal to the unregenerate, and they are apt to think with an understanding sympathy of Nebuchadnezzar, and of the criticism that tradition has ascribed to him:

He said, as he surveyed the untempting food,  
'It may be wholesome, but it is not good.'

Of course, the economising crank is well to the fore. This was specially borne in upon me when

I paid a visit to my friend Lady Digby Grant. Hitherto she has had more money and more servants than she seemed quite able to utilise, so her experiences were particularly interesting.

I thought she looked depressed, and said so.

'You would look depressed too if you had had to spend the last few weeks with Digby,' she remarked gloomily, and below my breath I piously thanked Providence that such had not been my fate! To her I expressed my sympathy more tactfully; and she speedily poured out an account of her woes.

'We went away last month,' she said, 'for a little change, as we always do in the spring. But the weather was cold and wet, so that it was impossible to go out much, and to pass the time Digby read magazines and things. I don't know what could have been in them—I was not interested, as I had my knitting—but it must have been something very upsetting.'

'The study of literature is a pernicious habit,' I suggested, and she warmly assented.

'I never guessed, however, that anything was wrong till the day after we got home. It was still very cold, and, as a matter of course, the housemaid lighted the library fire in the morning. Instead of the fire burning properly, however, the smoke came pouring into the room; and when the girl could make nothing of it she ran for Mrs Evans. (She is our housekeeper, you know.) Of course, Mrs Evans guessed at once what was wrong. Those tiresome starlings or jackdaws had taken advantage of our absence to build their nests in the chimney. She told the housemaid to rake out the fire, and said as she left the room that she would send at once for the sweep. Unluckily we were just crossing the hall on the way to breakfast, and Digby heard her. "What's that?" he asked; and when she told him, he was quite angry. He said workmen were not to be sent for to do things, as we must learn to do them for ourselves, and he told Hawkins to find a good stout pole, as he would go and poke down the nests himself after breakfast.

'Hawkins's face was a study; but, of course, he said nothing, and directly breakfast was over we all adjourned to the roof. I went too, because I thought that if Digby was going to scramble about there, I would rather see for myself what was happening than imagine all sorts of horrors

whilst I waited downstairs. The last bit of stair up to the roof is like a wide, rather steep ladder, and I really thought that would stop Digby; but not a bit of it! William pulled in front, and Hawkins pushed behind, and in the end we all emerged into the centre space, which is like a deep valley, with roofs sloping down all round. The housemaid had been told to shout up the library chimney, so that Digby would know which one to attack, and I soon heard a melancholy booing coming from one of the chimneys on the top of the shadiest slope. Digby crossed over and began to climb up to it; and I can assure you, my dear, that I was pretty miserable, as when he got to the top I quite expected to see him topple over on the other side. However, fortunately, he never got so far. He had not noticed that where the tiles were always more or less in the shade, a slimy moss had grown over them; and, all of a sudden, he came down with a crash, and slipped back again into the valley.

'Of course, we all rushed to pick him up, but he must have twisted one of his ankles in falling, and could scarcely stand. So there was an end of his amateur sweep-work; in fact, Hawkins and William had the greatest difficulty in getting him down that horrid little stair. Then the doctor had to be sent for, as I could not be sure that he might not have broken something. So, you see, we spent a lively morning!'

'Yes, and about the chimney?' I asked. 'Was the sweep sent for after all?'

My friend laughed. 'Oh dear, no! Before he left the roof Digby asked Hawkins tentatively if he thought that he could push the nests down; but, to my great relief, Hawkins was quite firm. He said that he had been engaged as butler, with two footmen and a boy under him, but that, as it was war-time, he was quite content to do the work with only the boy William to help him. He had, however, never learnt a sweep's business, and he was perfectly certain that he was too old to begin. Under such circumstances I thought that the sweep might be sent for without more ado, but Digby would not hear of it. He sits clad in his thickest fur motor-coat, with his feet in a large footmuff, and declares that he is quite comfortable; and he is never tired of pointing out what a lot of coal has been saved by not using the fire. I must say I notice that he comes to consult me about small matters a good deal oftener than he used to do, and that on such occasions he stands as close to the fire as possible; but that may be merely a coincidence.'

'And have you ever pointed out that the doctor's fee will be a good deal higher than the sweep's would have been?' I asked.

'No, not yet. I have such a pleasant feeling of reserve power while that suggestion remains unused. I feel that I can produce it at any moment and quench him!'

There are many other varieties of economising

cranks. For instance, there is the variety that economises in pleasures. If you think one of them looks tired, and suggest taking her for a country drive, she looks at you reproachfully and says, 'Thank you. Oh no! I could not go for a mere pleasure drive in war-time,' and, in spite of your good intentions, you feel snubbed quite flat.

Or, again, if you rashly praise some concert to which you have been—probably a charity one—your remarks are received with a studied indifference, and the rejoinder, 'I never go to places of amusement in war-time.'

A number of women have developed into cranks who before the war led luxurious lives, with few occupations beyond their amusements. When these amusements came to an end, some other excitement had to be found, and many of them tried their hands at economies. When a woman who has formerly had a large establishment reduces it to two servants, she cannot merely rejoice over the substantial saving, but can also pat herself on the back for her superior patriotism; and so all is well—except, perhaps, for the discarded servants! But such an upheaval, it is felt, necessitates a radical change in the manner of life; and people shut up their own houses to take small houses or flats that are fitted with all sorts of labour-saving appliances. Judging by the accounts given by some of them of their domestic arrangements, life must be made decidedly uncomfortable for their belongings. One lady announces with pride that they never eat anything but stews, and that meat and vegetables are cooked together, so as to economise in the use of pans and dishes. As pans and dishes are not included in the Food Controller's rations, one wonders why they should be economised.

And so on, and so forth. We have all of us suffered from some form of cranks, and we have, no doubt, each of us inflicted unspeakable boredom upon our friends by our own cranks. In these difficult days it is essential to try to maintain as sane a judgment as possible, and to avoid the temptation to rush off to do some outside work, something quite new, that shall be so engrossing as to take our minds off the sadness that overshadows most things, unless we are certain that no work remains to be done in our homes. We should all help in war work as much as we can, but it must not be at the expense of home duties; and a life of restless excitement can never be desirable. Simplicity of life, curtailment of luxury, a willingness to help others—all these things are admirable. It is only when people allow themselves to be carried away by some predominating idea that a slight haze of absurdity is apt to gather around them.

I do not wish for one moment to suggest that people should try to eliminate enthusiasm from their composition. Enthusiasm, if it is only about growing cabbages, is a valuable asset,

for it helps to keep people young. But a crank is some one who has allowed enthusiasm to run riot, and who has become obsessed by it. If Mrs Brown finds that when she goes to visit Mrs Black, nothing is talked about except the special form of bandages that Mrs Black is making, she will cease to go there. It is an excellent thing to make bandages, but it is just as excellent to be able to forget them in the 'off time;' and if Mrs Brown's own work happens to be in munitions, or canteens, or something else, she will find it difficult to become

suddenly inspired by an absorbing interest in Mrs Black's bandages.

There is a wonderful fund of self-complacency in each of us. Even if it is only that one man has harder bones than his fellows, and so can elbow himself more easily to the front, he will at once take credit for it, and expect those he has elbowed out of his way to admire him! We are all of us apt to be so much engaged adding up the credit side of our ledgers that we quite fail to remember what dull dogs our associates may find us all the time.

## THE FORESTER'S GIRL

### CHAPTER II.

**T**HE merry kling-klung, kling-klung, of a sharply beaten triangle, vibrating in the clear early morning air, found its way through the open windows, setting time, as it were, for the dancing motes of sunshine which gilded Anita Lalonne's white lilies and trod measures on Anita Lalonne's white eyelids. Strange and fantastic indeed were the visions which the magic of mingled mote and music conjured behind the closed lids of the sleeping girl. They wafted her to a far, fair land, where groups of gay people made merry, and danced to the music of a band beneath great flowering chestnut-trees, or gathered around little tables, laughing and eating ices—she among the rest, chattering in a language that flowed rhythmically and sweet from her tongue.

And in and out of their midst passed and repassed the tall Englishman with the grave gray eyes. Always he was carrying something—now a great bunch of faded lilies; now it was herself who, limp and pale, seemed to rest in his arms; then it was not she, but David Hardy, his hair and clothing dripping wet, whom he bore through a ring of staring strangers, gray eyes looking to neither right nor left, head held high, shoulders squarely set, heeding neither the throng of idlers nor (strange indeed!) herself, Anita Lalonne, clinging to his hand and kissing it in a passion of gratitude.

Then the scene changed, and, lo! a circus troupe with a dancing bear, every one clapping and applauding the antics of the poor beast, until suddenly through the crowd again this Englishman shouldered his way, levelled his gun at the creature, and it leapt forward—not a bear in chains, but a great tawny lion! Anita awoke with a scream. Yet in the little room that gradually shaped itself before her bewildered eyes there brooded only peace, sunshine, and pale-pink curtains fluttering with a feeble fluff-fluffing sound; and the dear desert lilies; and—yes!—a penetrating, familiar odour which instantly roused in Anita a wholly inconsequent but renewed sense of joy in life.

Sniff—sniff. 'Coffee! and fish frying! My gracious, but I'm hungry!' she cried, springing out of bed and thrusting her small pink toes into their stockings. 'Wonder if I'm awful late, as Mr Axel would say; and have I time to do my hair properly? No, I guess not,' she chattered on. 'Doesn't matter, 'cause I look just as pretty with it the other way;' for Anita made no demur at admitting herself to be pretty, as, indeed, she undoubtedly was.

Then, while she brushed and twisted up her hair, and shook out the dainty blouse with its lavish sprinkling of tiny rosebuds, her mind ran riot as to the coming of David. When? How? Would he leave her here for a day or two, or take her at once to the people with whom she was to stay until—her white fingers stopped short in the very act of fitting a diminutive button into its diminutive hole—impossible to realise she was on her way to be married—not to come out of these woods again until she had been David Hardy's wife for ever and ever so long!

Her reveries, however, were suddenly put to flight by a second violent kling-klunging of the triangle, announcing that breakfast was ready; so, hurriedly completing her toilet by tucking a lily into the loops of a black-velvet bow against her neck, bare where a lace-edged collar rolled away from it, she removed the barricade from her door, and stepped out into the first chapter of her forest life. Very encouraging it now looked in the bright sunlight—all the dread shadows dispersed, tents of gleaming white canvas replacing the gray ghosts of the previous evening, tempting vistas of tender green and ruddy red instead of the thick pall-like draperies of Dame Night; and everywhere the cheery sound of cow-bells, of horses stamping and munching hay, of some one winding up the zinc bucket from the deep, roofed well. And now here comes 'Bob,' her canine acquaintance of the long, hot journey, pleased to recognise her, and wagging his feathery tail.

Anita, her eyes sparkling with pleasure,

stopped to pat the dog, and her ears caught the sound of voices behind her down the aisle of towering trees—the far-carrying voice of Charlie, and the low-pitched replies of the two Englishmen.

'I'm *awful* sorry,' Charlie was saying, 'cause it would be such a gute day for you to try de river; an' I don't suppose Mister Barrie'll want to go widout you, Doctor Grey. But you know,' he went on in his usual jovial fashion, 'if you will be a *doctor* and come to dese parts, where doctors' visits is as scarce as angels', you mustn't expect to spend all your time *fishin'*; you'll have to work some too! And dot's an awful nice leetle poy of Missis Burke. He's de *only* one—too bat he broke his arm.'

'Oh, I'll soon make *that* all right,' rejoined the doctor; 'and there will be many more days to fish.—But, Gavin,' he went on, addressing his friend, 'you had better not wait for me if Charlie thinks this is the right sort of day for the river.'

'No indeed,' said Gavin. 'I'll poke about here, and have a try in the What-do-you-call-it Creek which Charlie was telling us about. Can't say that I personally saw any trout swimming around my tent!—I thought you said we stepped out of bed into the stream, Charlie,' he went on chaffingly as the three men followed Anita into the log cabin, and were confronted by a lavish breakfast, served 'hot and hot' from the kitchen by the blonde Swede in the long apron.

Fried fish, fried potatoes, fried venison-steaks (masquerading on the station menu as 'goat'), fried 'hot cakes' to be smothered in slabs of butter and streams of syrup; peaches, too, piled high; and great sections of frosty-red water-melon. The Englishmen's stomachs fairly ached in sympathy with those of a row of brown-faced, rough-bearded men, who forged ahead from fish to finish without a break. It was all very wonderful to behold. But when, on top of a three-quarter segment of ice-cold water-melon, one great fellow poured down a monster cup of scalding-hot coffee, Gavin Barrie could scarce repress a groan, prodded Kenneth Grey, and together they burst forth into the fresh air, and speedily lit their pipes.

'Great heavens!' exclaimed Barrie; 'did you ever see such a feed? But that "goat" isn't "hard to take," is it, Ken? The rascal! I suppose he hasn't the vaguest notion of keeping the game-laws.'

'Game-laws!' echoed Grey. 'I should say *not*. They're a curious people out here. I gathered a good deal about them from that Sacramento man on our train. They pride themselves on holding the franchise and making laws "*for* the people, *by* the people," as they say, yet chafe at the bit whenever their own mouths feel the rein tighten. That is where the Government is up against it with regard to

the forest fires. Spends thousands of dollars a year on all sorts of precautions—foresters, observation posts, wireless, and so on—and pays out no end of money to people to beat out fires when they do start; yet, in spite of all *that*, and the ghastly destruction of life and property when one of those wholesale conflagrations gets really going, there are plenty of people still who vow the country was in better shape when the Indians had it, and burned the bush off every year or so. Of course, they are chiefly cattle-owners, who hanker after the days of tremendously wide ranges, and they can't see beyond the horns of their own steers—don't care a hang if every tree in the state is burned off, so long as they can raise their calves and line their own pockets at the nation's expense. Did you see how the notices nailed on trees as to camp fires, and throwing away lighted matches, and so on, which the Government posts in every direction, are half of them defaced or riddled with shot, if not torn off altogether? Charlie told me that this happened so constantly to paper notices that the Forestry Department tried tin ones! But they got over *that* little dodge by getting out their hatchets! Rum lot! But I say, Gavin; I mustn't stand jawing here any longer,' Grey interrupted himself, 'or before I get over to Silver Creek that poor little kid's arm will have set *itself*. Come along to the stable and see what sort of a plug Charlie proposes for me to ride. Hope to goodness he may go one better than those wretched beasts we had yesterday.'

A few moments later the doctor, mounted on a horse whose anatomy, if erring on the score of heavy weight, was at least sound and fairly well covered, adjusted his feet in the unaccustomed 'long' stirrup, strapped his medicine-kit behind the heavy Mexican saddle, pulled a wry face at his friend, and calling back to him, 'Who would be a doctor in the trout season?' headed his Brobdingnagian steed towards the long, cross-country trail to Silver Creek.

For a short time Gavin Barrie, thus left to his own devices, wandered about the station, one eye scanning fresh details of the novel surroundings, the other on the look-out for the red-brown dog, which, far more interested in the quest for food than for his canine enemies of the night before, seized every opportunity to elude his master and plunge his head into the garbage-pail. Even the pig-sty—if the trampled corral and hollowed log which served as trough, placed in a remote corner of the clearing, could be so called—had been speedily discovered; and it was from a raid in that direction that 'Bob' now returned, his drooping, curly ears and brown snout dully shining with fat and skim-milk, a bone of the Eocene age in his jaws, and his tail at half-mast, expressing both pride and apology.

'"Bob," you scoundrel! What the dickens have you got hold of now?' exclaimed his master—

with ill-assumed wrath. 'Let me see it! Beastly old bone; but I suppose, if it isn't too filthy, you may fetch it along to the tent. But you are a *hog*, you know. Come along!' and, followed by the dog in a cheerfully acquiescent frame of mind because of the half-hearted permission to retain his treasure, Gavin made for his tent, and set to work on the ever-joyous task of arranging his rod and tackle.

Presently his attention was diverted from the delicate business of tying on flies by the trample of horses and voices of men, which gradually, out of a cloud of red dust, took substance on the road from the mountains, passing through Grizzly Station, and joining that by which Barrie had travelled the previous day. As they clattered up to the well-trodden path to give their thirsty horses a drink, he saw the cabin door open and the girl Lalonne dart out, only to stop abruptly as the dark, eager eyes swept the group of newcomers, and failed to discover the man she sought.

Barrie, who at breakfast had scarcely noticed the girl, a number of men being seated between them, suddenly remembered how Charlie had chaffed her on the subject of her approaching marriage, and thus divining the cause of her sudden egress and abrupt halt, felt a rush of sympathy for her.

'Tough luck!' he was saying to himself, when one of the strangers dismounted and came forward, as Charlie, intent upon the refilling of his perpetual pipe, appeared at the door of the bar-room.

'Hullo, Natty!' he called out; 'you're de early birt! How's t'ings up your way?' Then, catching sight of Anita Lalonne, standing aloof and dejected, he went on: 'Have you heard anyt'ing of Dave Hardy lately? Dere's a young leddy here very partic'lar anxious to see him.—Mees Lalonne, let me introduce you to Mr Nat Duncan. Mr Duncan has bin in with a great lot o' goats, Mees Lalonne, beyont where Dave is, so maybe he's got news for you.'

The man called Nat pulled off his sombrero, saying, 'Pleased to meet you, Miss Lalonne; and I reckon you're the young lady I'm lookin' for. Here's a letter for you from the forester—him bein' Dave Hardy, eh, Charlie?'

'Yes, yes,' cried Anita, not waiting for Charlie to answer. 'Please give me the letter—quick!' and, clasping it in both hands, she ran back to her room, perched herself on the steps, and tore open the envelope.

With shining eyes she read as follows:

'DARLING ANNIE,—I'm heart-broke not being able to meet you, but Jim Niel (that's the forester at Rainbow) is sick, and there ain't another soul but me to look after him. Of course, you understand he lives all alone, like me; though, thank God, I won't have to say that much longer, shall I, Annie darling? I

have to see to his (Jim's) section as well as my own till he's some better, and as it's just about now that campers is all over the place, starting and leaving their fires burning, I can't come down to the "Grizzly" even in the night, as I would if I could, as you know; don't you, Annie darling? Now I can't keep this fellow waiting, so here's the letter. If I can't get down for a few days, you just stay with the Axels; they're real kind. I bet you're prettier than ever!—Yours sincerely,

D. B. HARDY.'

Then, scrawled hastily under the signature:

'AND ADORING DAVE.'

Anita read and re-read the ill-written letter, conflicting emotions swelling her heart, reflected in the beautiful dark eyes and in the colour that burned in her cheeks—bitter disappointment, sympathy for poor David, then a flood of radiant joy over his homely expressions of devotion and longing for her.

Sitting thus, the letter in her lap, her tiny hands clasped over her knee, the girl for the first time seriously caught the attention of Gavin Barrie, just emerging, creel in hand, from his tent. Up to that moment she had not interested him in the least, the gathering and gift of flowers when they were fellow-passengers in Charlie's wagon being merely one of the sudden impulses indicative of a deep-lying *tendresse*, which from boyhood he had endeavoured to mask. Now, however, the thought suddenly struck him that the girl was pretty; more than pretty—piquant, with a suggestion about her of something (his mind searched the corners for an explanation) not belonging to this far western world in which he and she were moving. Her hair, now that it was dressed decently (so his thoughts ran), was distinctly beautiful—heavy, lustrous-black, and softly framing the oval of her face and the small, well-shaped head. Her colouring—rather foreign, wasn't it?—reminded him of—What the dickens *did* it remind him of? Ah!—of course; and that, too, would account for the subtle daintiness of her dress—the *chic* blouse gathered over a full, rounded bosom into a narrow patent-leather belt—black, like her hair and the velvet bow at her neck. Her waist was too obviously small; her hands, though white and pretty, were not those of a lady; the high-heeled shoes were ridiculous. Where had she come from—this girl whom, with a trifle of imagination superimposed, one might conceive to have stepped out of the pages of *La Vie Parisienne*?

But the Englishman's newly kindled interest was fated to subside as quickly as it had flamed, for at sight of Charlie and the men coming out of the bar-room and preparing to cinch up their horses, Anita jumped up, and running lightly towards them, called out, 'I say, Mr Axel, I've heard from Dave, and he ain't coming for several days. That's one on Anita Lalonne, ain't it?'

and she laughed gaily; then rattled on: 'The other forester's sick, and he can't get away, the poor old dear; so I guess you and Mrs Axel will have to keep me a little longer. Too bad, ain't it?'

All the men gathered around her, laughing and chaffing, albeit in their free-and-easy manner there was no shadow of disrespect or offensive familiarity. Gavin Barrie could hear the man, Nat Duncan, who had brought the forester's letter, suggesting she should be ready, against his return, to ride in with him and give David a surprise.

'I'll pack you along on my saddle,' he joked. "'Joe" here'—and he gave the cinch an extra pull with his knotty hands, making the big roan fling his head round with snapping teeth—'he wouldn't know the difference 'tween you and a butterfly on his back. Will you come?'

But the girl shook her head, giving occasion for further outbursts of mirth and good-natured rallying of Nat, until he and his companions, waving their hats to Anita, and promising to take either herself or a letter to the 'love-sick forester' (more laughter), when they should return the following day, disappeared down the road.

Barrie's handsome mouth gave a wry twist. The whole incident, somehow, jarred upon him.

'Why couldn't she keep it to herself?' he reflected with disgust, adding sententiously ere he dismissed her from his mind, 'I might have expected it.'

For, as regards women, it was an inherent characteristic of this rather complex young Englishman that he was exceedingly fastidious, a trait presumably part and parcel of a subtly artistic temperament which, recognising in himself, he heartily detested, and strove to strangle as though it were a vice. Over against this lay, as it were, a streak of curious inertia, a sort of moral laziness, responsible for his becoming at the university, and later at the *École* in Paris, a pleasant, unprotesting companion to such of his friends as happened to tread in devious ways. Yet only up to a certain point. Then the fastidiousness stepped in, and saved him, a young man of attractive personality and liberal

purse, from committing any of the more serious follies which so often wreck the lives of such as he.

Had his mother, the descendant of a goodly line of artists, recognised in her son this special grace inherited from herself, she might have been spared many anxious prayers and tears during his early manhood; but herself the victim of a very Lothario of a husband, she lived in terror lest Gavin also fall by the way, and misconstrued a harmless, if lazy, compliance into the damnable weakness of the 'easily led.' His father's constitutional secretiveness, too, her apprehensions imagined to be reproduced in the husk of reserve in which her eldest son seemed to wrap himself—a reserve in reality wholly superficial, and due to this same streak of inertia that made the usual chatter about trifles a bore to him. By the grace of God, so his pious mother faithfully believed, her weak but lovable son would be preserved from the snares which beset the paths of youth, and among 'perils in the cities.' That the Almighty, through the instrumentality of her own flesh and blood, had thus equipped him to face and fell his fiercest foe, she had no conception, for of those hard-fought battles Gavin Barrie was not the man to speak.

So it was that the appeal which for a moment the piquant personality of Anita Lalonne had made to a certain side of his nature was at once counteracted by the eagerness and lack of reserve with which she chattered to these strange men of her sweetheart and prospective marriage, together with a certain crudity of speech, a sweet voice and rather pretty accent notwithstanding.

Removing his fishing-tackle to the rear of the tent, with unconfessed intent to avoid meeting the girl, this hypercritical young scion of the British race hurriedly finished his preparations, and calling his dog, strode rapidly away, down a steep, rough path leading from the station to Bear Creek. There, in the all-absorbing business of safe-guarding rod and line in the dense growth which, to the angler's grievous hindrance, closely barricaded those wilderness streams, he speedily forgot the very existence of Anita Lalonne.

(Continued on page 41.)

## LIGHT, HEAT, AND POWER OF THE FUTURE.

By E. FEARON.

ONE of the essential requirements of the present day, and one that will be more than ever essential in the future, is a cheap and clean form of heat and power in the factory, in the office, &c., and in the home, and signs are not wanting that a radical change is taking place, especially in the north of England, in this respect, and that the dream of many scientists of supplying these direct from the coalfield to the consumer

may yet come true. A survey of what has been done in America and on the Continent, and of what is taking place in our own country, is of particular interest just now, with the existence of State control of the collieries, the demand for increased supplies of motor fuel, and recent legislation respecting the supply of town's gas.

For years we have lagged behind Continental practice, and it is high time that in this, not to

mention other matters, Parliament should take the lead and formulate a policy for the whole country, instead of hindering progress, as has been done in the past. Nearly twenty years ago Germany had abandoned the illuminating power fetish, and allowed municipalities and companies to supply a practically non-luminous gas, only stipulating a standard calorific—that is, heating—value. Here, on the other hand, thousands upon thousands of pounds have been spent in obtaining parliamentary sanction to lower the illuminating power, and it was not till the war compelled us to obtain all the benzol and toluol possible that a Bill was brought forward to enable gas to be sold upon a common-sense basis—namely, upon the amount of heat it contains. The long-drawn-out discussions that have taken place, the array of counsel, the expense and worry of arguing the pros and cons, would be Gilbertian if they were not symbolic of our whole system of industrial inefficiency, and too serious a matter for the country at large. However, this is not the place, perhaps, for a diatribe on this aspect of the affair, but it is so bound up with the question that to avoid referring to it is not easy.

Briefly, the history of the subject is as follows. Gas for lighting purposes was first produced from coal, on a commercial scale, a little over a hundred years ago, and as the means for obtaining the required light depended upon the luminosity of the flame, it was necessary to retain in the gas the light-giving bodies called hydrocarbons, consisting of benzene, ethylene, &c. The invention of the Bunsen burner and the Welsbach mantle put a different aspect on the whole business, as it now became merely a matter of heating-power; but, even so, it has taken us all these years to realise the fact. Comment is almost superfluous!

Of late years many of the collieries have put up coke-oven plants at the pit-head, in which the hard metallurgical coke used for iron-smelting is made; large quantities of gas are driven off during the coking process, and as only about half of it is needed for heating the chambers, boilers, &c., and driving any gas-engines employed, the other half was generally burnt to waste. Well, it is no use crying over spilt milk, and it seems as if stern necessity was beginning to make us economical in spite of ourselves, so that when a startlingly cheap form of potential power is being allowed, quite unnecessarily, to light up the surrounding country, it is at last beginning to dawn on the intellect of a few bold spirits that it might be as well to utilise this power for the good of mankind, and, *mirabile dictu*, this is actually being done!

The figures relating to the industry for 1913 are the latest available, and on turning to them we find that thirteen thousand one hundred and sixty-seven beehive ovens and seven thousand eight hundred and thirty-nine by-product ovens were in operation, the former consuming some eight million tons of coal, and the latter twelve

million, a total of twenty million tons per annum. The state of things shown by the foregoing figures is alone sufficient to make us ashamed of ourselves as a scientific and progressive nation, for the Huns, as the daily press is so fond of calling our chief adversary, have only *one* beehive oven in the country, and that is kept as a curiosity and an awful example of 'how not to do it.' Incidentally, it would be most interesting to know what our backwardness and lack of enterprise in these matters has cost the country in men and money since August 1914. Of course, all this is going to be altered 'after the war,' so perhaps criticism must be reserved for the time being.

Still, the facts are there; and put into hard cash it amounts to this: twelve million tons of coal are carbonised in a scientific way, producing one hundred and forty-four thousand million cubic feet of gas, half of which, seventy-two thousand million feet, are available for power and other purposes at something like twopence a thousand feet; also the tar, ammonia, benzol, &c. are recovered. Now, eight million tons are carbonised in a wasteful, unscientific manner, and all that is obtained is some five millions tons of coke, the tar, ammonia, benzol, and gas being lost to the value of nearly three million pounds. The twenty million gallons of benzol would be particularly acceptable just now.

However, as beehive ovens, like a good many other uneconomical pieces of apparatus of pre-war days, will have to be remorselessly scrapped, and their place taken by recovery plants, we shall have ultimately some one hundred and twenty thousand million cubic feet of gas available, of a calorific value of about four hundred and fifty to five hundred B.Th.U., which could be sold at, say, twopence halfpenny per thousand feet. As most of the large industrial concerns, such as engineering works, ship-building yards, iron and steel works, &c., are situated in the north of England, and within reasonable distance of the collieries, there is at hand a source of energy which ought to be a tremendous help to them. Let us consider what happens at present. Sixty-five million tons of coal are used for power production each year, and if we assume that the boilers, engines, &c. are of an efficient type, we should expect to obtain, say, sixty thousand million horse-power from this quantity of coal, and if we take one pound a ton as a fair figure for coal, the cost works out at .26 penny per horse-power. In the case of coke-oven gas at twopence halfpenny per thousand cubic feet at the colliery, assuming it to be distributed by means of high-pressure mains, it could be sold to consumers at, say, fivepence per thousand, and if used in modern gas-engines would provide power at a cost of .10 penny per horse-power; or alternatively, if used for firing a boiler, and producing the requisite power by means of a steam-turbine, it

would cost a trifle more—say .14 penny. The choice would be largely governed by the output required, the latter method being the better where twenty thousand horse-power and over is desired. Under the conditions prevailing in 1913 this would represent about 10 per cent. of the total horse-power required; but as a great increase may be expected in all large industrial concerns when peace is restored, there is little doubt that 20 or 25 per cent. of the requisite power could be supplied in this way. However, if we take the amount at 10 per cent., then six thousand million horse-power at .26 penny would cost six million five hundred thousand pounds, and with coke-oven gas at the figure stated two million five hundred thousand pounds, a clear gain of four million pounds a year, which would go a good way to reducing costs.

Another scheme by which cheap power and light could be distributed from colliery districts to almost any part of Britain is by means of electricity at high voltage. This is practically an unknown quantity in Great Britain, but if we turn to California and the Western Pacific coast, we find that it is transmitted to great distances, even up to two hundred miles, San Francisco, for instance, being supplied with power from the generating station of the Standard Electric Company, one hundred and fifty-four miles away. In Mexico, the town of San Luis Potosi gets its power from a generating station two hundred miles away, the voltage employed being one hundred thousand. The mighty Niagara Falls, which are estimated to be able to yield five million horse-power, transmit power to Syracuse, a distance of one hundred and fifty miles, at sixty thousand volts; Rio de Janeiro, a city larger than Manchester, obtains its light and power from a source fifty miles distant. Numerous other instances could be given of towns in different parts of the world which are supplied on similar lines, and many electricians speak confidently of a time when power will be transmitted, at two hundred thousand volts, to distances upwards of four hundred miles.

In Great Britain ten thousand volts are regarded as rather daring, and even this comparatively low-pressure supply has not been exploited to any great extent; but, with increasing cost of coal, some scheme of light and power supply, such as is in existence abroad, is bound to make its appearance before long. 'Tis a consummation devoutly to be wished; we have endured fogs and dirt far too long already, and any scheme which will help to banish them will be welcomed. To some extent a start has already been made on the lines suggested, and a brief account of what has been done may serve to show the possibilities that are latent.

In England, Middlesbrough, a town of some one hundred and ten thousand inhabitants, is the first town of any size to secure a supply of

coke-oven gas and distribute it through the town's mains in place of gas made at their own works. The gas is obtained from Messrs Sir B. Samuelson & Co., Limited, of the Newport Iron Works, and has a net calorific value of about six hundred B.Th.U.; the corporation can obtain one million six hundred thousand cubic feet per day, and has been so supplied without any trouble since October 1914.

The Sheffield Gas Company, which before the war were supplying gas to large consumers at tenpence a thousand feet, are now asking Parliament for authorisation to purchase 'coke-oven gas and gas in a crude and unpurified form;' and, doubtless, other companies and corporations will follow suit.

After all, it is no more than a common-sense proposition. For years past the coal has been raised at the pit, filled into wagons, conveyed by rail or boat to the works, there unloaded into bunkers, and finally fed into retorts or used for heating boilers. Does it not seem a much simpler and more economical method to manufacture the gas on the spot, so avoiding carriage and handling, and then either distribute it at high pressure to the place where it is wanted, or convert it directly into electricity and distribute it?

The North-East Coast power scheme is a good example of what may be achieved in this direction. Here you have an area with a population of some two and a-half millions, which produces about 20 per cent. of the coal and 40 per cent. of the iron raised or made in the whole kingdom, and by utilising coke-oven or black-furnace gases, it supplies electricity in bulk to towns and urban districts at prices considerably less than any local authority could do.

Some two hundred and twenty thousand horse-power is generated, and most of the large industrial establishments—including iron and steel works, engineering shops, shipbuilding yards, &c.—obtain their power in this way, as do many tramway companies. It has resulted in a great reduction of smoke throughout the district, economy of fuel, and much cheaper power than could be obtained by small and scattered units working independently.

Since it has been definitely proved that it is possible to provide power, light, and heat on this comparatively large scale, and since the experience of the towns quoted shows that there are no insuperable difficulties in the way of long-distance electric transmission, it becomes merely a matter of time till even London itself may be lighted and heated and derive its power from the coalfields of Lancashire or Yorkshire, and we should then be able to erect buildings which would retain their pristine freshness, the eternal fight against dirt that breaks the hearts of millions of women would be very considerably lessened, and in every conceivable way the lot of the poor and the lower middle-class would be enormously improved.

It is, naturally, difficult to say at what price gas or electricity generated at the colliery could be supplied one hundred and fifty or two hundred miles away, but there is little doubt it would be a good deal less than that at which any individual concern could supply them. As a cheap supply of energy, in one form or another, is becoming more and more essential, especially if our industries are to increase and compete with those of other countries after the war, it may be as well to consider what might be done if the whole of the coal at present used in the raw state were gasified in the colliery districts.

If we take the figures for 1913, and deduct the quantity used by gas-works, coke-oven plants, railways, &c., we have one hundred and thirty million tons used in various industries, in domestic heating, and so on. Now, to handle the one hundred and thirty million tons, and transport them all over the country, requires a great number of men, and is a very costly business indeed; and although small towns and villages could scarcely hope to participate in the advantages that would accrue if the coal were gasified, it will be safe to assume that the large towns of England use about one hundred million tons of raw coal a year. From this quantity of coal some two hundred and fifty million gallons of benzol could be obtained, and as, for all practical purposes, it is as good as, if not better than, petrol for internal combustion engines, and as motor vehicles of all sorts, aeroplanes, &c. will be increasingly used, there is here some solution of the petrol problem. Just before war broke out, we had to import one hundred million

gallons of petrol a year, and as the supply is limited, prices are already six times what they were a few years ago. Moreover, the supplies of petrol are by no means inexhaustible, and with increasing demand for it in the countries which contain petroleum, there is every likelihood of a petrol famine in Great Britain in the near future. Nitrogen, again, is a necessity of modern life either as nitric acid or as sulphate of ammonia, and of this we should secure some three hundred thousand tons; also about a million tons of sulphur, which could be converted into three million tons of sulphuric acid, for which there is an ever-increasing demand. From every point of view, such a scheme would be an advantage to the whole community, and if 'the powers that be' will only take this, and other matters, in hand, Britain will reap *some* benefit from the sacrifices she has been called upon to make. In conclusion, it may be pointed out, as significant of a good deal, that the majority of the coke-oven plants are of German origin, and were erected here under German supervision, and one of the stipulations made was that the benzol should be returned to Germany.

Do let us wake up to the fact that in our own country we have the brains and the energy to supply our needs for a great number of things which we obtained from Germany; but Parliament must give encouragement in every possible way to manufacturers, scientists, and others, else there is great danger of our once more depending upon outside sources of supply, and we shall have failed to learn the lesson of this terrible war.

## THE 'MARINER'S' RETURN.

### CHAPTER III.

THE bell tolled mournfully, and every member of the ship's company who could be spared from his duty went silently aft to the quarter-deck. They were clad in their ordinary sea-going clothes, the clothes they had fought in—some in sea-boots, mufflers, and thick 'lammy coats'; others in fearnought stokehold garments or greasy overalls, just as they had come from their work. Not a few wore bandages; while they were all uncouth-looking, unshaven, and dirty, their tense expressions and tired eyes showing something of the ordeal through which they had passed.

Aft, in the stern, under a brand-new White Ensign fluttering at half-mast from a spar doing temporary duty as an ensign-staff, was a heap covered over with the red, white, and blue folds of all the Union-Jacks and White Ensigns they had been able to find. A puff of wind filched the bunting covering to one side, to disclose long, shapeless bundles sewn up in canvas. There were eight of them. They were the

*Mariner's* gallant dead, who, with practice projectiles at their feet, were awaiting burial.

The men, fallen in in their ranks, glanced at them out of the corners of their eyes, and then averted their gaze. There lay the mortal remains of eight of their shipmates—men they had lived with and had known well; men they had been wont to call by their nicknames, and who, a short four-and-twenty hours before, had been alive and well like themselves. Now they were merely bundles of flesh sewn up in coarse canvas.

Never again would they hear the hoarse, barking laugh of 'Paddy' Taylor. Never again would they see old 'Chats' Harris, able seaman, grumbling away to himself on the mess-deck as he twirled the handle of his antiquated sewing-machine. No more would 'Orace' Walker play his accordion, or 'Nosey' Parker indite his letters aloud to his wife and his three children.

No. Paddy, Chats, 'Orace, Nosey, and the others had finished with this world. The

*Mariner* would never see them again. They were dead, and even now their spirits were in some mysterious place called Paradise; while presently all that remained of their mortal bodies would be committed to the deep. And at home in England wives, sweethearts, relations, and friends were confidently awaiting their return, and counting the days till they came on leave again. . . . They would never return.

Dead! It seemed impossible!

There was not a man in that hushed little group on the quarter-deck who did not feel the solemnity of it, who was not thinking of how nearly he himself had escaped being one of those shrouded forms in its hammock with a shot at his feet.

Wooten stopped the ship, clambered painfully down from the bridge, and reappeared on the quarter-deck with a prayer-book.

'Ship's company—'shun!' from the sub-lieutenant. 'Off caps!'

The lieutenant-commander, a bandage round his head and his left arm in a sling, stepped into their midst. He stood there for a moment, swaying to the easy rolling of the ship, while the wind fluttered the leaves of the book in his hand. Then he began to read.

"I am the resurrection and the life, saith the Lord: he that believeth in Me, though he were dead, yet shall he live: and whosoever liveth and believeth in Me shall never die.

"Man that is born of a woman hath but a short time to live, and is full of misery' . . . he continued huskily, while the men, some of them with tears in their eyes, looked down towards the deck.

Then came the awful moment.

"Forasmuch as it hath pleased Almighty God of His great mercy to take unto Himself the souls of our dear brothers here departed"—the reader paused and looked up, while a petty-officer and three men turned back the bunting, placed the first hammock reverently on a mess-table, and approached the ship's side—"we therefore commit their bodies to the deep, to be turned into corruption, looking for the resurrection of the body (when the sea shall give up her dead)" . . . .

Wooten nodded, and the four bearers, swaying uneasily under their burden, tilted the mess-table. The laden hammock hung for a moment, and then slid off and dropped overboard with an agonising 'plop,' to vanish in the gray-green water in a little splash of spray and a few bubbles breaking on the surface.

The other seven followed. . . . Somebody in the rear rank started to sob audibly.

"I heard a voice from heaven, saying unto me, write, From henceforth blessed are the dead which die in the Lord: even so saith the Spirit: for they rest from their labours."

Wooten, with a lump in his throat, read through the remainder of the service, and

nodded to the sub-lieutenant after the final 'Amen.'

'Ship's company—on caps!' came the order.

The commanding-officer, still bareheaded, ran his eye up and down the ranks. He felt he ought to say something, but could hardly trust himself to speak without breaking down.

'Men,' he said at last, drawing himself up, 'I want to thank you all for what you did yesterday and the splendid way you behaved. I'm proud of you, and proud of being your commanding-officer. I'—He hesitated. 'I can't say any more now,' he added, a suspicious tremor in his voice; 'but I can't tell you how proud I am. —Dismiss the ship's company, Mr Hargreaves.'

The simple words, spoken straight from his heart, touched his hearers. The men went forward silently.

There had been none of the pomp and circumstance of an ordinary naval funeral. There was no gun-carriage followed by the mourners, no band playing the 'Dead March,' no three volleys fired over the grave, no 'Last Post' sounded on the bugles. Nothing but a battle-scarred little ship rolling uneasily to the sea, the gray ocean, and the splashes of vivid colour in the half-masted White Ensign fluttering bravely against its background of leaden sky. There was no pomp and circumstance, but none the less the pathetic scene had been solemn and impressive.

And at home in England women wept and women waited in agonising suspense—waited, in many cases, for those who would never return.

#### CHAPTER IV.

The weather grew steadily worse, and at sundown the same evening, by which time the crippled pair were still some seventy miles from the coast, the wind and sea had risen alarmingly. The *Minx*, not so seriously damaged as her consort, and able to steam at any speed up to about twenty knots, was making tolerably good weather of it.

Not so the wounded *Mariner*. Her speed had gradually dropped from ten knots to nine, and from nine to a leisurely crawl of barely more than seven, for, though the pumps and ejectors were still keeping the water under, Wooten did not feel justified in taking unnecessary risks by forcing her head into the sea. Even as it was, her upper deck was dangerously close to the crests of the foaming whitecaps as they swished past. Some of them were actually breaking on board.

The *Minx* was senior officer, and knowing that her people would be chafing at the delay, Wooten had signalled to her during the afternoon. 'Won't you go on and get in before dark?' his semaphore spelt out.

'How about you?' came back the answer.

'Water is being kept under,' said Wooten. 'No anxiety. Can steam at slow speed, but if sea increases shall have to reduce.'

'Shall remain in company with you until you are in safety,' was the answer. 'Would you like to be towed?'

'Not so bad as all that, thank you,' said the *Mariner*.

Darkness came, thick and impalpable, and still they struggled on. The night seemed interminable. Nobody slept, and all through the long hours men went round tightening plugs and readjusting the wedges of the shores which tended to loosen themselves with the heavy labouring of the ship. She rolled, pitched, and wallowed, while all the time the men in the engine-room nursed their hardly-tried machinery. All through the night Wooten never left the bridge, but always he could see the dull stern-light of the *Minx* rising and falling on the seas a short distance ahead. He blessed it. It seemed like a star guiding him to safety.

At two o'clock the next morning the sea began to abate as they felt the lee of the land, and when the dawn came they saw the long line of the coast stretching across the horizon before them. The sight of it brought gladness to their weary souls and revived their jaded hearts.

They were unaware of their exact position until they drew near enough to recognise landmarks, and it was not until ten o'clock that the two battered ships crawled slowly up the sluggish river of a certain port on the east coast.

An hour later they had secured alongside a jetty and the wounded were being disembarked. Some were past caring; but the others smoked their cigarettes, waved their caps, and shouted to their shipmates as they were lifted tenderly ashore and placed in the motor-ambulances waiting to take them to hospital.

'Are we down-hearted?' yelled a voice.

'No!' came back the roaring reply.

'So long, Nutty! So long, Pincher! So long, Ginger! Come back soon!'

'Come back?' laughed the irrepressible Ginger, putting his fingers to his nose as he stepped on to the footboard of his vehicle. 'Come back? Not in these 'ere trousers! I'm off on a drop o' leaf in me motor-car! Na then,' he went on, striking an attitude. 'Stand back, there! Stand back, you boys!—Mind the step, lady! Thank you kindly, miss,' making a low bow and doffing his cap; 'that'll be ninepence change.—Walk up, genn'elmen! Any more for th' Marble Harch, Hearl's Court, Piccadilly Circus, and Colney 'Atch? All the way for a tanner! Walk up! Walk——' 'Ere, guv'nor,' as the driver moved a lever and the ambulance shot forward with a jolt which nearly flung him into the road. 'Old 'ard a minit, carn't yer!'

'S'long, Ginger boy!' howled his shipmates.

'S'long, boys!' he bawled, waving his cap. 'S'long!'

Wooten waved his hand. The motor 'honked' furiously, and vanished in a cloud of dust and a volley of cheers.

It was all over. The *Mariner* had won through—but at a price.

#### CHAPTER V.

Mrs Martin laid down the newspaper with a sigh and gazed fondly at the photograph of her sailor son.

She was not naturally emotional, but for hours her mind had been racked and tortured by doubt and anxiety. She could not bring herself to think. Her brain seemed incapable of sustained effort, though sometimes, chiding herself for a silly woman, she tried her hardest to convince herself that Bill—her Bill—was safe. There was nothing really to worry about. She was not even certain that the *Mariner* had taken part in the fight. But the optimistic feeling never lasted for very long, and deep down in her heart there was always that dull, gnawing feeling of despair and a dismal foreboding of evil. She felt, somehow, in her bones that her son had been in action, and nothing could make her think otherwise.

Her husband, stolid and phlegmatic though he usually was, did his utmost to comfort her, but without much success. His wife saw through his little wiles and artifices, and even an outsider would have noticed that he, too, was depressed and gloomy. So his clumsy, well-meant efforts had little effect.

It was so difficult to form any real opinion, or to know what to believe.

The British fleet had won a great victory—that everybody soon realised; but its losses had admittedly been heavy, and in the first bald, official account of the engagement vouchsafed to the public through the medium of the newspapers, five destroyers, among other vessels, were mentioned by name as having been sunk. Another six, unnamed, were 'still unaccounted for,' and suppose the *Mariner* were one of them!

Then came another later *communiqué* announcing that the total loss in destroyers amounted to eight vessels in all, though the lessening of the chances of the *Mariner's* being one of them brought little or no relief to the anxious mother and father in the little country cottage.

But they put a brave face on it, and perked up visibly on the morning of June 4 when they read in the Sunday paper the names of the three craft hitherto unmentioned. The *Mariner* was not one of them.

Then, soon after noon, came a bomb-shell in the shape of a telegram from the Secretary of the Admiralty. 'Regret inform you William Martin—ordinary seaman—severely wounded—progressing favourably,' it said in terse official phraseology.

Nothing more. Not another word.

How were they to know that wounds received in action were officially classed under three different headings—'dangerous,' 'severe,' and

'slight'? How could they be aware, if their son had been in the slightest danger of his life, that they, as his next-of-kin, would have been summoned to the hospital with the least possible delay?

They knew nothing of these things. Their Bill was severely wounded, the official telegram said, and that was quite enough to knock the bottom out of their little world. Mrs Martin, for the first time in her life, fainted.

But the same evening, when the post-office roused itself from its Sunday afternoon apathy, there came another telegram, and this time from a soft-hearted sister of Queen Alexandra's Royal Naval Nursing Service serving at a naval hospital on the east coast: 'Operation on your son most successful—no danger—patient very cheerful—getting on excellently—asks to see you—come if possible—book to —,' followed by the name of the place.

The sister had apparently forgotten that the price of telegrams had risen to ninepence for twelve words, but she little knew what joy her message brought to the hearts of two people.

Mrs Martin dried her eyes and smiled again. Her husband went off to ask a day's holiday on the morrow, and to borrow a Bradshaw from the vicar. He was away a very long time. He was telling every one he met of the wonderful news.

'Our Bill' had been wounded in the great battle. Mr Martin felt very proud.

#### CHAPTER VI.

And so it came to pass that at two o'clock the next afternoon Mr and Mrs Martin, hot, dusty, and rather dishevelled, found themselves disembarking from a train at a distant railway station. They were both unused to travelling, and the cross-country journey had been very trying, for, leaving home at six o'clock after a hurried breakfast, they had had to change no less than three times. True, the vicar had insisted on lending them his dogcart and groom-gardener to drive them to Caxton station; but even the magnificence of their arrival—witnessed only by the booking-clerk and one sleepy-eyed porter, but the news of which would presently reach Mrs Ruff, and, through her, half the population of the village—could not altogether atone for the discomforts of the journey.

The day was unusually hot. The carriages were crowded and stuffy, and Reuben, attired in his Sunday garments and wearing a brand-new, highly genteel, stiff collar, was inclined to be fractious at things in general, and at missing his substantial midday dinner in particular. A glass of inferior ale and two doubtful sausage-rolls, purchased at a railway buffet from a supercilious, frizzy-haired, tightly attired young woman with a brazen stare, was not sufficient to sustain any British working-man with a

healthy appetite. Mrs Martin had lunched simply off a cup of tea and several slices of home-made cake produced from the depths of her capacious string bag. Her husband rather envied her, for home-made cake, whatever its faults, was certainly filling at the price.

The languid fairy behind the bar, moreover, though she wore the badge of the Army Service Corps pinned to her bosom, took little interest in the war, and none whatsoever in the welfare of Mr William Martin, ordinary seaman in His Majesty's Navy. Indeed, when Reuben told her his news, she merely lifted her eyebrows, yawned, and remarked, 'Reely naow; haow interestin'!' punctuating the sapient observation with a peremptory demand for one and fourpence.

Sixteenpence for a glass of watery beer, a cup of weak tea, and a couple of sausage-rolls all wind and stale pastry! Preposterous!

But Reuben dared not object. The haughty damsel affected the airs of a duchess at a charity bazaar. Perhaps she was a duchess, he reflected; one never knew what the women were up to nowadays.

Also, the Martins were rather oppressed by their clothes, for both husband and wife wore their Sunday best. Reuben was in a suit of shiny black cloth, a bowler hat, and a pair of boots rather too small for him. His large, calloused hands were encased in yellow kid gloves, while his high collar, so tight that he could hardly breathe, was in a state of pulp before the journey was half over. Indeed, its owner spent most of the time gasping like a fish out of water and in removing his head-gear to mop a shiny forehead with a red cotton handkerchief.

Plump little Mrs Martin wore a black dress originally purchased for her sister Jane's funeral, but which, with sundry alterations and additions, had since been called into use for wear on Sundays, and at dairy shows, jumble sales, and other village dissipations. She had black cotton gloves, a short cloak of black satin trimmed with sequins and jet beads, with a bonnet of the same sombre hue, adorned with a nodding feather and a bow of crimson velvet. The bonnet, embellished with bows of different colours for the sake of variety, likewise did duty on all solemn and festive occasions.

Mrs Martin's face was moist and crimson, and she clutched the bulging string bag, which, besides her lunch and a copy of the *Family Herald*, contained a pork-pie, two pots of home-made black-currant jam, and fifty cigarettes. They were presents for her wounded son; and how was she to know that pork-pies, at any rate, did not as a rule figure in the diet sheets of hospitals? Her Bill was fond of them, and that was all she thought about.

The tiresome journey came to an end at last, and leaving the station, the couple embarked upon a lengthy wrangle with an elderly and disreputable-looking Jehu perched on the box

of a mid-Victorian 'growler.' He, observing that 'times was 'ard' and that they were strangers, eventually condescended to drive them to the hospital for the sum of half-a-crown. It was good of him, for the distance, as the crow flew, was little more than half a mile, though one and three quarters by the circuitous route by which he took them. Ignorance is bliss, and the Martins did not discover the real distance until afterwards.

But they got to the hospital at last, and, after being questioned by an inquisitive hall-porter as to their business, were conducted through interminable corridors and handed over to Sister Smith, the nurse in charge of the ward in which Martin was a patient.

'Oh,' she said, 'I'm so glad you've come. Your son will be so pleased to see you.'

'And how is he, miss?' asked the anxious mother.

'Getting on splendidly,' said the nurse. 'He's one of our best patients, and so cheerful.'

'That's good news, miss,' said Reuben. 'An' how was he wounded?'

'Three shell wounds in the back,' said the nurse. 'Poor boy! I'm afraid he was in some pain when he came; but he was so brave, and since the operation he's picked up wonderfully. He'll be fit to travel to Haslar Hospital in a fortnight, and when he's quite well again he'll be sent on sick leave. But I expect you're in a hurry to see him,' she added, smiling. 'If you will excuse me a moment, I'll tell him you're here.'

'Thank you, miss.'

The nurse hurried off, to reappear again in a few moments. 'Will you come this way, please?' she said. 'Oh, but excuse me,' she went on, eyeing Mrs Martin's bag. 'Is that something for your son?'

'Yes, miss,' said Mrs Martin cheerfully. 'I've brought him one o' those pork-pies he's so fond of, and two pots o' jam. Likewise a few cigarettes.'

Sister Smith looked solemn. 'I'm afraid he

can't have the pork-pie or the jam,' she observed. 'You see, he's on a special diet at present. He will be pleased with the cigarettes, though.'

'An' me bringin' them all this way!' Mrs Martin protested.

'What a pity!' said the nurse consolingly. 'However, if you like to leave the jam with me, he shall have it when he gets better. The pork-pie won't keep, will it? But I dare say I can find some use for it with one of the other patients if you like to leave it.'

Mrs Martin, very reluctantly, was forced to disgorge everything except the cigarettes and the *Family Herald*, and two minutes later father and mother were standing at their son's bedside in the large, airy ward.

'Ullo, ma! 'Ullo, father! 'Ow goes it?' demanded the patient, with a cheerful grin. 'Fine ole time I've bin 'avin'! Fancy me bein' wounded an' landed in 'orspital!'

The mother, her eyes brimming with tears of thankfulness, bent down and kissed the white face on the pillow—kissed it again and again. 'Oh Bill!' she murmured. 'Thank God you've come back safe!'

Her son, unable to rise, patted her affectionately on the shoulder. 'That's orl right, ma,' he said. 'Don't take on so! It isn't nothin' to go gettin' worried over.'

'Can't help it, Bill dear,' she whispered huskily, while her husband, hat in hand, stood by with a sheepish grin and a lump in his throat.

'You 'aven't said, "'Ow-de-do?" father,' said Bill, wringing his hand. 'Ow's the village gettin' on? 'Ow's everythin' at 'ome, an' li'l Halbert?'

'Fine, son,' his father answered.

'Gosh!' ejaculated the patient, fumbling under his pillow and holding out three slivers of ragged steel. 'That's wot they took out o' me back. Pretty things, isn't they? Lor' lumme, though,' he added, 'we didn't 'arf give them blokes an 'ammerin'!'

THE END.

## A RED INDIAN CAMP IN THE OLD DAYS.

By DAVID MACRITCHIE.

IT is wonderful how a chance word, spoken or read, may waken into life a long train of slumbering memories. At this moment I am realising the truth of this familiar observation. Picking up a little book of travel and adventure published by Blackwood in 1851, under the title of *Life in the Far West*, I happened to read the following passage: 'Passing the Wa-ka-rasha, a well-timbered stream, they met a band of Osages going "to buffalo." These Indians, in common with some tribes of the Pawnees, shave the head, with the exception of a ridge from the forehead

to the centre of the scalp, which is "roached" or hogged like the mane of a mule, and stands erect, plastered with unguents, and ornamented with feathers of the hawk and turkey. The naked scalp is often painted in mosaic with black and red, the face with shining vermilion.' These words at once recalled an old experience of my own, to be described shortly, in connection with the same tribe.

The period of the encounter mentioned in the above passage was somewhere about the year 1830. The Osages, or, more correctly, the

Wasajie—for the dissyllabic 'O-sage' seems to be an erroneous pronunciation of an earlier French 'O-sa-gé' (the stress being laid on the first syllable)—belong to the great family of the Sioux Indians, and they formerly ranged over the territory stretching between the Lower Missouri and the Lower Arkansas. Their home, indeed, was that 'wonderful land, at the base of the Ozark Mountains,' into which Longfellow's Evangeline vainly followed her lover.

Spreading between these streams are the wondrous, beautiful prairies,  
 Billowy bays of grass ever rolling in shadow and sunshine,  
 Bright with luxuriant clusters of roses and purple amorphas.  
 Over them wander the buffalo herds, and the elk and the roeluck;  
 Over them wander the wolves, and herds of riderless horses;  
 Fires that blast and blight, and winds that are weary with travel;  
 Over them wander the scattered tribes of Ishmael's children.

Here and there rise smokes from the camps of these savage marauders;  
 Here and there rise groves from the margins of swift-running rivers;

And over all is the sky, the clear and crystalline heaven,  
 Like the protecting hand of God inverted above them.

Such was the land of the Wasajis when they were first seen by white men. But their territory became gradually more and more circumscribed, until in 1871 the Government of the United States removed them to a reservation in the north-eastern corner of Oklahoma. Mr George A. Dorsey, a well-known American anthropologist, who visited them in 1901-1903, partly for the purpose of collecting their folk-tales, gives a melancholy account of them. 'They are degenerating rapidly,' he says, 'are very lazy, and much addicted to drink; the use of the peyote or mescal [a bitter but intoxicating liquor brewed from small red berries] among them is rapidly increasing.' Indeed, owing to this habit, the old men of the tribe were seldom in a fit condition to furnish Mr Dorsey with the tales and traditions which he sought to obtain from them.

They were a very different and a higher people when they were encountered on one occasion by the present writer, who was then a member of an 'outfit' of bison-hunters on the plains of south-western Kansas. At that time the bison still roamed in hundreds of thousands over the western prairies, although the trans-continental railway had divided 'the main herd' into 'the north herd' and 'the south herd.' It was, of course, the south herd that we were following when we came upon the Wasajis. They had no legal right to be there at all,

beyond the northern limit of the Indian Territory, otherwise Oklahoma, or, in frontier parlance, 'The Nation,' but they cared little for the white man's law, and these western plains were still unsettled, inhabited only by wild animals, Indians, and occasional wandering whites.

Our little train of wagons was rattling merrily over the prairie one bright February morning, when we caught sight of a tall, brown figure, with his gun over his shoulder, striding along in our direction, but bearing off at a tangent to our line of march. I had already seen tame Indians, but this was my first wild specimen, and he was good enough to satisfy a youthful imagination nursed on the romances of Fenimore Cooper and his school. As he came abreast of us, though at some distance out, he turned his head and looked at us for a moment, taking in our appearance and numbers. 'Some more of those accursed whites, come to rob us of our game,' was no doubt his inward thought. But he held on his way without bestowing any further attention on us, and soon an undulation of the prairie hid him from our view. A few minutes later we were confronted by an old Indian, who emerged from the brushwood on our left; for we were nearing a watercourse, fringed with a growth of cotton-woods and other trees. He was wrapped in his blanket, and stood regarding us gloomily, a full-blooded Indian, with strongly marked features of a distinctly Mongoloid character. There was nothing of the poetic Indian about him, for the only English word he seemed to know was 'mooney,' which he grunted at us several times in a questioning way. No money being forthcoming, he had to content himself with a little tobacco. By this time two or three other Indians had appeared upon the scene. Ascertaining from one of these who could speak English that their camp was only a few hundred yards distant, and that a visit from us would not be resented, although it was not invited, several of us, leaving our weapons in the wagons, under the charge of our comrades, followed our new acquaintances through the 'brush' until we came to the open ground where their camp was situated.

The number of their lodges, or *teepees*, which were not conical, but rounded or oval, very much like the tents of English gypsies, indicated a large band, and this inference was strengthened by the sight of a herd of one hundred and fifty or two hundred small horses, or 'Indian ponies,' grazing near at hand. Not many men were visible, some being away hunting, while others kept themselves retired within their wigwams. But the squaws were busy with their daily duties, numerous children were running about at play, and several men and youths condescended to converse with their white visitors. We shook hands with each other, exchanging the Indian salutation 'How!' (probably a corruption of 'How do you do?'), and having a certain

amount of friendly intercourse. We learned that they formed a subdivision of the band ruled over by 'Sunset,' at that time a well-known chief of acknowledged ability. He was not with them on this occasion, and his lieutenant, too proud to hold converse with a few casual hunters, was at that moment sitting in his lodge, engaged in playing cards with some of his braves. Had we been representatives of the White Father at Washington, prepared to listen to or to offer some proposal to their advantage, our reception would have been much more cordial.

Among other little scraps of information, we learned that it was their intention to make a raid upon the settlements when the grass was 'that high'—a design which, for some reason or another, they did not carry out until the following year. We could see that they were well equipped for such an adventure, as they possessed beautiful rifles of the latest pattern. Some youths, clad only in breech-cloth and leggings, who were lounging about, were almost as formidable opponents in a more primitive way, for they showed a devilish facility in launching an iron-pointed arrow, dartwise, at a slender sapling some fifteen or twenty feet off, where it stuck, quivering in such a manner as to make at least one of the spectators inwardly resolve to keep a steady watch upon their movements.

The squaws were, of course, the only busy people in the camp. Some were returning from the groves that bordered the neighbouring stream, bearing great back-burdens of brushwood for their fires. Others were actively employed in dressing 'green' buffalo-hides. These were stretched horizontally, with the pelt undermost, upon upright stakes about waist-high, and the women, having spread upon the raw skin a moist preparation in which deer's brains formed an important ingredient (as we were led to understand), were engaged in rubbing in this composition by means of long-handled wooden scrapers, resembling the rake of a croupier at a gaming-table, which they pushed steadily to and fro. By this method any tendency to putrefaction was arrested, and the skin cleansed and rendered soft and pliant. As we paused for a minute to watch this process, the squaws found time to bestow several glances, not unkindly, on their alien visitors, joking with each other in their own tongue after the frivolous way of women.

It is not quite correct to say that the men in camp were all absolutely idle, for we came upon a scene of a most interesting description, in which an Indian barber was at work. This scene, indeed, illustrated the striking fashion referred to by the early writer whose words are quoted in the opening paragraph of this paper. Seated on the ground was a very dignified personage, upon whose *chevelure* the hairdresser was operating with a pair of scissors. The chief's scalp was shaved on both sides almost

up to the crown, leaving a ridge or crest of stiff, brush-like hair, 'hogged like the mane of a mule, and standing erect.' Seen in profile, this produced an effect exactly like that of the artificial brush surmounting the helmet of a Roman knight, or of his modern representative the French cuirassier. Indeed, since there is a reason for every fashion, it is not at all unlikely that the horse-hair ridge on the Roman helmet derived its origin from a natural growth treated in the same way as among these Red Indians of the nineteenth century. The shaven scalp of this chief—for he was clearly a man of consequence—was powdered with a bright vermilion dust, and his cheeks were similarly ornamented. It was evident that he resented our presence, although our observation of him was discreet and brief, for he paid as little attention to us as possible. And it must be admitted that no gentleman in the hands of his *coiffeur* would welcome the intrusion of spectators, even if these were his personal friends. On the other hand, the attitude of the hairdresser was extremely amicable. In view of his occupation, it seems very appropriate that he had a dash of French blood in his veins, and, by inheritance, knew a little of the French language. At the present day one is apt to associate the French Indian with Canada alone, but in former times the whole of the vast territory from the Great Lakes to the Gulf of Mexico was a French 'sphere of influence.' Survivals of this era are found even yet in the place-names and tribal-names of that region, in the familiar word 'prairie' itself, and in the speech of certain castes in New Orleans, black as well as white, whose mother-tongue is French. In his very manner this Wasaji barber displayed a good deal of French suavity, and the way in which, as a token of friendliness, he playfully snipped a few hairs from the beard of one of my comrades was French rather than Indian. There could be no doubt that he was pleased to see us, whether this was due to his strain of European blood or to his own natural amiability. The fashion of dressing the hair just described was not exemplified by any of the other Indians whom we saw. If, as is probable, it was restricted to men of condition, other examples would have been found in the chief's tent, but this we were not allowed to enter.

We did gain admission, however, into another tent, where, among various domestic utensils, we observed one of the hand coffee-mills so common in the United States, and also common in Britain during the early nineteenth century. It will be seen that, although these Wasajis were what is called 'blanket Indians'—that is to say, Indians living in the ancestral fashion and despising the 'store clothes' of the whites—they availed themselves of such useful articles as coffee-mills, scissors, and breech-loading rifles, not to speak of playing-cards. But they drew

a sharp distinction at articles of apparel. It was in this very tent that a youthful member of our party, disencumbering himself of a brightly coloured football belt that it was his fancy to wear, submitted it to one of our guides with the suggestion that it might be bartered for a pair of moccasins or some such gear. The Indian examined the belt without any emotion, and then handed it back to the owner with the cold observation, 'We don't wear them things.' After all, why should he have had the least desire to become the possessor of this alien girdle? Nomads are not collectors of curios, and in all races people prefer to dress like their kindred and not like foreigners.

As the short sentence just quoted indicates, those Indians who were acquainted with English employed the ungrammatical speech of the ordinary frontier whites. This, of course, was quite natural, as these were the white people with whom they were most in contact.

Our visit was not of long duration, for we had to remember the comrades who, not without some anxiety, were awaiting our return. So, bidding farewell to our hosts, we withdrew from the camp, accompanied by a following of boys and girls. Attracted partly by the novelty of our appearance, these youngsters had attached themselves to us at an early stage of the proceedings. They seemed quite devoid of any inherited aversion to the 'palefaces,' and indeed made more than one half-shy, half-bold advance. As we left the camp behind us, we might have been so many Pied Pipers, with these children skipping joyously about us, oblivious of all claims of family and race. Even after we had regained our wagons, which were at once set in motion, some of these youthful Indians still ran after us, only just evading our attempts to carry them off. Without being aware of it, they had, by their natural and spontaneous action, erased all racial distinctions, and we felt that we were parting from friends when their figures gradually diminished in the distance.

The impression given to us by this Indian camp was that of a well-organised, healthy, happy community, living its own life, after the ancestral fashion, without interference from others.

The present condition of these people is that of steadily increasing degradation. It is futile to seek for some one to blame for this result. White men and red men are alike the victims of an inexorable destiny. The Indians have been deprived of their hunting-grounds, which matters little now, since there is no longer any game to hunt. Thus their hereditary methods of obtaining food, clothing, occupation, and amusement have all been rendered nugatory. Equivalents, or what are meant to be equivalents, are given to them. They are now the pensioners of the whites, and have the means of subsistence. Moreover, the most admirable arrangements are

made for their education, according to white ideas. They—that is, the Red Indians generally—have every opportunity for acquiring training as farmers, artisans, tradesmen, or professional men. There are many Indians at the present day of the best education, ladies and gentlemen in every sense. But these have taken on an alien civilisation, and have forsaken the ways of their forefathers. The real representatives of the old life, so far as it can still be represented, are those unhappy people who seek to forget their misery in intoxicants, and sit all day brooding over the irrevocable past. The camp by the prairie stream, as I saw it many years ago, typifies a condition of things that has passed away for ever.

#### HIS MAJESTY'S MINE-SWEEPERS.

WHEN this cruel war is over and the full history told,  
What a tale of deeds upon the sea that story will unfold,  
Of men who faced a sudden death in many an awful form,  
When they boldly braved for Britain's sake the battle and the storm!

We are thankful for our battleships that proudly ride the wave,  
And well we know the men aboard are the bravest of the brave,  
That our cruisers and destroyers with ever-ready guns  
Are always keeping watch and ward against the prowling Huns.

But do we all remember the glorious work of these  
His Majesty's mine-sweepers who go clearing of the seas  
Of dark and grim and deadly shapes that have hurled to the deep  
Many hundred gallant fighting men now sleeping their last sleep?

The fisher-lads of Britain have left trawling nets and lines  
To handle the steel hawser and go groping for the mines.  
The hardy men from merchant ships have donned the Navy blue,  
And are helping with stout hearts and hands to pull the country through.

They may not meet an enemy exchanging blow for blow,  
But one that lurks beneath their keels wherever they may go.  
There comes no stir of battle their spirits to inflame,  
Yet day by day a deadly risk is with them all the same.

So may God bless these gallant men who keep our tideways free,  
And never flinch from duty in all perils of the sea,  
Who, be they fishers, merchant jacks, or Royal Naval tars,  
Are saviours of our Empire in the greatest of all wars.

R. O'D. ROSS-LEWIN.

## SEVENTH SERIES

'No. 13.'

By C. A. NASH.

PART I.

I WAS in the City two years since for the first time for nearly fifty years. My visit was to old St Helens, and its particular object a very ancient house, situated in a rather dark court off that busy thoroughfare. I have often thought that the London merchants of a couple of centuries ago who chose those quiet old nooks for their offices and warehouses showed much sense. Nothing could be more marked than the contrast between the roar of the great thoroughfares and the almost monastic quiet of these retiring courts and yards.

The old house which was the object of my visit was No. 3 Dove Court, and my visit was valedictory. The house had been, up to six months before, my own property; but a large area, in which it was included, had been bought over by the London County Council, and the old houses—most of them, indeed, in an advanced stage of senile decay—were to be demolished to make way for the modern many-flatted palaces in which business is carried on in the London of to-day.

I suppose, when a man reaches his seventieth year, he is, to some extent at least, a *laudator temporis acti*. I by no means fail to acknowledge the many and vast improvements that have taken place since I first knew Dove Court; nor do I undervalue the important aids afforded by the telephone and cheap telegraph rates—they were very expensive in my time; but I cannot help thinking that there was more dignity in City life in my early days. We did not rush about with our hats on the back of our heads, or, indeed, hatless altogether, as I see hundreds of the younger generation of to-day. But I suppose I had better tell my story, and let the young men wear their hats as they like, or dispense with them altogether should they prefer to do so.

Our firm was known as Wigers & Cripplebury, Spanish and Portuguese Produce Importers, Dove Court, Great St Helens, E.C. It was a great many years since either a Wigers or a Cripplebury had had anything to say regarding the direction of affairs in the dingy old house in Dove Court. The original Stanley Wigers was permanently deposited, in the year 1759, in the

graveyard attached to St Olave's Church, Hart Street, Crutched Friars; while a monument in St Giles's, Cripplegate, informed any interested tourist that Ephraim Cripplebury had (appropriately enough) in the year 1771 exchanged the comparative quiet of Dove Court for the absolute tranquillity afforded by a vault in that ancient fane.

Many names had figured since then as partners in the old business, and at the time of which I write my father, George Dutton, was its sole owner. This was in 1865, fifty-two years ago.

Our business was extensive, and the house had long enjoyed the reputation of keeping only the best kinds of the various articles it imported. The time had not yet come when quality had to be sacrificed for cheapness. If the big West End caterers wanted the best hams of Montanez, the finest turrón from Jijona, the real olive-oil that had the flavour and perfume of the olive, the red chorizos and pimentesco from Estremadura, the fat Castilian garbanzos, as a matter of course they looked for their needs to Wigers and Cripplebury. So it was in the matter of wine. We kept no cheap rubbish, but our vaults in the London Docks could supply the rarest old ports, as well as the choicest specimens of Spain's output; and the London wine-merchant showing a country customer the commercial sights of London highly appreciated a 'tasting order' from Dove Court, which enabled him to initiate his friend into the mysteries of the soleras and amontillados and generous olorosos which were destined to generate eloquence at many a civic banquet.

My father was to a very great extent opposed to changes, and this was apparent in the building in which our business was carried on. The front-door opened into a large flagged hall, out of which a stone staircase led to the upper part. The balustrade was of old oak of enormous solidity. The four rooms on the first floor had long been used as store-rooms, but the beautiful Italian mantelpieces still remained, grimed with the soot and dust of some two hundred years; while one of the upper rooms actually contained a venerable and worm-eaten canopied wooden four-poster, in which very likely some ancient

Widgers or Cripplebury may have slept or lain awake, forecasting the possibilities of the next vintage in Oporto, or the olive crop in Andalusia.

The offices proper were two, and on the ground-floor: the outer, or public, office, in which the clerks sat, with its one window looking into the court; and the private office, opening out of this. The private office was quite a small room, and contained in the way of furniture only my father's desk and two glass-fronted cases, in which samples were kept, and three or four chairs. On the centre of the ancient marble mantelpiece rested a very grimy old Spanish model of two oxen drawing a butt of sherry and guided by two men in broad-brimmed sombreros, whom I supposed in my very early days to represent the original founders of the house. The memory of these latter worthies was, however, indubitably perpetuated by two works of art hanging one on each side of their supposititious presentments. On the right hand, facing the fireplace, was a very beautiful miniature of a bewigged, little, old gentleman in a blue coat with an enormous collar which ascended half-way up the back of his head, a white and very voluminous neck-cloth, and a frilled shirt. A faded writing on the back stated that 'this miniature of Stanley Widgers, Esq., æt. 76, was painted by Richard Cosway in the year 1752.' On the left hand hung a silhouette of the bust of a gentleman with a rather prominent front, wearing his own hair, which was interspersed with golden strands. This, too, on the back bore an inscription: 'Ephraim Cripplebury, 1767.' The tomb in St Giles's gives his age as eighty-six at the time of his death in 1771, so it was rather difficult to account for the golden locks in his eighty-second year. Perhaps the old gentleman was averse from sporting jewellery, and the artist may have fallen back on this plan of illustrating the adage, 'Win gold and wear it.'

Up to my seventeenth year I had been at a school in the City. We were very well taught such subjects as were embraced in the curriculum of the establishment. As most of the pupils were the sons of London merchants, and were intended for a commercial life, these subjects were chiefly arithmetic, English composition, and modern languages. The last-named were all taught by native masters. So we had, for Italian, Signor Grassi, a very stout Neapolitan; for French, Monsieur de Surmont; and the Spanish class was in the charge of Don Enrique Ramirez, who was my great friend. This came about for two reasons. In the first place, it was most important that I should acquire a good knowledge of Spanish, which would be necessary from a business point of view; and, secondly, it was through my father's influence that Don Enrique was appointed to the post, which was a good one. As I said before, the pupils were nearly all sons of City merchants. The school fees were high, and the board of governors, of whom

my father was one, took care that the masters should all be the best obtainable in their different capacities. Hence they paid good prices, and got good stuff—a sound commercial principle.

On leaving school I was given a desk in Dove Court. For the first year my time was taken up copying letters and preparing samples, with a weekly visit to the bonded stores at the Docks. After that my father took me into his own office, where I learned more about the real working of the business; and a couple of days in the week were devoted to calling on our customers, who, my father said, always appreciated personal attention. I must say I liked the work, and the summit of my ambition was reached when, in my third year, my father spoke of sending me on a trip to Spain, to make the acquaintance of our correspondents there, and learn something of our business at headquarters, as he put it. My father had, in his early years, paid several visits to Spain; but as, for a long time past, he had no partners in the business, his presence had been continually required at home.

'In any case, Fred,' he said to me, 'you have a great advantage over me. You speak the language well, whereas the little Spanish I ever knew has now grown very rusty.'

I had worked hard at my Spanish, not only at school, but since, and I always had my lunch at the 'Granville' in Little Tower Street, which was a great resort of the Spanish colony in the City, and where I had a daily opportunity of adding to my previously acquired knowledge. Besides, Don Enrique Ramirez was a constant visitor at our house at Highgate. He was a native of San Lucar de Barrameda, and had studied with brilliant success at the university of Seville. His father had been manager of an oil-mill at San Bartolomé, and there my father had made his acquaintance, as a little boy. He had ever since taken a great interest in his career, and so, when a vacancy occurred in the Merchant Vintners' School, he recommended his appointment. He thus achieved a double object; he benefited his friend, and secured a first-rate man for the post.

Besides the desire of my father that I should make the personal acquaintance of our friends in Spain, there was a particular reason why he thought my visit necessary. Of late years our trade in olive-oil had developed very sensibly. We had always had a very good output for the finest kinds, but in the past few years we had gone in for lubricating oils, and had secured several excellent contracts for supplying some of the chief shipping firms and railway companies. In this latter branch we had given complete satisfaction; but of late we had had some, I can hardly call them complaints, but hints from more than one of our West End customers that they thought the finer kinds of oil were not quite up to the old standard. And, indeed, we thought so ourselves. Seville had always been

our source of supply. Our house had for many years dealt exclusively, or nearly so, with a Señor Toreno, who had died some two years before the time of which I write, and who had been succeeded in the business by his son. And it seemed to us that the latter, Don Andrés, did not show the business capability of the late Don Francisco, his father.

After many minute instructions from my father, and armed with several letters of introduction, I sailed from London on the *Rita*, a Spanish steamer which did most of our carrying trade. Her captain, Don Pedro Santana, was an old friend of mine, and he made me very comfortable. He was bound, in the first place, for Cadiz, whence he was to go on to Malaga, and having discharged his heavy cargo, return and proceed up the Guadalquivir to Seville, that river being then navigable only for vessels of light draught.

So, having disembarked at Cadiz, I went on to Jerez, where I spent a very pleasant fortnight, being hospitably entertained by several of my father's old friends. At the end of that time I took the *diligence* for San Lucar, and went up the Guadalquivir by one of the river-steamers, reaching Seville on the 5th of June.

I had been already delighted with what I had seen of Spain at Cadiz and Jerez, but this day of seven or eight hours on the river completed my fascination. Several of my fellow-passengers warned me against remaining on deck, exposed to the torrid heat of the sunshine, and they were much amused when I told them it was the first time I really understood the meaning of the word. They were delightfully simple people, and I fear I confirmed their preconceived ideas of foggy England.

On arriving in Seville I went to the hotel, and spent a few hours of the next morning sight-seeing. In the afternoon I paid my visit to Don Andrés Toreno. He had been advised of my coming, and received me with much urbanity. He did not speak of business, as he took me at once from his office to his private house, where I was introduced to his family, which consisted of his wife, Doña Maria, and his two daughters, Mercedes and Candidad. They were both very charming girls, and quite free from the stiffness which I had been told was a characteristic of Spanish young ladies. Mercedes resembled her father, who was very dark. Her eyes were very beautiful and lustrous, and altogether she struck me as the handsomest girl I had ever seen. Candidad was of quite a different type. She was almost fair in complexion, with brown hair and violet eyes. I could see she reproduced the Valencian features of her mother, who, in her youth, must have been very beautiful.

Don Andrés insisted that I should be his guest during my stay in Seville, and would take no denial. Indeed, I think my hesitation in

accepting his kindly proffered hospitality was short-lived. And, after all, a sojourn with his family would be much more pleasant than a lonely existence at the hotel, which, to tell the truth, was not very inviting.

The house of Don Andrés was an old Moorish building, as so many of the houses in Seville are. The entrance-porch led to an open-work iron gate. The interior was built with an open square courtyard, or *patio*, on each side of which were corridors supported by a great number of tiny marble pillars. A small fountain played in the middle of the court, which was covered over during the summer with a canvas awning. This, indeed, was the living-room at the time of my arrival, as during the hot weather the cool ground-floor was exclusively occupied, whereas in the winter the family migrated to the upper one. There was not a carpet to be seen anywhere. Only here and there a few mats partly covered the floors, which were all inlaid with beautiful old Moorish tiles, or *azulejos*, mostly sapphire and blue in colour. My first impression was that Don Andrés must be a man of enormous wealth and importance to occupy such a mansion, and I was much surprised to learn that many such houses were to be had in Seville at the rent of eighty or a hundred pounds a year, English money. The house of Don Andrés was, however, his own property, and had been in the possession of his family for over a hundred years.

On the evening of my arrival we dined in the *patio*. In addition to the family there were four or five guests, and my first experience of a Spanish dinner *en famille* was delightful. They seemed to vie with each other in politeness to the stranger, and I was very soon completely at my ease among them. Shortly after dinner, about nine o'clock, we all went out to the *alameda*, a beautiful public walk, bordered on each side with orange-groves. Here we sat for an hour, enjoying the music of an excellent band, and then adjourned to one of the many cafés, where we drank iced *horchata*, a delicious drink composed of barley-water and pounded almonds. Towards midnight we returned home, and after a final chat in the *patio* retired to our rooms. This was the nightly programme. It certainly seemed to me a very enjoyable kind of life.

However, I had not come to Seville solely for amusement, and on the third day of my visit, when in the office of Don Andrés, I mentioned the matter of the recent complaints which we had had in the matter of the oil. He seemed somewhat disturbed, and assured me that there was in reality no foundation for the fault-finding, and that the oil shipped by him was of exactly the same quality as that formerly sent by his father, but that in future he would exert the greatest care, and take our business under his own exclusive supervision. I did not

see that I could do anything further in the matter.

Among the letters of introduction which I had brought with me was one from Don Enrique Ramirez to a Señor Paderna, who was proprietor of the largest olive-farm at San Bartolomé, some couple of miles distant from Seville. When I spoke to Don Andrés of my intention of visiting this gentleman, I thought he did not seem over-pleased. I asked him if he was well acquainted with him. He answered, 'Oh yes; naturally in the course of business I know all the growers around Seville, him included.' Still, there seemed to be something kept back. He did not say anything in favour of Señor Paderna; neither did he convey anything that would be likely to prejudice me against him. This I must freely admit in the light of what followed.

I found Señor Paderna very friendly, and expecting my visit. He had had a letter from Don Enrique announcing my impending call, and he received me with much kindness. He took me round his farm, which just then looked well, as the trees were in full bearing. We afterwards visited the mill, where he showed me various samples of the produce of last year's crop. I was much surprised to find some specimens of oil far surpassing in quality anything that had been shipped to us for the past couple of years. I was, however, on my guard, and simply praised the oil, adding, 'I have been looking at some samples in the *almacen* of Don Andrés Torenó, and saw nothing so fine as this.'

'Ah, well,' said Señor Paderna, 'you know, Don Andrés is not a grower himself, and buys from me and the other growers. He does not seem to have a market for the *Reinas*, as we call the finest quality, though, indeed, his father had, and so you would only see in his warehouse what we call the *medianas* or second quality.'

I thanked Señor Paderna for his kindness and hospitality, and returned to Seville. I was in a most awkward predicament. It was evident that Don Andrés had not been playing the game.

He charged us the same price as that which we had paid his father, and he was sending us an inferior article. But, as I have said, my position was most embarrassing. I was his guest, and had been treated by him and his family with much more than ordinary kindness; and was I, in return, to charge him with having deliberately cheated us? I was in a most crucial fix; and the worst of it was that I could consult nobody, even if there had been any one at hand to advise me, without betraying him. At the same time we always bought by sample; so, after all, we got what we ordered.

The more I considered the matter the more unwilling I became to attribute duplicity to Don Andrés. I was only twenty-two years of age, a mere boy compared with a man of perhaps forty-five. And then his family. Most likely, indeed to a certainty, they knew nothing about his business arrangements. His daughters simply worshipped him, and no grievance would warrant my rending asunder the feeling of unreasoning confidence which they had in their father. And, after all, the past was past; nothing could ever change that.

Nothing was said for two or three days about my visit to Señor Paderna. I knew that Don Andrés had been over to see him on the day succeeding my visit. I had been driven out to a country-house belonging to the family, at Alcalá, some eight miles from Seville, in a most beautiful country. There was a refreshing breeze from the Ronda side, and the place was full of old Moorish relics, mills, and towers, besides the magnificent old castle, one of the finest Moorish buildings in Spain. The country-house of the Torenó family was outside the village, in the valley of the Guadaira, and both the house and its surroundings were very beautiful. Doña Maria took me round, and expressed a hope that, after visiting Malaga and Valencia, whither I purposed going, I should be able to return to Alcalá, where they always spent the months of July and August, and generally September too.

(Continued on page 59.)

## TRAVEL IN WAR-TIME.

### I.—THE LONGEST DAY'S TRAVEL ON EARTH.

WERE a volume to be projected on the influence of the world war on the ways and means of travel, few of its pages would make grayer reading than those allotted to the harrowing day inevitably spent at Haparanda and Tornéa on the only direct route available to Russia, a journey of which those who are forced to make it will keep untreasured memories till they die. The ideal of travel, as enunciated by R. L. S., was not to go anywhere, but to go. On this day of penance the traveller does neither,

but comes to a standstill under conditions that make such inertia anything but enjoyable. First the Swedish authorities must satisfy themselves that he and his belongings can be allowed to leave the country; then their Russian colleagues have to be equally assured that he should be admitted into Russia. It is true that the inquisitors on both sides of the frontier are not only courteous, but even helpful; and if despatch were added to their virtues they would be patterns for all the world to copy. Yet, be

the wayfarers few or many, nine hours would appear to be the shortest time in which it is possible to complete the indispensable formalities. On an occasion last summer an increment of three hundred Russian reservists returning from America added a further two hours to the ordeal, which thus lasted, fortunately in beautiful weather, from seven in the morning to six in the evening.

This, in brief, is what befalls. On the arrival of the train at Haparanda, passports are given up to the police on the train. Special credentials reduced the present writer's detention to a matter of moments, but some of the patients took nearly half-an-hour getting past the aliens officer, and another two hours went in the examination of baggage by the customs. At eleven a crazy and overcrowded steamboat took the entire company across the river to Russian territory, and here two hours more were devoted to the same inspection *de capo*. Why the train for Petrograd could not proceed in the early afternoon is a mystery, as nothing more happened; but it was a little after six when the third bell announced its departure, and during the last four hours of this purgatory the passengers were crowded and jostled on a hot platform with only a few benches. As an alternative, there was a buffet in which, at the modest price of a rouble, one might help himself indefinitely to a score of dishes. Yet such comfort could bring balm only to the soul of a schoolboy on his Christmas holidays.

It would be impertinent for the stranger in the gates to cavil at such delays, but he cannot be expected to welcome them, and even the railway and other officials would scarcely linger unnecessarily in such a spot. For the passenger with time on his hands the distractions are few and far between, though on this particular occasion the returning prodigals from Chicago furnished some amusement by their frank admission that, in addition to fighting their country's battles, they hoped to avail themselves handsomely of the low rate of exchange by turning their dollars into roubles as a nest-egg when peace should come again. Here was a complex psychology of patriotism and nostalgia and personal profit that challenged analysis. One young Russian on the train, after losing his left leg on the Strypa, had been fitted at Moscow with an artificial substitute of German make, and fully appreciated the humour of his cure. Of the war we had a grimmer token in the shape of a Red Cross train full of dangerously wounded Cossacks who had been exchanged for similar measure of maimed Germans the evening before, and among these the sad-eyed Russian Sisters of Charity moved with words of comfort and gentle hands.

At length the train pulled slowly out into the lovely wilderness of fir-trees and streams that make Finland one of the most witching lands on

earth. It was the end of a most imperfect day, an experience tolerable only under the stress of war. Sybarites grumble at hot and dusty days in the train in northern India, in Arizona, or in the Sudan. Let them try the tedium of Tornea, either in its summer heat or in the frozen horror of its winter, and then they may grumble with full hearts. The trial must be made soon if at all, for with the return of peace both these northern hamlets will unobtrusively be relegated to the nothingness for which they were admirably designed.

## II.—ALONG RUSSIAN ROADS.

Those only who have taken charge of wounded men in motor-ambulances can do full measure of justice to the evil of the average Russian road; and, as they vainly try to ease the sufferings of the broken heroes in the stretchers, they bitterly reflect that the only roads in that vast empire worthy of the name are the rivers made by God. For the handiwork of man they acquire a deep and lasting contempt. True, the roads of Turkey are even worse, but their failings excite no comment in the crumbling land of the Ottoman, since the rich Turk stays indoors and the poor Turk tramps barefoot, thankful that so long as he stands upright on his blistered soles these are at least safe from the bastinado. For longer journeys the true believer has his mules or camels, so that even such highways as were constructed in the heyday of his nation, like that which ran from the Bosphorus to Bagdad three centuries ago, have vanished from off the face of the land.

In the present war the lack of good roads is at once Russia's weakness and her strength. It is not to be denied that she felt the want of them woefully when first she hurled her battalions westward against the invader; but the invader felt it too, as was admitted by the German general who, at a meeting of the Higher Command, said, 'It is all very well, gentlemen, to say that Russia made no preparations for this war. Look at her roads!'

There can be little doubt that, with the enemy at her gates before her wonderful rally, the bad roads were Russia's salvation, and the added difficulty of operations in the rainy season lends a curious sense of security even close to the firing-line. The writer used to go out with an ambulance to pick up wounded from an outpost dressing-station two miles in front of the Russian guns and less than five miles from those of the enemy; yet, with trackless marshes between, the chance of sudden risk was no greater than it would have been in Epping Forest. Only the aeroplane is independent of such lines of communication, and the German airmen make up for the inaction of their friends beneath by bombing every Red Cross camp within reach morning and evening. Now and then they kill a few orderlies or horses, but their achievement con-

sists mainly in sending surgeons, sisters, and chauffeurs scuttling underground like rabbits. To decamp in this way when a man is shaving or pulling on his top-boots is trying to the temper, but the result seems disproportionate to the expenditure of bombs.

To some extent the poverty of Russian roads is excused by the vagaries of the Russian climate, since anything approaching a perfect surface is out of the question in a land exposed to such extremes of temperature; but, even making allowance for natural disabilities, it must be confessed that the Public Works Department has taken its obligations very lightly. After the war, perhaps Russia will put her roads in order, and let us hope that these will reach unto the Bosphorus. It will be a needed reform and a worthy crown to her magnificent efforts, for a perfect road is a noble memorial. When Stevenson taught the Samoans to build roads, he did a greater service than by writing *Virginibus Puerisque*. When Wade cut his splendid roads through the Highlands, he won a greater victory than any over the Stuarts.

### III.—ACROSS THE TRANS-SIBERIAN RAILWAY.

Ten consecutive days in the same train cannot, under even the happiest conditions, be regarded as a pleasing prospect; and if the Trans-Siberian Railway, the greatest achievement of engineering with the possible exception of the Great Wall, has its drawbacks in normal times, it is not to be expected that in time of war the tourist should be made exceptionally comfortable on a line that is, with perhaps one other exception, the main feeder of Russia's mighty hosts. Yet he can travel in comparative comfort from Petrograd to Vladivostock, which, seeing that, however welcome to the shareholders of the Cie des Wagons-Lits, he is not wanted by the State, is a concession for which he should be too grateful to permit of his grumbling at the reduction of the service to a single weekly train in lieu of three. There has been some talk, indeed, of restricting the available accommodation to men in uniform, though even this would, in Russia, not necessarily mean the exclusion of civilians, since the railway engineers, students, and Government officials of every grade wear uniform of some sort in that country.

On the whole, the war has made very little difference in the journey beyond necessitating the trains starting on their long journey from the northern capital instead of from Moscow. True, the entire line is under military control, stations and bridges are guarded by Cossacks, and thousands of German and Austrian prisoners are seen working along the line. Such details, however, matter little to the passengers, who are more concerned with the occasional shortage in the restaurant-car. Yet even this is, as a rule, limited to sugar, for which such substitutes as

coloured sweets or jam are occasionally supplied, and the only other inconvenience to which the travelling public is put is to be found in the crowded state of the weekly train, the inevitable result of a rigorously curtailed service.

To the observant eye the personnel of the passengers reflects passing events. These included on a recent occasion a Japanese staff-colonel returning home; a couple of Englishmen on their way back from the Russian front, where they had been detailed to the Red Cross; a wounded Russian officer going to Vladivostock to buy salted fish for the army; a few neutrals, mostly Dutchmen bound for Java; and a 'French' Swiss who spoke perfect German. The talk was also of war, and at the more important halts there was ever a rush for war telegrams that had to be translated for the benefit of the English passengers.

This crossing of Asia is of much interest and no little beauty. West of the Urals, it is true, the outlook is as depressing as only Russian landscape can be on the threshold of winter, when the skies are already gray and the earth is not yet beautified by its mantle of snow. Once that range is left behind, the gloom vanishes as if by magic, and there follows a week of uninterrupted sunshine and of scenery far more captivating than is commonly admitted. We are too apt to draw our inspiration of Siberian scenes from those masters of Russian fiction who have described them from the viewpoint of the convict, who, leaving all hope behind when he came into the land of his exile, would see no beauty in its lakes and forests, but only a prison from which there was no escape save by the gates of death.

Siberia may not give us the best of Canada or California or Norway, but the traveller with an eye to such analogies will see glimpses of all three wonderlands—lake and river and mountain, rolling prairie and silent forest. Of animal life, both wild and domestic, there is greater lack than on any other journey of the same duration. A few hares, an occasional hawk, a brace or two of wild duck on the lagoons, with countless crows and magpies, are all that reward the most patient watcher; while, on the domestic side, pigs, Mongolian ponies (the raw material of future winners on the Shanghai race-course), and, in the easternmost section, strings of two-humped camels, are the only noteworthy stock.

The most picturesque stretch of the journey is that in which the track skirts the shores of Lake Baikal, one of the largest and deepest of fresh-water lakes. Unfortunately this weekly train passes the lake at night, and its presence is betrayed only by a vague glimmer of moonlight, or is missed altogether.

Other evidences of war are met with on the Trans-Siberian, but it would be improper to allude to these. Great reinforcements are

continually going west. In the government of Omsk alone a million sturdy fellows, magnificent specimens of men, were being entrained when the writer passed that way. Heavy trucks of ammunition, carefully packed, and inaccessible alike to rain and prying eyes, were also rolling westward to help in the good work, and on all sides there was that atmosphere of law and order suggestive of military control. It is true that cameras, in normal times a distraction on the trip, were strictly forbidden. On the other hand, the expected severity of the customs officials at Manchuria, the frontier station, proved a false alarm, for neither books nor papers were seized, nor were travellers subjected, as freely foretold at Petrograd, to the indignity of a personal search. The *douaniers*, on the contrary, performed their task with a courtesy and despatch rarely experienced, and were apparently interested only in the smuggling of opium and vodka, for both of which they searched the train with startling results. Indeed, the arrest of a woman and a man, the latter in uniform, provided the one exciting episode of the week.

Be it added that the train, having covered several thousand miles, reached Harbin only an hour late by schedule time, an achievement of which some of Russia's neighbours might well be proud.

#### IV.—DOWN THE YANG-TSZE-KIANG.

In times like these the peace of a great river is worth travelling to see. The river may not be beautiful, for beauty belongs to the little streams that tumble noisily between rocky banks or that twist more silently amid flowery water-meadows. Of either type Britain has abundance. Her greater waters are also picturesque, but Thames, Tweed, and Wye are mere burns by comparison with the Yang-tsze, which comes after the Amazon and the Nile. Such moving roads are navigable for a thousand miles at a stretch, and China is even more than Russia indebted to inland waterways open all the year, carrying an immense burden of merchandise, and supporting a floating population that numbers millions. Up and down this mighty river the natives sail and drift in sampan and in junk, rigged in such fashion as would in happier times have moved Cowes to laughter, yet none the less adequate to bring the primitive craft to their destination in far-off days when the men of Hampshire were stained with woad. The persistence of such craft is part of the Chinaman's retort to the mandate that he should order his house on the model of mushroom civilisations that have come and gone while Cathay pursues the even tenor of its way.

True, progress has begun to infect some of China's millions, who now shave the crown and hold republican sentiments; and the new order patronises such hurried modes of travel as

the motor, railway, and river-steamer. River steamers, whether on the Yang-tsze, Mississippi, or Nile, are of one type, shallow of draught, and with one deck so piled on the other as to give a top-heavy appearance to the whole; but the stern-wheelers of the Nile and some American rivers are dispensed with on the Yang-tsze, and are replaced by a more modern type of craft.

The Yang-tsze itself, once we leave behind the imposing interlude of the Gorges some miles above Hankow, widens to the unlovely replica of all great rivers, its yellow waters racing between distant banks, one of which may occasionally rise above the dead-level to rocky bluffs crowned with fort or temple, according to the requirements of the period. Given fine weather, the descent from Hankow to Shanghai, a matter of six hundred miles or more, is a pleasant experience. The camera gets many chances with the varied river-craft; the sportsman is attracted by the constant passing of ducks, geese, and other wild-fowl; and the student of mankind may spend crowded hours ashore at Kiu Kiang, Nanking, and other ports, each of which has its Bund and the inevitable foreign Concessions that show how far China has travelled politically since the days of Marco Polo. Occasional excitement is furnished by the apprehension of an opium-smuggler, or of one of the lesser culprits who live by contraband traffic in salt. The high profits made out of opium make it worth while risking conflict with the customs officers, and, although China has, like her great neighbour in the west, voluntarily renounced a great State monopoly for the good of her people, thousands of piculs of the drug are still smuggled along the river, and armed encounters and thrilling captures are commonplace events.

For the angler the Yang-tsze has little interest. A stream of such colour and volume is not suited to his quiet arts, and his one comfort lies in contemplating gigantic specimens of a hundredweight or more in the local markets, or perchance in watching the interesting spectacle of natives fishing the lower reaches with trained cormorants. This is chiefly practised towards Christmas. The skilled birds voluntarily give up the prize, and the new recruits are forced to do so by the pressure of a collar that prevents them swallowing it.

Many men are drowned in the Yang-tsze. Such tragedies are the inevitable result of the sudden storms, the careless handling of the native craft, and the crowded condition of the slippery wharves. The death-rate from drowning is further aggravated by a widespread reluctance to go to the assistance of the victim. This attitude is dictated partly by a superstitious dread of defrauding the Water Devil of his legitimate spoils, and partly also by the notion that the rescuer henceforth becomes responsible for the well-being of his protégé.

Apart from the Gorges, and from one or two isolated spots on the right bank, this voyage from above Hankow to Shanghai is not remarkable for its scenery, and, since two or three days of such river-travel are more than enough, it is not without relief that the traveller comes to rest opposite the imposing water-front of Shanghai. The river was policed at this spot in time of war by the vessels of the one considerable navy which then had no sterner work on hand. 'Old Glory' floated proudly from the bows, and, as the strains of 'Dixie' echoed over the water, Chinamen in the Nanking Road turned their heads and wondered that such music could entertain the children of a civilisation younger than their own.

#### V.—THROUGH THE MEDITERRANEAN.

Although the historic sea that has seen the rise and fall of half-a-dozen civilisations is framed in beautiful shores, it cannot be claimed that at the best of times the voyage from the mouths of the Rhone to the delta of the Nile is either enjoyable or picturesque, and on the return voyage the omission of the single port of call still further aggravates the monotony of those days of sea and sky. With the Middle Sea a veritable hive of enemy submarines, the passage is still less enviable, though its safe accomplishment by mail-boats reflects the greatest credit alike on our guardian navy and that of our gallant Ally, and is no small tribute to the seamanship of the men on the bridge.

The present writer has made three voyages through the Mediterranean during the past eighteen months, each more harrowing than the last. The good ship that bore him safely out and home in the second year of the war lies at the bottom, and the good ship that lately brought him to Marseilles had a narrow escape from a like fate in a sea so rough as to preclude any hope of launching boats, so that the appetite of Von Tirpitz must have been further fed with the lives of some sixty women and children.

From Bombay to the Canal the voyage is normal. A few extra formalities on embarking or on landing at Aden or Port Said alone suggest conditions out of the ordinary, and only the somewhat official personnel of the company in both saloons brings its reminder of the war. Christmas in the Red Sea is marked by the usual festivities, though it is impossible to resist the grim reflection that all these children enjoying games on deck may next week find a watery grave. The Canal, interesting as ever since the extension of the conflict to its east bank, finds every one in high spirits at news of recent defeat inflicted on the Turks and their German masters, and only as the mail-boat anchors off Port Said does the more serious side of life obtrude itself with the posting of various orders for boat-drill, for the carrying of life-belts or safety-waistcoats, and for the more efficient

watching out for the emissaries of the Master Pirate at Wilhelmshaven. Yet even this ever-present menace of death is taken lightly. The women behave splendidly. The mothers hide their anxiety, and join in games with the children. The men play cards or deck-games, and reflect grimly that one day we may hang the Pirate and wipe off old scores.

At last, convoyed by a saucy destroyer, the great liner swings silently past the long mole and into the Sea of Death. Let not the murderers flatter themselves that their frightfulness makes any difference to the life on board. On New Year's Eve, right in one of the most dangerous zones, there is wassail in the saloon, with music and dancing later in the night. The decks may be gloomy with all lights out, but within all is merry, swarm the *untersee* devils never so thick!

Perhaps the most trying feature of this part of the voyage is the absence of news, as the wireless is used only for official purposes, and we are deprived of the usual war bulletins that, east of Suez, linked us with the outer world. Our only distraction is an occasional battleship, a patrol, or a brace of mine-sweepers. Once, indeed, there comes a signal of distress—that appealing S.O.S.—from some sinking ship, but it is taken up by other vessels, and, as we learn later, nearly all are saved.

That this policy of 'sink at sight' causes passing inconvenience to travellers in the Mediterranean is not to be denied; but as much might be said of many influences of the war on land. It is a nuisance to have to carry one's life-belt into the dining-saloon for meals. It is a bore to have to interrupt a game of chess or a rubber of bridge for boat-drill. It is a fag to make certain that one's valuables, the notes and other papers sewn in oiled silk, are always on one's person. All this is troublesome, no doubt; but if the perpetrators of these vile outrages imagine that their intended victims pass sleepless nights and anxious days, they are sadly mistaken.

Marseilles at last, one bright winter morning, and then the train through France crowded with all but a handful of passengers who stick to the ship all the way home, so little disturbed by the Frightful Ones that they will not even seek the shorter, safer route to their goal. On this occasion, being on active service, the writer left the ship at Marseilles; but on the last he travelled the whole way to Tilbury without further episode.

Such is the homeward passage in time of war. There are moments, no doubt, in which the sight of little ones, all-unconscious of their danger, playing about the decks fills their elders with quiet horror, but on the whole these go through the days and nights as little troubled by the menace as those who are ignorant of it. Such is the triumph of Tirpitz!

## THE FORESTER'S GIRL.

## CHAPTER III.

THE forest world wakens early. Had Anita Lalonne not been travelling afar in dream-land that morning, she would have seen the station all astir at an hour when the majority of the townsfolk among whom she lived were still indulging in their soundest sleep. When, therefore, at the insistent ringing of the triangle, she had finally wakened, she had dressed too hurriedly even to think of the hour of the day, and it was with almost as much dismay as astonishment that, when the early visitors had departed and a tour of inspection to every part of the Grizzly had been completed, she discovered the hands of the clock pointing to but little after eight. Her first thought—very prosaic—was how hungry she would be before the dinner-hour appointed for midday! She wished she had eaten more heartily of the bountiful breakfast provided.

But Anita had not been brought up to a heavy morning meal, and suddenly, with that quick transition of thought due so often to a mere trifle, a very different picture rose before her mind—the walled garden of a vine-covered inn, small round tables set with crisp white rolls, butter in creamy curls like the petals of a tea-rose, coffee hot and fragrant in porcelain jug; while a gay-coloured parrot, seeking insects among the bushes, wandered about at his own sweet will, whistling snatches of the 'Marseillaise,' or greeting each new-comer with a hearty '*Bon jour, m'sieur!*'

Followed like a flash upon this memory that other which had come to her so startlingly the previous night, temporarily submerged by the events of the early morning and her tumultuous thoughts of Dave.

Now, however, that she had leisure to think, her mind reverted to the Englishman, and she felt a consuming curiosity to know whether it were mere fancy, born of her novel surroundings, or an actual fact that she had known this man in scenes so distant and so unlike the present. Neither him nor his dog had she seen since breakfast, so concluded he must have gone with his friend to Silver Creek. Silver Creek—very shadowy and beyond her ken it all seemed to Anita Lalonne as she stood gazing into ever-receding depths of illimitable forest.

A sense of overpowering isolation suddenly obsessed the town-bred girl, and she half-ran to where, in the cabin kitchen, she could see preparations for dinner already going forward, the shiny-faced, be-aproned Swede cutting up great chunks of 'goat' to be added to the pot wherein a partnership of onions and potatoes was rapidly compounding, while Mrs Axel, her arms up to the elbows in flour, divided critical

glances between her factotum and the condition of the hissing oven.

'Come in, come in, Mees Lalonne!' she called, as Anita hesitated, one high-heeled shoe on the door-step. 'You see I haf to pake again; dose menfolk haf eat all mine breat! Such a peeg pakin' as I mate yesterday—an' hot cakes an' piscuits! Mein Gott—an' now Charlie says he promise to gif some loafs to dose men w'en dey come back to-morrow! Charlie seem to t'ink dot loafs of preat grow like de wilt gooseberries in de corral!' she ended sarcastically, and, kneading the dough with redoubled vigour, shaped it into loaves. 'Dey're some more campers goin' up to de lakes to-morrow. Too bat you can't go wid dem,' she went on. 'Charlie says dot Dave Hardy can't come for you yet a bit, so you'll haf to amuse yourself here. How you like de place?' she asked abruptly, noticing that her visitor was still standing in the doorway, listlessly watching the bread-making.

'It's dreadfully lonesome!' popped tactlessly out of the girl's mouth, while her dark eyes unconsciously glanced at the clock.

'Lonesome!' echoed the gray-haired woman testily. 'If you call de station, wid so many peoples comin' an' goin', lonesome, how you goin' to live wid Dave Hardy?' and with washed-out, wistful blue eyes she looked keenly at Anita. 'But when you're marrit,' she continued, 'you'll haf plenty work to do, same as me, an' den you won't haf no time to feel lonesome. Why don't you go for a walk before dinner? Dere bootiful walks in de woods.'

'Oh,' cried Anita, with an involuntary shudder, 'I'd be frightened to death! I'd—I'd get lost!'

'Nonsense!' rejoined the old woman impatiently. 'What you 'fraid of? You might go an' watch Mister Barrie fish in de creek close by; only, you can't go in dose shoes. Mein Gott, what heels! Ain't you got no udder shoes 'cept dose silly t'ings?'

Anita's cheeks reddened. She was beginning not to like this old woman with the sharp tongue, but she caught at the thought of company in the shape of the good-looking Englishman, so replied meekly, 'I have some boots I could put on, if you think I can find my way to the creek. But I thought Mr Barrie had gone somewhere with the doctor-chap.'

'No, no; he didn't go. So you get your boots on, Mees Lalonne, an' I'll show you de trail, just back of de clearin'; an' den you an' Mister Barrie can bring home some fish,' she added with a short laugh, then busied herself with fuel for the stove, as though the interview with her guest were concluded.

Not at all sure in her own mind that she dared venture on the solitary walk, yet fearful of provoking further reprimand from the busy woman, Anita went to her room, reluctantly took off the dainty shoes, and laced a pair of serviceable boots which some friend with experience of rough life had advised her to bring. Having lingered as long as possible, she walked slowly to the well for a drink; then, passing behind the cabin, stopped to watch a boxing-match between two small orphan kids, just as Charlie, to judge from the trail of tobacco-smoke in the air, and the banging of a wire mosquito-netting door, passed into the kitchen. The cabin windows were open, and Anita caught the words spoken by Mrs Axel as she trotted to and fro.

'What's dot you say, Charlie? *Pretty?* Yah; but what gute is dot to a man like Dave Hardy? What de young fool want to marry a girl like dot for? 'Frait of dis, an' 'frait of dot! An' look at her clothes an' de shoes wid heels as high as de poker! I'm reel sorry for Dave, 'cause she'll be no use to him. She'd petter marry Mister Barrie; he's got lots o' money, an' can puy her fine dresses.'

Anita clenched her tiny hands until the rouged, polished finger-nails went white.

Then she heard Charlie's good-natured laugh as he said, 'Ho, ho, mamma! Don't you be match-makin' now! Mees Lalonne is all right. I tink she's awful nice. She'll get used to de woods after she an' Dave gets marrit, an' she can keep de shoes for de fust baby. Dey're small enough! But where is she now, mamma? Have you seen her?'

Poor Anita longed to run away and hide, but forcing her reluctant steps towards the cabin, she called, 'Oh, Mrs Axel, I'm quite ready now,' then turned aside as though to wait.

'Dere!' declared Mrs Axel, surveying Anita's boots with a softened expression. 'Now you look more sensible. — Doesn't she, Charlie? — Here's Charlie, Mees Lalonne,' she went on; 'an' he'll show you de way. I'm too puzy, an' can't leave mine preat.'

'Yah, yah,' asserted Charlie. 'Just come along, Mees Lalonne. I'spect you'll find Mister Barrie somewheres along de creek, an' den you'll have some company.'

Then, recalling his wife's words, and fearing that possibly the girl had overheard them, he said jokingly, 'You mustn't mind what mamma says; she's always a leetle pit *nervous* when she's making preat!' and he winked and looked so jovial that Anita caught the infection and laughed too.

By the time they had made their way down the shadowy trail to where Bear Creek played hide-and-seek among past and present generations of great trees, soaring hundreds of feet upwards or prostrate in their last resting-places — mammoth trunks shrouded in moss and lichen, and the saplings upon which they had fallen bent to earth in an eternal posture of submission — Anita Lalonne's volatile spirits had recovered, and her face glowed with pleasure and excitement.

'Now,' said Charlie as they reached a small clearing beside the stream, 'I'm awful sorry, but I must get back. I've got to shoe two of my horses before de afternoon. Oh yah,' as Anita looked surprised, 'I got a forge at de Grizzly. We have to do all dose t'ings in de mountains. Well, den, I'll go; but if you wait a leetle while, Mister Barrie is sure to come along to dis pool, for he will have begun fishin' furdur up de creek.' So saying, he turned, and soon his bulky figure was lost among the windings of the trail.

Anita, when her kindly guide had disappeared, felt a tremor of fear, and her first impulse was to run after him. But the quiet beauty of her surroundings; the stillness, unbroken save by the sound of running water and the gentle swish of pine-boughs high above her head; the emerald green of the small 'flat' where the creek widened for the space of a few yards, all soothed and, in an unexpected fashion, wooed her.

'It *is* beautiful!' she whispered softly, then seated herself upon one of the prostrate giants, the great trunk of such girth that her tiny feet in the high laced boots swung well above the ground. Presently, as her eyes searched for the origin of a tap-tapping on some hidden bough, she heard a quick rustle among the bushes, and a glorious gray squirrel, his plummy tail streaming behind, came bounding towards her, hotly pursued by a red-brown dog, whose efforts in the tangled undergrowth were, however, no match for his fleet quarry. With one spring the beautiful creature cleared the fallen log upon which Anita was perched, and clambered up a near-by tree, never pausing until it reached the safe shelter of lofty, interlacing boughs. The dog, baffled and eager, sat on his haunches at the foot of the tree, and suddenly recognising the girl, who with delighted eyes was watching the squirrel hunched up in a crotch of the tree-top, he leaped up beside her, barking furiously, and begging in every possible phrase of dog language that she should assist him in the capture of his prey.

(Continued on page 53.)

## THE SALON TRIBE IN BURMA.

By F. NICOLLS.

ONE of the most interesting, and probably one of the most ancient, tribes of the many found in Burma is the Salon, who inhabit the islands of the Mergui Archipelago. We found them there when Mergui was captured in the first Burmese war in 1826. Of their origin we know very little; but from the publications of the late Dr Mason and other American Baptist missionaries who have passed some time amongst them, it would appear that previous to the sixth century of our era they inhabited the mainland of the Federated Malay States, and were driven out by the gradual advance of the Malays, when they sought refuge on the islands where they are now found. In physical appearance they are somewhat like both Malays and Burmese, and their language would seem to have a strong relation to Malay. According to Dr Stevens, 'they have a traditional belief in the existence of a God, whom they call Too-da, and whom they regard as the greatest and best of beings, who created all things in heaven and earth. They have also a distinct tradition of the flood; after which, they say, God came down from heaven and assigned to the different nations and tribes their habitations and employments.' During the dry season they live mostly in their boats; but during the heavy rains of the south-west monsoon they are found encamped on the islands in parties of from fifty to two hundred, usually in mud huts roofed with palm-leaves, their boats being drawn up on the sandy beach. Their boats are very light, from twenty to thirty feet in length, and made out of a hollowed tree-stem. Their only tools are an adze, cleaver, and auger. A portion of the boat is roofed over with palm-leaves, of which the sail is also made. For ropes they use twisted rattan. Their food is rice and fish, whilst wild pigs are sometimes caught by their numerous dogs. They gather honey in the jungles, and obtain from two to three rupees for the wax in each comb. A few of the more adventurous sometimes come into Mergui, bringing nuts, shells, sea-slugs, beeswax, and other produce, which they barter for rice, salt, and cloth with Chinese and Malay traders.

The Rev. W. G. White, who was for some time Anglican chaplain at Mergui, took great interest in this primitive people, and they had great confidence in him. He mentions that they call themselves 'Mawken,' which word is made up of the words 'drowned' and 'salt-water.' It was explained to him that generations ago, when they first took to living in boats, owing to their oppression by the Malays, they did not build the sides of their boats high enough, and numbers were drowned in consequence. They gained wisdom by experience, and these acci-

dents do not take place now. But, according to what they told Mr White, they still suffer sometimes from the Malays, who occasionally rob them of rice and of the mats their women make for sale or barter. Such incidents may happen in lonely islands, and the Salons are too timid and far removed from headquarters to complain. But they must be comparatively few contrasted with what happened before British rule, when they were often treated with great cruelty, and kidnapped and sold as slaves on the mainland.

For many years, towards the close of the eighteenth century and at the beginning of the nineteenth, Mergui and the surrounding country was the scene of constant hostilities between the Burmese and Siamese. Whichever side happened to be victorious usually killed the adult males, and made slaves of the women and children. A large and populous quarter of Bangkok contains many thousands of the descendants of those captured Burmese and Talines, now treated like other Siamese subjects, and differing only in dress and speech from the Siamese themselves.

The Salons, under British rule, are increasing in numbers, and now number nearly four thousand. Some of them are said to have recently settled in Siamese territory, and to be working under Chinese in the tin-mines of the Malay States. They will probably find the life harder and not so free and independent as on the islands of the Mergui Archipelago. But they will be able to procure arrack and opium, of which they are said to be inordinately fond, and food will be more easily obtained than on the islands. There is plenty of work to be had in British territory, and it would be as well if the Government of Burma took steps to prevent any wholesale departure of the Salons from the Mergui district. They should be encouraged to settle on the mainland, where they might take up land for cultivation, and still go on with their hereditary occupation of sea-fishing. One Rangoon paper advocates their being pensioned. This would tend to pauperise and demoralise them; and in Burma, where there is plenty of work for every one who will undertake it, there certainly would not seem to be the smallest occasion for such an objectionable and costly undertaking.

Schools should be established for the children, when we might hope to lessen the prevailing superstition and ignorance now so universal. It is only by education that we can hope to give this primitive race an opportunity of rising in the social scale, and holding their own amongst the more civilised races with whom they are brought into competition. So far, perhaps, we

have reason to congratulate ourselves that nearly a century of British rule, and leaving them to themselves, does not seem to have diminished their numbers or made their position worse than when they first became British subjects.

This is not much, perhaps, to say in our favour; but when we read of the fate of the Tasmanians, it is something to the good to know that the Salons' contact with civilisation has not resulted in their dying out.

## THE ABIDING SPELL.

By E. H. LIDDERDALE.

IT was in the month of May 1912 that my boy and I went to Touraine, and of the twenty lovely days we were there the most beautiful was the day we spent at the castle of Chenonceaux.

I was glad when, looking out early, I saw the cool and brilliant morning, for I had set my heart on our having perfect weather. Though he was reserved, my boy's mind was transparent, and by many little tokens I had guessed how eagerly he looked forward to this expedition.

He it was who had settled that we should come to Touraine, and now that we were there he made our daily plans. To me it had not greatly mattered where I took him for his convalescence, or what we saw; he had had a touch of pneumonia, and all I wanted was that he should get strong again. So, when first he shyly urged the claims of Touraine, I did not realise how much it mattered to him.

'Heaps of celebrated people lived there, mother,' he said: 'Francis I.—good old Catherine de Medici—the Duc de Guise. I've been reading it up lately. And the castles are ripping. Besides, people—Scotch people—ought to know French history. Scotland and France were friends when England and France were at daggers drawn.'

All this was very plausible. What keener interest could a Highland lad have in Touraine than the places where French and Scottish history intertwine? And he spoke frankly enough. But his face had not yet learned the art of concealment, and I saw that there was more than he chose to say.

Even now Ian has not taken me fully into his confidence; perhaps he still thinks I have not guessed the real reason why he begged to go to Touraine. And I suppose only one who loves him as I do would have read aright the little signs that betrayed him. How discreet he was wherever we went—at Blois, at Amboise, even at first at Chenonceaux! Yet I gradually saw through him. By his silences rather than by his speech, by a kind of veiled and dreamy intensity which came into his face at the sound of a certain name, I divined that the essence of his delight in these places was private and romantic. And every day proved the truth of my intuition.

They were to Ian shrines, places of pilgrimage, because they had sheltered Mary, Queen of Scots!

So I had found out his innocent secret; but not for anything would I have let him see that I had guessed what he did not choose to tell. He must have known that had he admitted his passion he had no ridicule to fear. But he tasted the lover's joy in secrecy, and in hearing the uninitiated speak his lady's name. We often talked of her in those long golden days, and I am convinced that Ian had no idea I saw through his poor attempts at impartiality.

Was it strange that my Highland boy should come so far from home to dream of a Scottish queen? No! For the cold North is redolent of her suffering; if she had joys in Scotland, she had also most bitter affronts and humiliations. Holyrood, Inchmahome, Loch Leven are all too poignant in their associations with her. But in Touraine the shadows had not yet begun to darken; life lay before her still bright with promise. Who would not wander where Mary Stuart was young and gay and lovely?

There was also between Ian's family and the ill-fated queen a traditional bond. It is a legend, well supported and of great age, that an ancestor of my husband's saved her from a dangerous accident when she was hunting near Stirling. 'Black Ian' was his nickname, and we like to fancy that my boy's crisp dark hair and blue eyes are a gift from him.

Ian had known the tale from babyhood, and doubtless the thought of this house-link with his lady gave to his dreams of her their inmost charm. How long he had cherished his cult I do not know, but I found him surprisingly well read in Mary's history, and prepared to be combative in her defence. I would not harass him by controversy, however, and dissembling my less romantic view of her character, I always dwelt on her beauty and her misfortunes in such a way as left him content.

And so, despite the difference in our outlook, we pulled well together in foreign parts.

An imaginative boy of fifteen is a delightful travelling companion. He may be restive beneath the yoke of Baedeker, and blind to beauties that charm his elders; he is likely to be insular—one would not have him otherwise at that age—but never is he indifferent. At every step he is alive, enjoying; prompt in admiration, racy in dislike.

Thus, where I plodded, my schoolboy flitted bee-like from one attraction to another, ignoring

much that I would have had him observe, but tasting at times, I believe, a burning ecstasy of enjoyment, the fruit of his secret worship, to which older, duller folk are strangers.

Is it ever winter in Touraine, I wonder, and do they have storms there, and darkness and falling leaves? Looking back, I always see its jewels of stone as we beheld them then, set in a world of flowers, and radiant with sunlight and the song of birds. Far and wide through that promised land was the same glory of lilac and apple-blossom, chestnut, judas-tree, magnolia; the grim, medieval fortresses, their warfare accomplished, stood like rocks in a sea of blossom; the lovely decorated manor-houses of a later age seemed to wear the spring beauty for their own delight.

Ian was talkative in a rather excited way while we ate our *déjeuner* at the inn outside the park of Chenonceaux. But he grew sober as later we walked up the broad alley, iris-fringed, which leads to the stately old house where Mary Stuart and Francis II. spent their brief honeymoon; and when at last, in all its enchanting loveliness, it beamed upon us, he was dumb.

Of course, I had read about Chenonceaux, but cold print had not prepared me for the indescribable charm of this long, gray, irregular mansion, so rich in delicate and fantastic ornament, standing bridge-like on arches astride the placid, blue waters of the river Cher. The vanished lives to which it witnessed came with almost startling vividness before me as we wandered through the ancient rooms, so little dimmed by time, that had beheld the French Court of the sixteenth century. But when we lingered to look up-river through a window set deep in the embrasure of a tiny panelled chamber, while in the silence the water rippled beneath us, whispering its endless secret to the old house, I know I felt as though we had strayed from France into fairyland!

Ian said nothing; even when I spoke he did not answer. How much of Chenonceaux he saw with the bodily eye I cannot tell; he might almost have been blind and deaf as he drifted, silent, in my wake. Yet I am sure that his perceptions were acutely, absorbingly alive.

We emerged from the cool, shady rooms into the May brightness, and I suggested that we should go round the sunken garden which lies beside the house.

'Aren't you coming?' I said, turning round; for I saw that my boy was not following. 'You know they say it was laid out by Catherine de Medici, so you ought to like it!'

Ian had the 'penchant' of so many innocent youths for prisoners, forgers, and crime in general; I used to think that Catherine ran Mary hard in his affections. But to-day she failed to attract him.

'Too formal,' he said, casting his eyes over the demure, geometric parterres of Mary's terrible

mother-in-law. 'I hate stiff flower-beds. And I've had enough of Catherine for one day—the house is choke-full of her. I shall go and explore over there instead;' and he pointed to the thick woodland which bounds the Chenonceaux gardens.

'Very well,' I called after him. 'I'll wait for you by the river;' and I went on my way.

I did not wonder that Ian longed to be alone in this exquisite place that had seen his lady in the heyday of her youth. As I leaned upon the low gray wall which borders the stream, the magic of Chenonceaux stole upon me like an all-pervading fragrance. All the tender beauty of bygone springs seemed to linger there distilled, and blended with the mellow loveliness of ancient homes. Beneath me flowed the gentle water of the Cher, fringed by overhanging clusters of valerian and pink monthly roses. I followed its onward journey till, more like a still, blue lake than a river, it vanished beneath the supporting arches of the great house whose windows seemed to contemplate me with their long, mysterious gaze.

Almost with an effort I broke the spell, and turned to look for Ian; I wanted him to share this lovely view with me. But though the edge of the forest where I knew he was wandering ran parallel with the stream not a stone's-throw from where I stood, I soon gave up the thought of pursuing him. The trees were densely packed and full of leaf, and the narrow rides which pierced them in various directions were not as they appeared at a distance, mere eyelet-holes cut in the green, but lengthy alleys leading I knew not where.

I decided to let my boy find me instead, and rested myself on a fallen trunk at the mouth of one of these alleys, where I knew he would see me if he happened to cross it lower down.

It was beautifully still waiting there in the quiet shade, and listening to the music of the wood—more peaceful even than silence. Flies hummed and darted about me; a thrush sang in swift gushes; and far away, as though from the depths of some aerial avenue, the cuckoo called unwearyingly. There was something fascinating in the perspective of the long, narrow glade before me; I had a sense of looking through a reversed telescope at the little disc of lavender-blue sky, remotely visible, which closed its farther end.

This leafy tunnel must once have echoed the sound of horns and hounds, the cries of huntsmen, all the pleasure of the chase. But now it lay solitary as a glade in a virgin forest. Solitary, yet not alone; for the past lingered there, an almost palpable presence—more vividly even than in the old house I was aware of its brooding nearness.

So filled was I with the sense of a vanished order that the world I live in seemed to loose its hold upon me, to let me go free. 'I heard

no more the busy beat of time.' No otherwise can I describe the mood which stole upon me.

Yet I was not dreaming; I was awake; and gradually I began to be uneasy. It was not the sharp-edged sweetness of fair things turned to dust that pained me, nor the restlessness which haunts one's mind in lovely places; the sense of the little cup and its vain effort to empty into itself the unfathomable sea of beauty.

Fear it was that came upon me, slowly, like white mist; fear of something unknown, unimagined, approaching as stealthily as eclipse grows over the sun. Was it personal grief—heart's shipwreck—moving towards me, or some calamity vaster still? I could not tell; this fear had claws that gripped me, but no face. I trembled, left alone with it in the warm, flickering shade.

The very aspect of the wood seemed to change before my eyes, to lose something of its inexpressive calm and density, and stand charged with secret meaning. This canopy of foliage and song was but a veil interposed between me and that which lurked there withdrawn but still aware, like a hermit pondering human things. Dumbly through the green and gold the past reached out to me, seeking in vain to utter its inscrutable warning. It knew—it knew the undreamt-of future.

I sprang up suddenly and called to Ian; I was afraid to be alone any longer.

'Ian! Ian!' I cried again and again, terrified by the loneliness of the place. I was pursued by the idea that the boy might be in some dreadful danger. But no answering shout came from the fastnesses of the wood; not a twig snapped, not a bough moved. Far and near silence had fallen; only the cuckoo called with almost sinister persistence.

One cannot measure suspense; I do not know how long I stood there crying Ian's name. Perhaps it was but a minute or two before, with disconcerting suddenness, a living creature appeared in that deserted place. Far away a deer slipped noiselessly through the wall of the glade and halted, listening, his graceful antlers poised with an air of tense and dainty suspicion. He might have been an enchanted thing as he stood unmoving in the grassy track, a silhouette of dappled fawn upon the all-pervading green. Then at a bound he was gone; the wood had swallowed him up.

I think I was more relieved than taken aback by this apparition, for I hoped it was not my voice, but Ian himself, moving somewhere in the depths of the wood, that had startled the shy beast and sent him roving. And I set out down the glade, thinking to meet the boy, or at least to reach him with my voice from the spot where I had seen the deer.

I hurried; but before I had gone many yards, again I was aware of a living creature, not this time emerging from the greenwood, but already

present in the distant track. A youth, tall and dark-haired, was slowly moving towards me bareheaded. I stopped dead, and my heart, that had been beating wildly, gave one great sickening bound.

Incredible in such a place, he wore the gala dress of my husband's clan! At first I knew it by its colour, but as he came nearer I espied its every ornament and detail—the tartan of the kilt, the rich, archaic sporran, the draping of the dark-green scarf. Only in one respect was it unfamiliar—a knot of white ribbon conspicuous on the breast. As he walked he passed through a thin shaft of sunlight, and I saw the great golden cairngorm in the clasp on his left shoulder flicker a moment and then go out.

He was young for such trappings, neither boy nor man; but he carried them well, for he was slight and lithe. In the heavy silence I heard him speaking, his face turning as though it looked towards some one on his right hand; and yet he was alone—quite alone!

How was it that I did not know him? Something must have intervened between my faculties and the vision; not till he came within fifty paces of me was it withdrawn. And then I tried to scream and could not, and my scalp crept with terror. He was older a little, riper, a head taller; there was in his bearing, as he walked solitary, yet deferring to the empty air at his side, a courtly reverence strange to me; *but it was Ian!*

He was but ten paces off when suddenly he turned his face, and seemed vaguely to behold me. A great light was in it, an extraordinary rapture. I had never seen him thus transfigured. Slowly the bliss faded from his wide blue eyes, like a flame dropping from radiance to mere glowing; a spasm of pain crossed his features. I went right up to him, and still he stood in a dream, looking blankly down upon me, while little by little the everyday world resumed dominion over him. He might have been a diver rising from the floor of the deep sea. I think he did not yet recognise me perfectly, but I cannot be sure; my senses swam without warning, and for a few seconds I was almost unconscious.

When I came to myself I was sitting on the ground with my back to a tree; some one stood over me gently shaking my arm.

'Wake up, mother!' The voice was Ian's, yet I needed all my courage to look at him. If it had been still the changeling Ian who spoke I should have fainted outright.

Not daring to raise my eyes, I opened them, and saw with astonishment and unspeakable relief my schoolboy's stout lace boots and the hem of his gray flannel trousers. Somehow, they gave me confidence; they seemed to bind reason more firmly in its seat. I could not have borne to discover the kilt and the jewel-headed dirk thrust into the stocking, all the para-

phernalia of a dress which Ian had never yet worn.

Plucking up heart, I looked from the feet to the face. Thank God! it was my Ian come back, his own diminished, boyish self; in outward semblance unchanged, but white and almost haggard.

'Wake up, mother!' he repeated. 'Are you ill?'

I did not answer. I would not admit that I was frightened at his expression. I was trembling as visibly as he, and that, I think, made him bold to confide to me what he could not contain.

He knelt down and put his mouth to my ear. 'Mother, what's the matter?' he whispered; and I felt the painful fluttering of the hand he had laid on my shoulder. 'You—you look as though you'd seen her!'

'Whom?'

He was silent a moment. 'She's here—I've been with her,' he breathed, as though he could not bring himself to utter the name. 'She's lovely—different from what I thought, and yet like. They were riding in the wood, he and she. Mother, he's a rotter. I know he is! Her pony shied at a deer that jumped out; I caught his head in the nick of time, or he'd have run away. She let me help her down, and she walked with me all by herself.'

He paused, and I felt the stress of feeling that shook him body and soul. 'She spoke to me. It was wonderful—I can't tell all—I can't remember. But she said, "France and Scotland. Scotland must help France—Scotland must help," twice over. Mother, why did she say that?'

I thought he and I were fast losing what remained of our sober wits. Clearly he was too far gone to rouse himself; it rested with me to bring us both back to sanity.

With a great effort I got up, and looked straight in his disordered face. 'Stop, Ian!' I said very sharply. 'Do you know you've lost your camera? Where is it?'

Thus shocked into reality, he stared vaguely about him. 'Oh! I don't know,' he answered, as though indifferent to his precious kodak. 'I dare say I left it at the inn.'

'Then we'll go at once and ask for it,' I said, and I slipped my arm through his, determined to have done with that ominous place.

But Ian hung back, and I saw he had barely taken in what I said. 'I think I'll just go down there again first,' he said, turning his head and looking wistfully along the empty glade.

At that I confess I broke down, utterly beyond myself with terror. 'You'll do no such thing!' I cried. 'Ian! I forbid it! You're to come with me—this moment—now!'

'Oh, all right, mother! Easy on. I'll do what you like.'

He spoke rather wearily, and as he walked with me, uttering not a word, I felt secrecy steal like an impenetrable crust over the hidden fire of his heart. It was clear to me that he would say no more unless I pressed him.

When he had found his camera we ordered coffee at the inn, and drank it to the sound of our own wandering talk; we were absorbed by that of which we could not bear to speak. As we slowly rallied from the shock of the experience and reverted to our normal selves, I think we should both have jumped at the chance of discussing it without reserve.

I knew, indeed, perfectly whom Ian believed he had seen; he would have had no need to enlighten me. But did he realise in what eerie fashion he had shown himself to me? And what was I to think of the foreboding that had weighed me down? It would have been a great relief to talk freely!

But Ian was shy and proud, and regretted, I am sure, that he had made me free of his adventure. If he secretly wondered what had frightened me, he did not betray the fact. And as for me, though I am a Highland woman, I dread the dim, unfathomable regions of the mind; I would rather keep to its broad, well-travelled pathways, and see those I love walk with me there. Least of all would I encourage a growing boy to stray from them.

We left Touraine for Scotland a week later, and not another word passed between us about the glade in the wood.

Ian grew rapidly during the two years that followed, the child in him, even the delightful boy, making way for the man. How far he pondered his experience in France I do not know. He seemed absorbed in the many interests of a public-school boy to the exclusion of more visionary loves. I should have supposed that he had ceased to think of Mary Stuart had I not noticed that he never spoke of our day at Chenonceaux if he could help it. His silence on that point gave me pause; one could not be sure of him. He had the captivating frankness of manner which is so often found in reticent people.

But if he forgot, his mother remembered! Often after our return my thoughts harked back to the vision, and it was not till I had told it to my husband and seen it in the comforting light of his good sense that the misgiving it had left with me vanished away.

So securely happy was I in that sunset of the world's peace that even when the storm began to darken over Europe I did not in the least realise to what catastrophe it might lead. My husband was in London on business during the end of July and the beginning of August 1914. Ian was at school, and had arranged with me that when the holidays came he should go straight to Inverness, where the

head of the family was to be married with much rejoicing. Ian was to be best man to this favourite cousin, and looked forward with no little pride to representing his own branch of the house on the occasion. It is a weary journey from our home in Perthshire to Inverness, or I should have tried to go too, for the pleasure of seeing him and so many of our kinsfolk in the traditional bravery of the clan.

Left alone in glorious weather, I confess that I did not read the papers very carefully, but spent my time in the open air, sketching and gardening. It was not often that I had such complete leisure. If I foolishly took it for granted that the Continental crisis was to end well, I erred in company with many another happy woman.

The 5th of August, Charles ——'s wedding-day, was very hot and still. I stayed at home till the late afternoon; then, having told the servants where to look for me in case of need, I started to walk by a sheep-track over a shoulder of the hill at the back of our house, and so down its hinder slope to a lonely burn that I love.

It is a little burn, but a spirited one, which runs curving and leaping among gray boulders between steep, heathery banks; there are brown pools to dream over, and creamy waterfalls whose sound brings coolness to one's very soul. That evening the sunset had fired the surrounding moors with all the colours of the Book of Revelation; they lay as though molten, exhaling the heavenly scents of thyme and ling and bog-myrtle. I watched the glory change and deepen with the departing sun as I sat in the shelter of a line of alders beside the river. Far and wide there was quiet, but for the melancholy cry of peewits, the chuckle of grouse running hidden in the heather.

How well I remember the look of things in that last hour of heart's ease!

Strange that I, who had received the wood's dark warning at Chenonceaux, should now have had no presentiment! No doubt I should have been less densely tranquil if the world of action had not seemed so remote. But for two days I had received no news of it; our car had broken down; the carrier had forgotten to bring my *Scotsman*. So I sat unsuspectingly with a book in my lap, and let my thoughts wander where they would.

And then at a single stroke the old world died for me and this eternity of care and dogged waiting was born! I heard a shout from the hill-side between me and the house, and looking up, I saw Ian standing on the skyline.

'Mother!' he called, staring down into the valley.

The sight struck cold to my heart, for I imagined him making merry far away in Inverness. Why had he suddenly come back? I

jumped to the absurd conclusion that his father was ill in London, and had wired to Ian, who had rushed home to break the news.

'Mother!' he called again, and I stood up, answering shrilly. It was clear that he heard me, though I was hidden among the trees, for he at once began to run in my direction. It was a break-neck descent! I watched his long scarf flying behind him, the jerking of the sporrans above his bare knees; I saw his dear feet strike little puffs of yellow dust from the heather as he plunged downhill.

Then, with a final mighty bound, he leapt into the shady path below the alders. He had taken the shortest course down the steep brae, and had landed a stone's-throw from where I stood. Now he stopped a moment, almost winded by his pace, and I heard him panting as though with more than the mere stress of speed.

'Here I am!' I cried, though I was in full view. 'What is it?' and he ran towards me, stumbling over the uneven ground.

So young and goodly he looked in his finery, so radiant was his face! Plainly he brought great news, and yet my spirit turned faint with apprehension. That white breast-knot—his wedding favour—I had seen it once before . . . and the jewel—the jewel on his shoulder . . . a sunbeam pierced the shade and found it as he came, and again for one dreadful moment I saw its golden fire!

It seems to me now that I knew what he was going to say before he spoke.

'It's war!' he cried. 'We've declared war on Germany. . . . She's attacking France! I'm going. . . . I'm nearly eighteen. . . . Mother! you must let me go!'

I couldn't answer; I could only look at him dumbfounded while he stood before me so tall and gallant, his face aglow with mystic elation as on that forgotten day.

He came still closer, and awe sounded in his lowered voice.

'It's what *she* told me at Chenonceaux—she said, "Scotland must help." She knew. . . . It's Scotland and France again—Scotland and France!'

#### THE SPIRIT OF JOY.

HANDMAID of God, great Nature pours God's gift  
Into weak human hands; yet man perceives  
But little of the wealth he thus receives,  
And scarce allows the beauty to uplift  
His heavy heart; with blinded eyes, deaf ears,  
He takes his pleasure or endures his pain;  
Sees but an accident in sun or rain;  
Knows naught of Joy, but only hopes and fears.

Yet Joy is Nature's secret source of life,  
Obedient to the Infinite God within,  
His Spirit ruling her; she knows not sin,  
And all her energies are noble strife;  
Wisdom and Love she knows without alloy,  
And of these twain are born the Spirit of Joy.

FRANCIS ANNESLEY.

## SEVENTH SERIES

### A GLIMPSE OF MANNING AND WILBERFORCE AT LAVINGTON.

By the Venerable Archdeacon SINCLAIR, D.D.

ON April 14, 1917, died, in her cottage at Norwood-Lavington, Granny Saunders, one of the last who remembered Cardinal Manning in his Church of England parish. Her recollections suggested the putting together of some reminiscences of that very eminent ecclesiastic, and his brother-in-law and parishioner, the famous Bishop Samuel Wilberforce.

One of the most beautiful scenes in Sussex, and therefore perhaps in England, is contained by the twin-sister parishes, Wool-Lavington and Graffham. They lie under the long rampart of the South Downs, on the north side, where the vast woods of Charlton Forest, which occupies the southern slopes, have descended over the northern crest, and clothed the steep declivities with a dark hanging robe of beech and birch, juniper and yew, from Duncton Beacon westwards. The rich glades and sheep-meadows, from which Wool-Lavington takes its ancient name, slant up into the shelter of the trees and the hollows of the hills like lawns of velvet turf. From the same wooded steep many a spring of purest water gushes forth, especially after heavy rains, and gives the pleasant sound of singing streams to the leafy lanes ere they collect together and form an affluent of the charming river Rother, which dominates the wide valley below, on its course from Liss, Midhurst, and Petersfield in the west, past Petworth and Fittleworth, till it joins the Arun at Stopham Bridge. To these 'lavants,' as the local people call them, Lavington owes the main part of its name; for 'lavant' means a spring rushing forth from a hillside.

Lavington Park (destined to belong to Bishop Samuel Wilberforce) was owned in the time of Queen Elizabeth by Lord Lumley; from him, the year after the Spanish Armada, it was bought by Gyles Garton, a substantial citizen of London. Gyles had a son of knightly rank, Sir Peter; and they built a fine Tudor house of red brick, with towers at the angles, and an embattled gateway at the corner of the pleasure-grounds by the road up the hill, which last still exists.

Sir Peter Garton's estate passed, by a series of heiresses, to Charlotte Orme Bettessworth, who married John Sargent, of another Sussex family,

a man of culture, who published a book of poems, and was a friend of the Sussex poet Hayley. John Sargent and his wife pulled down the Elizabethan mansion, and, according to the taste of the time, built the square Georgian house of white brick, with a balustrade all round the top (the windows had suffered from a temporary vagary in the manufacture of glass which produced a purple tinge), which was familiar during the ownership of Bishop Samuel Wilberforce.

John Sargent died in 1831, and was succeeded by his son, the Rev. John Sargent, who had married the daughter of a neighbour, Abel Smith the banker, first-cousin of William Wilberforce the liberator, elder brother of Lord Carrington, and owner of the beautiful estate of Dale Park, on the south slope of the Downs, near Arundel. He had died in 1779, two years after his marriage, leaving an only child, Mary, who was brought up by her uncle and aunt Wilberforce, and married the Rev. John Sargent in 1804.

The Rev. John Sargent was educated for the bar, but at Cambridge came under the influence of Simeon, one of the leaders of the evangelical revival. Born in 1770, and educated at Eton and King's College, Cambridge, he was ordained in 1805, the year after his marriage, became rector of Lavington and Graffham immediately on his ordination, and remained in that office till his death. He died in 1833, two years after his father. He was succeeded as rector by Manning, who had been his curate. The Rev. John Sargent's son predeceased him; and consequently his daughters, Emily (Mrs Samuel Wilberforce), Mary (Mrs Henry Wilberforce), Caroline (Mrs Manning), and Sophia Lucy (Mrs Ryder), became co-heiresses of Lavington Park; the eldest, Mrs Samuel Wilberforce, inherited on the death of her mother, Mrs Sargent, a lady of high character and influence.

It was in 1828 that Emily, the eldest daughter, married Samuel Wilberforce, who took deacon's orders the same year, and afterwards became Bishop of Oxford and of Winchester. In 1834 Caroline married Henry Edward Manning, rector of Lavington, who in 1840

became archdeacon of Chichester, and died Cardinal Archbishop of Westminster. Caroline died in childbirth in 1838, and was buried with her baby in Lavington churchyard. In 1850 Archdeacon Manning seceded to the Roman communion. Bishop Wilberforce became the owner of the Lavington and Graffham estates in right of his wife, and enjoyed a life of ideal happiness there, when he could spare the time from Cuddesdon (the episcopal home of his Oxford diocese), and his later episcopality of Winchester and Winchester House, St James Square, in London. He never lived at Farnham Castle, the historic seat of the Bishops of Winchester, as his predecessor, Bishop Sumner, who had retired with Farnham Castle as his residence for life, outlived him.

The two brothers-in-law, Wilberforce and Manning, were both devoted to Lavington. When, thirteen years after her marriage, Mrs Wilberforce died in 1841, the Bishop found some consolation in the charm of the scenery and in the interests of his young family. Writing from Lavington to his sister in 1844, he says: 'Life here is so unlike my life anywhere else. I was up alone on the hillside between six and seven this morning, and anything more lovely you cannot conceive. The slanting sun was throwing its brightness from behind me on the glorious prospect, far up into Surrey; Albury, the Hogsback, Leith Hill, and the rest; and all very distant country looks so beautiful—a sort of Delectable Mountain feeling hangs about it. I suppose it is the secret instinct after "the land that is very far away" that stirs within one.' A long terrace-walk in the pleasure-grounds on the side of the hill, shaded on both sides by trees, is known as the Bishop's Walk; and at the top of Lavington Down he erected a wooden tower in order to increase the extent of splendid view around. On May 31, 1873, just before his tragic death, he wrote to his daughter-in-law (it was the annual occasion of visiting his wife's grave, and laying flowers upon it): 'God's world in its beauty, animate and inanimate, around me: the nightingale singing His praises, and all seeming to rejoice before Him.' A month later he was thrown from his horse when riding with Lord Granville on those very Surrey hills at which he used to gaze, and was instantaneously killed. And so in 1838, on the death of his wife, after five years of married life, Manning writes: 'Till the last six months I have never known what it is to have irresistible local affection. Once a little self-denial would have made all places alike; for all that makes one place differ from another would have followed me like a shadow. Now there is only one place unlike all others, and that is unchangeable.\*' In his later days he refers to 'the love I feel for the little church

under the green hillside, where the morning and evening prayer, and the music of the English Bible, for seventeen years became part of my soul.'

It was in these surroundings and amongst these associations that Manning spent his ministerial course in the Church of England. He was well known at Oxford; had been scholar and fellow of his college, as well as president of the Union; and was becoming deeply interested in the Tractarian movement (1833-41). His dry humour was characteristic through life; and a story illustrative of his ready versatility and quickness in answering used to be told of him by a contemporary (afterwards a professor) in reference to his Union days. There had been a debate on Protection and Free Trade, and Gladstone had been declaiming about one particular duty, that on the Spanish article called *barilla*, which is a plant used in the making of glass and in the production of iodine, potash, and alkalies. The removal of the duty by Mr Vansittart, Chancellor of the Exchequer in the early part of the nineteenth century, caused the destruction of the kelp-trade on the western and northern coasts of Scotland, on the coasts of Ireland, and in the Orkneys, and led to great and prolonged distress. As they left the debating-room, the subsequent professor asked Manning (who belonged to a business family) if he knew what *barilla* was. Manning, who was very human, and not accustomed to admit ignorance, bravely replied with imperturbable gravity, 'There are two ways of loading a ship. One is when the cargo is entirely of one kind, as wheat, timber, iron, or cotton. The other way is when it is a mixed cargo. In that case it is called *barilla*.'

Another glimpse of Manning at Oxford has been left by Archbishop Tait. When Tait first came up to Balliol College as a young Scotsman, he received a kind welcome from George Moberly, a tutor of the college, afterwards Bishop of Salisbury, who asked him to breakfast next day, which was Sunday. The other guests were Henry Edward Manning, who had lately taken his degree, Herman Merivale, and Stephen Denison. Moberly (whom long years afterwards Tait himself consecrated to the episcopate) recommended Manning to Tait as a safe guide for his opening career at the university; but they never became intimate.

John Sargent offered Manning the curacy of Wool-Lavington, Graffham, and West Lavington. In those days, when the clergy were not so numerous as they are now, nor services so multiplied, it was quite usual for an assistant-curate to help in several small parishes in turn. Sargent had a friend, the Rev. James Tripp, a friend of the Egremont family, a man of saintly character, who had been a disciple at Cambridge of Thomas Scott and Charles Simeon, and was now rector of Hardham and Up-Waltham, two

\* F. G. Brabant, *Rambles in Sussex*, p. 58.

small parishes west and south of Lavington. It was arranged that Manning should assist the two rectors of Lavington and Hardham. Members of the rector of Hardham's family recollected Manning coming to discuss matters with their father before his ordination, in the usual dress of the time, a blue tail-coat with brass buttons, nankeen tights, stockings and shoes, and having a friendly romp with them round the garden. He was a serious-looking young man, with an oval face, keen piercing eyes, and an agreeable smile; of middle height, slender figure, and good bearing. A very pleasing drawing of him has been left by George Richmond, R.A.

Everybody in those days rode on horseback; the first railroad was made only in 1825, and even by 1842 the railroads of the country covered only eighteen hundred miles. Sussex at that time was exceedingly arcadian in its remoteness and simplicity. Up-Waltham, which has an interesting little Norman church, a small semi-circular chancel, and no vestry, was high up in the solitary folds of the Downs. One Sunday afternoon, Manning, thinking the rector of Hardham had too many of the duties of the day on his own shoulders, rode over to Up-Waltham on his gray mare after his own work, entered the little church while service was proceeding, and, as there was only one surplice, divested the rector of it before the congregation, and himself mounted the pulpit.

Manning, like many who have joined the Roman Church, was in early days strongly opposed to its claims; the members of the great communion which he subsequently joined, and by which he was so highly honoured, will not think the worse of him for that. One day he was riding with the rector of Hardham and another past Arundel Church, the chancel of which was known as the Fitzalan Chapel, and had never been used for the reformed service of the Church of England, though it was open to the rest of the building. Some one asked why this was so, and the answer was that it belonged to the Dukes of Norfolk, who were generally Catholics.\* 'Tie the tin kettle to the tail,' cried Manning, '*Roman Catholic, please.*'

During another ride Manning was illustrating to the same friend the usually alleged risks of the confessional. His view, of course, subsequently became very different. 'There was an ostler,' he said, 'at an inn in these parts, a bright and hearty lad, who went to make his Easter confession to the priest. He walked up to the confessional cheerful and contented. "What is your grief, my son?" asked the priest. The young ostler had nothing on his mind except very general matters. "Did you never grease the oats for the horses stopping at your inn?" †

inquired the priest at length. "I should be ashamed of myself even to think of such a thing," answered the lad with indignation. Next year he came again, sad and dejected, with all his jauntiness gone. After the usual questions, the priest said, "And have you never greased the horses' oats?" "Often and often," replied the ostler, with downcast looks, "since you told me about it."'

It has been mentioned that John Sargent, the rector of Lavington, died in 1833, and that Manning's curacy ended with his appointment as successor. It was before the end of the twelvemonth that he married Caroline, the late squire and rector's daughter, whose elder sister Emily had married Samuel Wilberforce six years before. Manning and his wife were married in the little church at Lavington by Wilberforce; it is recollected still that all the girls of the village school wore white hoods and white capes on the occasion. Wilberforce, who was born in 1805, and had taken his degree at Oriel in 1826, had been ordained at the end of 1828, and taken the curacy of Checkendon, near by Henley-on-Thames. In 1830 he had become rector of Brightstone in the Isle of Wight, and in 1836 rural dean. His subsequent career was rapid; in 1839 he was appointed by Bishop Sumner to the archdeaconry of Surrey; in 1840 canon of Winchester, and rector of Alverstoke; in 1841 chaplain to the Prince-Consort; in March 1845 he became Dean of Westminster, and in October of the same year Bishop of Oxford. The secession of his brother-in-law, Manning, in 1850 somewhat checked his influence, followed as it was soon after by that of his brothers, Archdeacon Robert Wilberforce, and Henry; also, the leading part which he took in the revival of Convocation was unpopular at Windsor Castle.

Manning and his wife lived at the charming house of Beechwood, near the eastern gates of Lavington Park, within sight of the home of the Sargents and the Wilberforces. The following notes are reminiscences of old Mrs Esther Saunders, whose recent death at the age of ninety at her daughter Mrs Todman's cottage at Lavington was the introduction to this paper, and who enjoyed talking of old days as she sat in her chimney-corner. Her father lived at the hamlet of East Dean, and was a charcoal-burner in Charlton Forest. As he passed through East Dean he used to call out, 'Now, boys, listen! You'll live to see corn threshed without flails, and carriages running without horses!'

Manning was an enthusiastic church-builder; he built the present church at Lavington, which is of very simple, correct Early English architecture, and rebuilt the church at Graffham. Graffham Church was rebuilt a second time, and very admirably, in 1875, in memory of Bishop Wilberforce. Its cylindrical Saxon font is the only trace of the old Anglo-Saxon church before

\* The duke of that date, Duke Bernard, who succeeded from a distant branch (1815-42), was not a Roman.

† A trick to prevent horses from eating their feed of oats.

the Normans. At West Lavington Manning had a curate, named Laprimaundaye, who built the church in that hamlet at his own expense, and afterwards followed his rector in his change to Rome. The architect of West Lavington was Butterfield in his early days, and he probably designed the church at Lavington also. It is interesting to remember that Richard Cobden, the apostle of Free Trade, was buried in the churchyard of West Lavington; he was born in a farm-house in the adjoining parish of Heyshott. Laprimaundaye was noted in the parish for his generosity. From 1840 Manning was always known as 'the Archdeacon;' and it was by that name that he was still familiar to the two or three old people who of late recollected him.

There was a school for girls at Lavington, and for boys at Graffham. Children from farms and cottages used to walk together as far as the well-known trysting-tree between the two villages, which they called the Weeping Willow, but which is in reality a lime with branches drooping over an aged wooden seat. The mistress of Lavington School was a north-country woman. Food was provided every day for the girls by the Sargents at the great house—meat one day, soup another, pudding a third, and so on. The mistress used to urge them to eat as much as they could; the children liked that school.

The archdeacon was on kindly terms with all his parishioners, especially the young. He was exceedingly conscientious in his duties, and had the reputation of giving away all that he had. The names of the villagers in his time have their representatives at the present day, such as Albery, Ayling, Blunden, Boxall, Bridger, Brockhurst, Challen, Ellcombe, Hedger, Holden, Howick, Pescod, Todman, West. Dame Esther Saunders's maiden name was Ayling. She recollects meeting the archdeacon one day on his old gray mare, when he asked her with a smile what he could do for her. 'Nothing, sir,' she answered, 'except marry me to Saunders next week.'

When Manning's wife died he was petrified with grief; it was with difficulty that he was torn from her grave, into which he had stepped; he seemed hard and indifferent to all his surroundings. This went on week after week, and one of his neighbours consulted his old friend the rector of Hardham as to what could be done. That wise man rode off to Beechwood, and began talking about the wife, recalling all her virtues, charms, and many gifts. Manning listened, at first as cold as ever; but gradually his heart melted, he burst into a flood of tears, and afterwards thanked his friend most sincerely for thus lifting the load of numbness from off his mind.

When Manning had made up his mind to secede, he was calling at Woodcote farm, where Mrs Saunders was then living, and said to her

neighbour, Mrs Ellcombe, that he had not seen Esther for a year: where was she? 'She's living next door, sir.' 'Tell her to come over to Beechwood on New Year's Day, in the morning.' Mrs Saunders, who was not fit for much walking at the time, managed to get over, and happened to meet the archdeacon near the famous parish lime-tree. He told her he was going away. 'Why, where be ye going to, sir?' 'Well, I'm going to leave this parish, and going to Rome. I've tried to give everything away, but there's still something for you;' and he gave her a parting present. 'Whatever happens,' he said, 'you stick to your church as long as you live.' She made the promise, which she was able to keep for sixty-seven years, till she died the oldest parishioner in Lavington. 'Go up to the house,' he said; 'the housekeeper has something for you.' At that time (four years after the bursting of the railway bubble, two years after the year of revolutions, the Chartist demonstration in London, and the ravages of the cholera) the prices of ordinary provisions were very high, and the archdeacon used to get barrels of pickled pork for the relief of the needy. The housekeeper gave her as much pork as she could carry, for her husband and her various neighbours.

The parishes seem to have been well off for prosperous and open-hearted people, for, besides the archdeacon, Bishop Wilberforce, and Mr Laprimaundaye, there were Mr and Mrs Ladbroke, who were wealthy and kindly. Mr Ladbroke never walked out without a pocketful of coins, and when he met the children he used to throw them for a scramble. 'And there was a scramble, too,' said old Granny Saunders with a chuckle.

The archdeacon's departure caused great and genuine grief in the twin-parishes; but he was succeeded by one of the best of men, Mr Randall, who remained there some forty years, and afterwards became Dean of Bristol. His memory is also most affectionately cherished by his humble parishioners. Mrs Randall, who is still alive, was well off, and built the fine schools at Graffham. Mr Randall was not only an eloquent preacher and a sympathetic spiritual guide, but he was also a hearty, humorous, genial friend to all the people of the parish, and seemed to know instinctively when they were in distress and trouble. His harvest-homes were amongst the first held (the actual forerunners were those of Archdeacon Denison at East Brent). The whole parish attended; the church was carefully decorated; and long tables were spread on the lawn at Lavington for a festival tea afterwards, at which Bishop Samuel Wilberforce presided.

A local reminiscence of Bishop Wilberforce may be here recalled on the authority of the old rector of Hardham. Some time after Manning's bereavement, Wilberforce happened to be in Petworth, driving a high phaeton, with a pair of spirited and lately broken horses, alone, without a

groom. The number of gates between Lavington and Petworth was about twelve. The bishop, who, as all who knew him remember, was fond of a joke, suddenly spied little Bishop Trower, the retired Bishop of Gibraltar, walking along the road. He had a parish in the neighbourhood, and was short, stout, and very good-natured. 'Oh, my dear Trower,' cried the bishop, 'you're the very man I wanted to see. Our friend Manning is very lonely, and he much wants to have a talk with you.' Bishop Trower was much astonished, for he knew very little of Manning, and said so. 'You've no idea,' answered the bishop, 'how much good you'll do him, and how greatly he wishes to see you! I'll drive you over. Come, get up here!' Much mystified, Bishop Trower complied. He soon found out at any rate one reason why the bishop had been so eager for his company; for at each of the twelve gates he had to jump down, open it, and climb up again.

These times have long passed away, with all their associations, gay or grave. Manning became a great prince of the Church, who took a leading part in the Vatican Council, and whose distinguished career, as one of the most prominent ecclesiastics of the age, is a matter of history. His affection for the seventeen years of his life at Lavington never ceased, and the tradition of his pastoral influence, carried on by successive

rectors, is still a living force. Lavington Park also has passed from the Wilberforces to another proprietor, wealthy and benevolent, who has greatly enlarged the hillside home of the Gartons, Ormes, Betchworths, Sargents, and their successors, and made it a palace of art, richly stored with some of the best examples of modern British landscape and other paintings. He has built a library and village hall, and pleasant houses in the firwoods of Graffham. In one of them 'for some years was the hearth of one of the most truthful of living painters, Henry La Thangue, R.A., whose scenes of peasants at work (after the manner of Barbizon), and studies of sunlight spattering through trees, are among the triumphs of modern English art.\*

The sun still shines the same on the hills and uplands of Lavington and Graffham. The woods, the flowers, the streams, the birds, have the same charms as endeared them to Manning and Wilberforce; and their influence has not departed from the place. They loved the people, and worked strenuously to make them good and happy. The slight reminiscences here recorded, both the serious and the lighter, gathered from old and retentive memories, may perhaps be acceptable as illustrations of one side of the life and character of the two eminent brothers-in-law who were sincerely earnest in using their brilliant gifts in serving their day and generation.

## THE FORESTER'S GIRL

### CHAPTER III.—*continued.*

JUST then a series of shrill whistles issued from a short distance up the creek, followed by stern calls of "Bob"! "Bob"! *will* you come here!' And in another moment the hat and handsome face of Gavin Barrie appeared, one arm holding his rod high above the thronging boughs and bushes.

What the young man muttered beneath his breath, as brief as it was expressive, need not be recorded, when, on reaching the pool towards which, with a true fisherman's conscience, he had faithfully worked his way down all the dense and difficult part, he caught sight of the girl Lalonne in possession of the place, and already appropriated by his dog.

'Oh, Mr Barrie,' she cried with the perfect freedom of address that in some way annoyed him, 'your dog has treed a squirrel. I never saw one alive before. Do you think you could catch it for me?'

Supreme scorn swam through Barrie's being, but he managed to make at least a show of lifting his hat ere answering rather brusquely, 'Good Lord, no; I'm not a steeple-jack!'

Anita looked thoughtful. Did this Englishman mean to snub her? If so—a mysterious smile curved her red lips—she would give him

a surprise by-and-by. She said nothing further, but sat quiet, her hands clasped lightly around one knee to steady herself, her great dark eyes watching him as he deftly freed his line from a detaining bush.

Gavin Barrie was thoroughly put out, but it did not lie in his nature to be deliberately rude; so, sticking the end of his rod in the ground, and slipping the reel from his shoulder, he made a circuit of the log, and came up to where his dog, eyes glowing, red tongue lolling from wet jaws, still glared up at the squirrel.

'Silly beast!' said Gavin in make-believe reproach. 'And you know perfectly well you had no business to go rushing ahead, frightening every fish in the water!'

'Are they easily frightened?' asked Anita. Then, before Barrie could reply, she cried out, 'Oh, I see one!' and slipping lightly to the ground, darted to the edge of the stream.

What was the state of the man's feelings when he saw the girl, in her light-coloured blouse, bending over his treasured pool, none but a keen angler can understand. Smothering a curse, he gathered up reel and rod, and

\* E. V. Lucas, *Highways and Byways in Sussex*, p. 21.

made as though to move farther down the creek.

'Oh,' cried Anita, 'ain't you going to catch that fish? He's such a big one!'

Barrie's mouth gave its characteristic twist, but he succeeded in replying civilly, 'No use, I'm afraid; the water is thoroughly "frightened." I'll try my luck farther down.'

'But I don't understand,' protested the girl. 'The fish couldn't see me, and he went under that log. Do, please, try to catch him! I never saw anybody catch a fish.'

The lazily compliant side of Gavin's make-up rose to the surface. Why argue with this foolish girl? He would show her that the trout wasn't to be caught, and then perhaps he could go on and fish in peace. So, glancing about him to see that he could cast freely, he dropped a fly, delicately, beautifully—a sight to have delighted the eyes of Izaak Walton himself—under the shadowy log; and then—well, then the unexpected, that is the bait and yet the bane of an angler's vocation, happened; there was a smack and a flip of the running water, and then, swung dexterously free over her head and dropped at her feet, lay a beautiful, glittering, gleaming trout!

'Well, I'm blown!' burst from Barrie's surprised lips. 'He's a beauty, too! Wait a moment, and I'll take him off the fly; then you can see him better,' he went on, addressing Anita, the fisherman's satisfaction having put to flight his *mal humeur*.

Anita, kneeling on the ground, turned the fish over and over with one cautious finger, saying in unfeigned admiration, 'Isn't it lovely? I knew you could catch it. Won't you try again?' she asked, looking up at him with eyes of entreaty.

'I was mistaken once, so I may be a second time,' he answered; 'but I really don't think it's a particle of use. However'—and again the dainty fly swept the pool. Once—twice. Then, 'Stand back a bit, please, or you may get hooked!' he called to the girl; but, in her eagerness to watch him, she moved forward, and instantly the line, whipping backwards for a farther cast, caught the fly in the back of her muslin collar.

Poor Barrie's patience was being sorely tried. The last thing in the world which he wished to happen was the necessity for freeing that fly from the girl's dress.

'Don't touch it!' he cried to her, as she raised her arms behind her head to reach for the hook; then, laying down his rod, he came over to where she stood. 'Turn round,' he bade her in a tone between that of a father and a schoolmaster, then began extricating the hook, the while Anita remained motionless as a frozen rabbit, her shapely head drooping forward from the slender white neck, as though awaiting decapitation.

The hook was obstinate, and Gavin thoroughly hated the job; but to forfeit one of his best flies, especially when it was the very one the trout were taking, was not to be thought of, so he struggled to free it, until gradually the abnormal rigidity of the girl's attitude, by which she testified her contrition for thus wasting his precious time, roused his sense of humour.

'There!' he at last exclaimed. 'Sorry to have kept you so long; but it's out now. Hope it hasn't hurt this thing of yours;' and he just touched the lacy edge of the collar, somewhat disarranged about the base of her neck, where soft little fluffs of hair looked like tufts from a raven's breast against the whiteness of her skin.

Anita's hands fluttered up and about the collar, patting it into place; while Barrie, having satisfied himself that his precious fly was intact, fixed the leader into his reel and prepared to move on down the stream. A disturbing thought, however, that he was being rude persisted in making itself known, and swift retribution seemed to follow, for he could hear Anita's boots striking on the pebbly edges and her dress swishing against the bushes as she hurried after him.

'Oh, please wait for me!' she called a little breathlessly. 'I do so want to see you catch some more fish; and I promise not to frighten them again.'

The luckless angler felt himself to be fairly caught, with no possibility of wriggling off the hook! Had it been farther up-stream he might reasonably have urged upon his unwelcome *attachée* the peril to her frail clothing should she attempt to fight her way through the thickets, but from the point where they had met the creek broadened out, with banks fairly free, and enticing pools into which he could cast with comparative ease. Therefore, with the philosophic reflection that the Fates were plainly determined to spoil his morning, he answered carelessly, 'Oh, very well. And perhaps you could manage to keep "Bob" with you; he invariably rushes ahead and swims in the best pools.'

'Is "Bob" the name of your dog?' asked Anita, delighted to observe some symptoms of thaw on the part of this frigid young man; but the latter's laconic 'Yes' not encouraging further conversation, she coaxed the dog to her side and followed in his master's wake, unwontedly subdued and silent.

Such taciturnity would as a rule have depressed Anita Lalonne, whose tongue and temperament were alike of the lightning sort; but as she picked her way beside the merrily talkative stream, her hands and feet occupied in avoiding obstacles for which town streets had not educated them, and her eyes eagerly watching the graceful rise, fall, trail, of the Englishman's light line, the spell of the 'great silences' fell

upon her and filled some chamber of her heart hitherto empty.

This morning hour was for the girl a first stepping-stone across the stream of her future life with the forester, whose unsounded depths had, but a short while before, filled her with vague fears. Of all this, however, she herself was but dimly conscious, her mind for the time being alert to the novelty of environment, her blood quickened by the rarefied, pine-laden air and unaccustomed exercise.

As for Gavin Barrie, who, in the first feelings of vexation, had anticipated his quiet pleasure would be marred by the girl's presence, he found himself obliged grudgingly to admit that her office in keeping the marauding 'Bob' at a safe distance from his fishing-ground was an undeniable compensation. The trout, too, were in the best of humour for his flies; and was there ever an angler whose spirits could long resist the soothing influence of 'game' fish and a weighty 'basket'?

Presently the desire for sympathy, common to man and beast, getting the better of him, Gavin began, as one glittering trout after another rose to his deft fly, to throw a quick, backward glance at the girl, whose splendid eyes, lit up with excitement and admiration of his skill, unfailingly met his own, until by degrees, under the influence of sunshine and good sport, the prejudice which he had hastily conceived against her began to slip away. Thus for an hour or more the two trod the same trail, her trim little brown boots scrunching the same shining pebbles and pungent pine-needles as his heavy nail-studded foot-gear, a comfortable, if silent, camaraderie established between them, at once comprehended and approved by the red-brown dog.

Presently, however, this smooth-running order of things was rudely interrupted, and Gavin Barrie awakened to the difficulties of a situation for which he was in no degree responsible by the creek taking a sudden bend among dense-growing alders, making it necessary to cross. Almost doubling upon itself, the stream then flowed on between banks quite devoid of bush on one side, though impassably thick on the other. At this point, too, the water ran swift and fairly deep, racing along over a slippery bottom, with neither boulder nor fallen log to bridge it. Barrie came to a halt, his gray eyes quietly studying the position of things, thus allowing Anita, with a restraining finger in the dog's collar, to catch him up.

Presuming that he had stopped merely to examine his flies, she dropped down upon a convenient log, and heaving a sigh of happy content, said, glancing archly up at him, and mimicking Charlie Axel to the life, 'Ain't it awful nice!'

Gavin smiled appreciatively; then, after a moment's hesitation, said almost curtly, 'You

had better go back now. I shall have to cross here, and this side of the creek is impassable;' saying which, he took up his rod and began feeling about for the best footing and shallowest place to cross.

He had waded a few yards, when it occurred to him that perhaps Miss Lalonne could persuade his dog to go back with her—a relief to himself and company for her. Accordingly he turned about to make the request, and was amazed to see Anita standing ankle-deep in the water, her hands tightly clasped and her face deadly pale.

As her terrified eyes met his look of surprise, she broke out, 'Oh, Mr Barrie, please, please do not send me back!'

Barrie all at once felt very angry. What right had this strange girl to attach herself to him, forcing her company upon him and spoiling his sport? 'Go back at once!' he said sternly. 'Can't you see that it's impossible for you to come any farther?'

But the girl, heedless that her boots were being rapidly soaked, stirred not a step, but stretching out her hands, nearly electrified Barrie by exclaiming, '*Mais non, m'sieur! Ayez pitié de moi!* I cannot go back *toute seule*. I am terrified of the great forest and the m-m-mountain-lions!' Her voice broke and she burst into tears.

For an instant Gavin, his mind thus startled and groping after some elusive recollection, stared at the girl, then strode back to the edge of the stream, scattering the flying drops of water over her clothes.

'Then I suppose I must go back too,' he said brusquely, and, avoiding looking at Anita trembling beside him, began removing his flies.

Doubt and vexation boiling within him had nearly won the day, but your keen fisherman's instinct is indeed strong in death, and dies hard. The morning was heavenly, the trout taking well, a long stretch of tempting water still untried. Out with a jerk came Gavin's watch. Only ten o'clock. He succumbed to the inevitable.

'Take my rod. I'll carry you across,' he fairly snapped; and before Anita Lalonne could open her lips to speak, one iron arm had gripped her slender waist, the other swooped her up, and she found herself being borne across the water racing swiftly below her feet.

Clutching the rod in one hand, with the other she clung to the lapel of his coat, and as she felt his body sway and recover itself as he moved cautiously over the slippery stones, there flashed through her mind images from her strange dreams of the night before, in which this Englishman had figured, carrying, first, her lilies, then herself, then David. The strangeness of it all so obsessed her that when, very shortly, they gained the opposite bank and he

made as though to move farther down the creek.

'Oh,' cried Anita, 'ain't you going to catch that fish? He's such a big one!'

Barrie's mouth gave its characteristic twist, but he succeeded in replying civilly, 'No use, I'm afraid; the water is thoroughly "frightened." I'll try my luck farther down.'

'But I don't understand,' protested the girl. 'The fish couldn't see me, and he went under that log. Do, please, try to catch him! I never saw anybody catch a fish.'

The lazily compliant side of Gavin's make-up rose to the surface. Why argue with this foolish girl? He would show her that the trout wasn't to be caught, and then perhaps he could go on and fish in peace. So, glancing about him to see that he could cast freely, he dropped a fly, delicately, beautifully—a sight to have delighted the eyes of Izaak Walton himself—under the shadowy log; and then—well, then the unexpected, that is the bait and yet the bane of an angler's vocation, happened; there was a smack and a flip of the running water, and then, swung dexterously free over her head and dropped at her feet, lay a beautiful, glittering, gleaming trout!

'Well, I'm blowed!' burst from Barrie's surprised lips. 'He's a beauty, too! Wait a moment, and I'll take him off the fly; then you can see him better,' he went on, addressing Anita, the fisherman's satisfaction having put to flight his *mal humeur*.

Anita, kneeling on the ground, turned the fish over and over with one cautious finger, saying in unfeigned admiration, 'Isn't it lovely? I knew you could catch it. Won't you try again?' she asked, looking up at him with eyes of entreaty.

'I was mistaken once, so I may be a second time,' he answered; 'but I really don't think it's a particle of use. However'—and again the dainty fly swept the pool. Once—twice. Then, 'Stand back a bit, please, or you may get hooked!' he called to the girl; but, in her eagerness to watch him, she moved forward, and instantly the line, whipping backwards for a farther cast, caught the fly in the back of her muslin collar.

Poor Barrie's patience was being sorely tried. The last thing in the world which he wished to happen was the necessity for freeing that fly from the girl's dress.

'Don't touch it!' he cried to her, as she raised her arms behind her head to reach for the hook; then, laying down his rod, he came over to where she stood. 'Turn round,' he bade her in a tone between that of a father and a schoolmaster, then began extricating the hook, the while Anita remained motionless as a frozen rabbit, her shapely head drooping forward from the slender white neck, as though awaiting decapitation.

The hook was obstinate, and Gavin thoroughly hated the job; but to forfeit one of his best flies, especially when it was the very one the trout were taking, was not to be thought of, so he struggled to free it, until gradually the abnormal rigidity of the girl's attitude, by which she testified her contrition for thus wasting his precious time, roused his sense of humour.

'There!' he at last exclaimed. 'Sorry to have kept you so long; but it's out now. Hope it hasn't hurt this thing of yours;' and he just touched the lacy edge of the collar, somewhat disarranged about the base of her neck, where soft little fluffs of hair looked like tufts from a raven's breast against the whiteness of her skin.

Anita's hands fluttered up and about the collar, patting it into place; while Barrie, having satisfied himself that his precious fly was intact, fixed the leader into his reel and prepared to move on down the stream. A disturbing thought, however, that he was being rude persisted in making itself known, and swift retribution seemed to follow, for he could hear Anita's boots striking on the pebbly edges and her dress swishing against the bushes as she hurried after him.

'Oh, please wait for me!' she called a little breathlessly. 'I do so want to see you catch some more fish; and I promise not to frighten them again.'

The luckless angler felt himself to be fairly caught, with no possibility of wriggling off the hook! Had it been farther up-stream he might reasonably have urged upon his unwelcome *attachée* the peril to her frail clothing should she attempt to fight her way through the thickets, but from the point where they had met the creek broadened out, with banks fairly free, and enticing pools into which he could cast with comparative ease. Therefore, with the philosophic reflection that the Fates were plainly determined to spoil his morning, he answered carelessly, 'Oh, very well. And perhaps you could manage to keep "Bob" with you; he invariably rushes ahead and swims in the best pools.'

'Is "Bob" the name of your dog?' asked Anita, delighted to observe some symptoms of thaw on the part of this frigid young man; but the latter's laconic 'Yes' not encouraging further conversation, she coaxed the dog to her side and followed in his master's wake, unwontedly subdued and silent.

Such taciturnity would as a rule have depressed Anita Lalonne, whose tongue and temperament were alike of the lightning sort; but as she picked her way beside the merrily talkative stream, her hands and feet occupied in avoiding obstacles for which town streets had not educated them, and her eyes eagerly watching the graceful rise, fall, trail, of the Englishman's light line, the spell of the 'great silences' fell

upon her and filled some chamber of her heart hitherto empty.

This morning hour was for the girl a first stepping-stone across the stream of her future life with the forester, whose unsounded depths had, but a short while before, filled her with vague fears. Of all this, however, she herself was but dimly conscious, her mind for the time being alert to the novelty of environment, her blood quickened by the rarefied, pine-laden air and unaccustomed exercise.

As for Gavin Barrie, who, in the first feelings of vexation, had anticipated his quiet pleasure would be marred by the girl's presence, he found himself obliged grudgingly to admit that her office in keeping the marauding 'Bob' at a safe distance from his fishing-ground was an undeniable compensation. The trout, too, were in the best of humour for his flies; and was there ever an angler whose spirits could long resist the soothing influence of 'game' fish and a weighty 'basket'?

Presently the desire for sympathy, common to man and beast, getting the better of him, Gavin began, as one glittering trout after another rose to his deft fly, to throw a quick, backward glance at the girl, whose splendid eyes, lit up with excitement and admiration of his skill, unfailingly met his own, until by degrees, under the influence of sunshine and good sport, the prejudice which he had hastily conceived against her began to slip away. Thus for an hour or more the two trod the same trail, her trim little brown boots scrunching the same shining pebbles and pungent pine-needles as his heavy nail-studded foot-gear, a comfortable, if silent, camaraderie established between them, at once comprehended and approved by the red-brown dog.

Almost doubling upon itself, the stream then flowed on between banks quite devoid of bush on one side, though impassably thick on the other. At this point, too, the water ran swift and fairly deep, racing along over a slippery bottom, with neither boulder nor fallen log to bridge it. Barrie came to a halt, his gray eyes quietly studying the position of things, thus allowing Anita, with a restraining finger in the dog's collar, to catch him up.

Presuming that he had stopped merely to examine his flies, she dropped down upon a convenient log, and heaving a sigh of happy content, said, glancing archly up at him, and mimicking Charlie Axel to the life, 'Ain't it awful nice?'

Gavin smiled appreciatively; then, after a moment's hesitation, said almost curtly, 'You

had better go back now. I shall have to cross here, and this side of the creek is impassable;' saying which, he took up his rod and began feeling about for the best footing and shallowest place to cross.

He had waded a few yards, when it occurred to him that perhaps Miss Lalonne could persuade his dog to go back with her—a relief to himself and company for her. Accordingly he turned about to make the request, and was amazed to see Anita standing ankle-deep in the water, her hands tightly clasped and her face deadly pale.

As her terrified eyes met his look of surprise, she broke out, 'Oh, Mr Barrie, please, please do not send me back!'

Barrie all at once felt very angry. What right had this strange girl to attach herself to him, forcing her company upon him and spoiling his sport? 'Go back at once!' he said sternly. 'Can't you see that it's impossible for you to come any farther?'

But the girl, heedless that her boots were being rapidly soaked, stirred not a step, but stretching out her hands, nearly electrified Barrie by exclaiming, '*Mais non, monsieur! Ayez pitié de moi!* I cannot go back *toute seule*. I am terrified of the great forest and the m-m-mountain-lions!' Her voice broke and she burst into tears.

For an instant Gavin, his mind thus startled and groping after some elusive recollection, stared at the girl, then strode back to the edge of the stream, scattering the flying drops of water over her clothes.

'Then I suppose I must go back too,' he said brusquely, and, avoiding looking at Anita trembling beside him, began removing his flies.

Doubt and vexation boiling within him had nearly won the day, but your keen fisherman's instinct is indeed strong in death, and dies hard. The morning was heavenly, the trout taking well, a long stretch of tempting water still untried. Out with a jerk came Gavin's watch. Only ten o'clock. He succumbed to the inevitable.

'Take my rod. I'll carry you across,' he fairly snapped; and before Anita Lalonne could open her lips to speak, one iron arm had gripped her slender waist, the other swooped her up, and she found herself being borne across the water racing swiftly below her feet.

Clutching the rod in one hand, with the other she clung to the lapel of his coat, and as she felt his body sway and recover itself as he moved cautiously over the slippery stones, there flashed through her mind images from her strange dreams of the night before, in which this Englishman had figured, carrying, first, her lilies, then herself, then David. The strangeness of it all so obsessed her that when, very shortly, they gained the opposite bank and he

set her down, she could find no words to thank him; while he, the unwelcome act of gallantry performed, took without a word the rod from her hand, and began searching his fly-book for fresh allurements. Had the man not been too thoroughly put out by the turn of events, and the girl too miserable at being treated like a naughty child, the humour of the situation must have struck them both. As it was, things were at a very uncomfortable tension, when the red-brown dog, temporarily forgotten, came to the rescue by putting in an appearance, now swimming, now grotesquely wading, across the creek, while proudly aloft was held a fine gray squirrel, its bushy tail sadly bedraggled in the water. This prize 'Bob,' having reached the bank and thoroughly shaken his curly coat all over Anita's clothing, proceeded to lay at her feet, the while wagging his tail and glancing quasi-apologetically at his master.

Up raced the mercury in Anita's thermometer; the warm colour again flooded her cheeks, her eyes danced, as she cried, 'Thank you, "Bob." Good dog!—See, Mr Barrie, what a lovely squirrel he has brought me—quite dead, *pauvre p'tit!*' she ended, gently stroking the soft gray fur, and feeling the wonderful, nimble feet.

Barrie, of course, went to look, and as he bent over the girl, crouching with the squirrel in her lap, he said hurriedly and flushing red, 'I'm afraid you must think me not half so polite as my dog; but I really didn't mean to be so surly.' Then, forestalling any reply, he added, 'I'll put the squirrel in a bush, and we can get it on our way back—that is, if you care to have the skin.'

'Yes, indeed I should,' Anita replied, her town-trained mind at once reverting to the fancy prices paid for squirrel-fur and how smart it was, yet puzzled as to how it could arrive at the condition in which it appeared in shops.

She would have liked to question Barrie as to this, but he was already some distance ahead of her, intent upon his sport; so she followed slowly along, faithfully luring 'Bob' away from the water, while she filled her hands with ferns and such flowers as had escaped from the gloom and poison of the tall-pines into the sunshine and moisture offered by the open spaces beside the creek.

The Fates, however, were minded completely to muddle Gavin Barrie's morning. Hardly was his line well wet but all sorts of disquieting thoughts began to distract him and take away the zest of his sport. The various delays had sapped his time. It suddenly occurred to him that the stream must be recrossed, and as the girl could not walk so fast as he, they must soon retrace their steps or arrive at the station late for that impossible midday meal. For himself, he would gladly have gone without, but with this girl on his hands it wasn't to be thought of. His fine sense of direction, which elsewhere

during his wide ramblings had served him in many a doubtful place, now assured him that a cross-cut through the woods would lead into the open road back to the Grizzly; yet here again he was balked by the impossibility of taking Miss Lalonne through the dense, fatiguing forest. Also, there rose up to torment him a haunting remembrance of his mother's horror of wet feet for his sisters, and this girl's boots were soaking. He felt half-inclined to 'chuck' the thing and go back at once; but just then, catching sight of an irresistible bit of water around the bend in the creek, he came to a sudden decision.

Waiting until Anita overtook him, he said, 'It's nearly time to be returning, but I should very much like to try this next stretch of water, and could fish along pretty fast if you would wait here. Could you manage to keep "Bob" with you, please?' Anita stopped short. He could see her fingers digging nervously into the palms of her hands, her cheeks paling, her eyes filling with terror as she glanced apprehensively about her; but she said not a word. Barrie, sorely tried, and utterly unable to understand the girl's fears, faced her resolutely, and said in a voice wherein vexation and patience strove for the mastery, 'Miss Lalonne, there is absolutely nothing to be afraid of. Won't you believe me?'

'Yes,' answered Anita faintly, and turned her head quickly lest he should see the tears welling in her eyes.

Then, as he moved rapidly away, she seated herself on a mossy mound, her back against a great boulder, with one arm encircling the red-brown dog, who promptly settled himself to sleep, evidently satisfied that all troublesome details had been arranged without any worry on his part. So long as the tall figure of the fisherman was in sight Anita sat erect, lest, looking back, he should discover how fast her courage was ebbing; but when the last bit of his coat vanished among the bushes, and not even the thin, shimmering line of his cast was visible, she buried her face in her hands, her heart thumping wildly. If she could but shut out from view this vast forest, with its sombre shadows and massed battalions of dusky trees, its mighty prostrate trunks, behind which her imagination fancied all sorts of wild beasts might lurk, then perhaps she could endure the awful solitude until her companion should return. Why—why, she asked herself, had she attempted to follow him? What would David say if he could see her at this moment? Nay, more; what would he think of a man who would or could leave her alone in this wild spot? Torturing herself with thoughts like these, she presently burst into such anguished sobs that the red-brown dog, roused from his comfortable slumber, whined and licked her fingers, through which tears trickled fast.

At length the silent sympathy of the dumb beast recalled to her mind the words of his master: 'There's nothing to be afraid of. Won't you believe me?' And wholly unbidden seemed to come the answer from her heart: 'Yes; you can believe him.' Hastily, lest, returning, he should find her in tears, Anita dried her eyes; then, overcome with weariness, slipped down comfortably beside the dog, pillowing her head upon the moss, and forcing herself to look unflinchingly into the tangled maze of tree and bush around her.

Now the Great Musician has a wonderful way of soothing the fretted nerves of His children if they will but listen, and presently each member of His forest orchestra began to play its part in a grand symphony. High above the head of the weary girl a crested woodpecker began beating his drum—rat-tat-tat, rat-tat-tat—among pine-boughs, weaving soft melodies with muted strings; the flowing stream, a few yards distant, with master-touch awoke the music of a hundred instruments, pitched high, pitched low, some tinkling and silvery, some deep and sonorous; while from within the bay of Anita's encircling arm the long-drawn,

regular snores of Gavin Barrie's dog were to the rest of the band as the drone to the bagpipes. The summer air, laden with the breath of balsams, was sweet. Anita Lalonne was weary.

With the nutty fragrance of a newly lighted pipe in her nostrils, and a consciousness of void where her four-footed companion had nestled, Anita woke with a start, sprang upright from her woodland couch, one rounded cheek crimson from the pressure, her dark eyes wide and startled, and discovered Gavin Barrie a few paces from her, counting into his grass-lined creel a pile of bright-hued fish, the red-brown dog as an interested spectator.

'Well,' he said pleasantly as their eyes met, 'I began to think it would be a case of raw fish for dinner, no "goat" forthcoming in the wilderness even for "Bob."' Then, as Anita, with the primitive instinct of the female, began patting and smoothing her slightly dishevelled person, he added, half-questioning, 'You weren't afraid this time?'

'Oh no!' lied Anita courageously. Thus—a second stepping-stone.

(Continued on page 68.)

## SPANISH HUSTLERS.

By BART KENNEDY.

**Y**OU will find them in Saragossa. They can hold their own with the classic hustlers of Chicago. How they come to be born and bred in such a country as Spain beats me. Spain is supposed to be a kind of Lotus-land. It is supposed to be a place where the inhabitants are too polite to seize with rudeness the forelock of old Father Time.

When I arrived in Saragossa I was—at the outset—much alarmed. The swift hustling, and jumping, and running around of the Saragossans made me feel giddy. At first I thought I was in the middle of a weird dream. And on several occasions I pinched myself to find out if I were really awake.

I had made my way—or, rather, tramped my way—from Madrid. I had padded the hoof through mountain-chains and across the great plain of Castile. Before that I had been taking my ease down in Andalusia—good old Andalusia, where nobody will ever do anything till the morrow, and won't do it even then. (A bull, but expresses exactly the attitude.)

I was now amongst the hustlers. And I felt for myself a deep sympathy. To be reminded of Chicago in classic, medieval Spain was an outrage upon my artistic sense.

I stopped at an hotel with a very long name. The name I will not disclose for certain reasons. Everything in it went on in a slap-bang, knock-'em-down-and-drag-'em-out style. The chamber-

maids—if I may so put it—were of the male persuasion. They were swift young men—lightning acrobats. Two of them made the bed in the room to which I was assigned whilst I was standing at the door, wondering if I were awake. Never have I witnessed so sudden a performance. The movements of their hands were too quick for my eyes to follow. I could just see the bed transforming itself. No more. After the bed was made, they tidied up. During this process one of them let the water-jug drop. It was broken into several pieces. But it turned out to be all right in the end—as far as the hotel was concerned. It was charged up to me in my bill!

I may remark that I had been up through the whole of the night before. I had entered the town in the small hours in company with a *sereno*—a watchman armed with a lance. Though his desire in the beginning was to prod me with this lance, he turned out eventually to be a polite character. He it was who steered me to the hotel. It was with the greatest difficulty that I induced him to take a peseta as a tip. He was a good fellow, that *sereno*. Somewhat inclined to be interesting at the outset, but all right when you got to know him.

When I sat down to get a much-needed meal in the hotel I had another vivid time. The waiters were not waiters. They were simply

swift, hash-slinging jugglers. They threw things about in a disturbing manner. Their aim was good, but I shuddered to think of what might happen if the particular juggler who was looking after me were to swerve from his form as a perfect aimer.

How they scooted around the dining-room! As I looked wonderingly at them I thought of the waiters down in Granada in dear old Andalusia. They were indeed waiters. And there was another thing about them, too. They turned you, the dine-ee, or the breakfast-ee, into a waiter also. Occasionally they forgot to bring you food. But I preferred them very much to these hash-slinging, scooting jugglers. They fitted more properly into the picture of Spain.

After breakfast it occurred to me that a little repose might do me good. I had been up—as I remarked—through the whole of the night before.

I went to the room where the disaster had happened to the jug. Here I got to bed and tried to sleep. I conjured up visions of very far-away Andalusia. Useless. I was unable to lose myself in sleep. The hotel was a kind of go-round in which there was no merriment. Noise, noise, and again noise. Everything seemed to be on the scoot and hop and jump. There was rest in this place neither for the weary nor the wicked. At last I got up.

Soon I found myself out in the street, going towards the Puente de Piedra (Bridge of Stone). It was a great, fine bridge of many arches. People of all shapes and sizes and kinds were going over it. There came to me a vague idea to the effect that if I were to go over it I might find some place in Saragossa where calmness and quietude reigned. But two policemen, who were at the entrance to the bridge, would not allow me to pass. Why, I don't know.

I went back up towards the Plaza de la Constitucion. When I got to the Calle del Coso, I was halted by a crowd of people who were actually standing still. I was struck with wonder. But there was a good reason for it. A procession was passing. A *fiesta* was being held. The procession was the oddest I ever saw. Gigantic figures were going along with immense heads. And around them were dancing curiously dressed people.

In the Plaza de la Constitucion things were going with a whoop. It was full of all sorts of people doing all sorts of things. Energy and noise and disquiet were everywhere. The picture of Granada came up vividly before me—Granada, that now seemed so far, far away—that was almost as if it were in another planet. I had been for more than two months in that delightful town of Andalusia, and during the whole of that time I had practically never seen any one doing anything. It was indeed a town of rest. I sighed as I thought of it here in the

Plaza de la Constitucion. And I sighed again, and again.

A regiment of soldiers came through the plaza. They did not look quite so restless and alive as did the civilians. They needed a rest, for they looked tired. They had come, perhaps, from off a long march. At the head of the regiment a band was playing.

I have no desire to be rude, but frankly that band was not a band of the best. It was uncertain as to key, and wobbly as to time. Its component parts—or instruments—were in a state of constant disagreement. It was something after the brand of the old German bands I used to hear playing in the streets in the north of England when I was a lad.

After looking at the soldiers, and trying not to listen to the band, I went over to the Post-Office. Why I went I have no idea. I just ambled aimlessly over.

Here everything was going with the utmost swiftness and celerity and despatch. Every one was doing three or four things at once. I looked at them, and as I looked I pondered. These Catalonians were not even distantly related to the people of the south of Spain!

Suddenly I felt that an eye was upon me. I turned round and met it. It was a hard eye, and it was gleaming from out a hard, fierce face. Its lawful possessor and owner was a tall, powerful-looking fellow who wore the air of a brigand out on a holiday. I must remark that his looks did not fascinate me.

I gazed at him with a gaze that as much as said, 'Take your eye off; I don't want it.'

After glaring at me for a while he addressed me in the rough, guttural Catalan dialect. I couldn't make out his meaning with any clearness, but I gathered that the burden of his song was to the effect that I had no particular right to be in Saragossa—in fact, that I had no particular right to be cumbering the earth generally.

I talked back to him in harsh-sounding English. He did not understand the words, but he knew what I meant. The language of defiance is a language that is comprehended by all.

It was not my intention to fight with this out-for-a-holiday brigand. It is never tactful to get mixed up in a fight in a foreign land. If you win, you get the worst of it from the law. But you don't win usually. The onlookers are apt to be unneutral. I know, for I have had some.

Still, at the same time, it is a bad policy to put up with aggression. The meek and lowly may inherit eventually the Kingdom of Heaven, but they don't inherit much here on this earth below. Fighting is the most effective of all defences.

Just as we were about to collide in combat, there occurred a diversion. A beautiful woman

came up and began to speak to the brigandish-looking Saragossan. She seemed, as it were, to drop from nowhere in particular. I had not seen her approach, for I had kept my eye on the eye of the ferocious person.

And there was a change. His face took on a look of milk-like mildness. He took off his hat, displaying his very low forehead as he did so. The change in him now was most remarkable. His manner was the manner of one who eats from the hand.

The crisis was over. I departed, for, whilst it does not do to shirk a fight, at the same time it is not advisable to look for one.

I found my way back to the hotel with the long name. Here I got into conversation with a cavalry officer. Though he had the swift Saragossan style, he was a nice fellow nevertheless.

We endeavoured to tell each other many things. But I fear that our conversation was marked by diplomacy rather than clearness. I had no idea of what he was saying at all. But I listened to him with an air of perfect comprehension. He did the same thing by me. I was endeavouring to tell him, by the aid of gestures and odd words of Spanish, of the bull-fights I had witnessed in Madrid and Seville. He seemed to be profoundly interested. Perhaps he was.

We wound up, however, with the discussion together of a bottle of Rioja. This discussion was more to the point.

That night I went to a theatre. A comedy of some kind was being given.

It must have been a very funny comedy, for everybody roared with laughter. I didn't roar—if I may so express it—for I could find nothing

to roar about. I couldn't follow the thread of what was going on.

There are a good many depressing things on this earth, and sitting through a comedy that is being given in a language you don't understand is one of them. A great laugh goes through the theatre, and there you sit glum as an undertaker. Laughter as a rule begets laughter. But it doesn't beget it in this particular case. You haven't the key to anything. Even if the action on the stage is funny, you miss the point through not being able to follow the thread of what is going on.

All this happened to me. It would have been better if I had stayed at the hotel and indulged in a diplomatic conversation with the cavalry officer. I stayed on till the end of the show, hoping that I might be able to laugh. But no. I was laugh-bound.

I was once more in the hotel dining-room. Things around me were going vividly. Supper was on, and the swift, hash-slinging jugglers were performing wondrous feats with food and plates and knives and forks. Everything was on the hop and jump. Everything was on the hurry and hustle. To my eyes it seemed almost as if the chairs and tables and other objects—usually inanimate—had joined in the universal scurry.

That night I slept the sleep of the tired and the just. And the next morning I was out on the road, with my knapsack on my back, tramping towards the north-east. I was leaving the town of the Spanish hustlers—the Spanish Chicago—behind me.

I was not sorry.

## 'No. 13.'

### PART II.

WE returned to Seville the same day, and by that time I had quite made up my mind how to act regarding Don Andrés. As I said before, what was done was done. Nothing could change that. Next day, therefore, when in the office, I said, 'Don Andrés, do you know the story of the mouse and the lion? I feel myself somewhat like the mouse. You may think it forward of me to give you any hints in your business, but lookers-on sometimes see what those playing a game miss. Now, the other day, when I was over at San Bartolomé, I saw in the *almacen* of Señor Paderna some of the finest oil I ever tasted. You have, evidently, missed this. No doubt you have your own favourites among the growers; but if you take a hint from one who, of course, knows much less than you do about the business, you will have a look at what he can show you. You are

not offended with me, I hope, for speaking like this?'

'Indeed,' said Don Andrés, 'far from being offended, I am very grateful to you for your kindness, and I will lose no time in inspecting Paderna's stock.'

I had spent the best part of a month in Seville before an opportunity offered of leaving for Malaga. In those days there were only two lines of railway from Seville—one to Cordova in the north, and that to Cadiz in the south; and I had, therefore, to wait for a steamer, unless I chose to spend a week cooped up in an asphyxiating *diligence*. So, in the beginning of July, I secured a passage on a small coasting-steamer, and arrived in Malaga on the eighth of the month. I had really no business to transact there, my only object being to pay a few visits to the houses of our correspondents. A few days

sufficed for this, and having again embarked on the same steamer, I reached Valencia at the end of the month, having called on the way at Almería, Cartagena, and Alicante.

We had a very considerable trade with Valencia. I put up at a very good hotel in the city, and had several invitations to dinners and *tertulias*, or evening-parties, from our friends, but I met with no such unreserved welcome as I had experienced in Seville at the hands of Don Andrés Toreno and his family; and I rejoiced daily more and more that I had thought of a way out of what at one time seemed to me a hopeless impasse.

Indeed, more than that, I felt that I had secured a friend. When I was taking leave of him at Seville, Don Andrés had said to me, 'Don Frederico, you know our Spanish custom of putting all our belongings at the disposal of our guests. Well, generally that is an empty compliment; but if ever you want a friend, or if anything should ever occur in which I can help you, ask it of me, with the certainty that, if it be in my power, you will not be refused.'

I had written many letters to my father, giving account of my various visits; but regarding the oil question, I had only said that Señor Toreno had promised to exercise special care as to future shipments, and that I was quite satisfied that we should find a great improvement in our dealings with Seville.

I remained at Valencia for the best part of a month, when I again turned south, and called at Alicante, where I passed a week. While there I had a letter from Don Andrés, in which he told of the engagement of one of his daughters. Somehow, until I came to the end of the paragraph which cleared the matter up, I experienced an uneasy feeling which I found it difficult to explain. The letter went on to say: 'You will remember Julian Alvarez, whom you met at your\* house in Seville. Well, he has asked us for the hand of our daughter Mercedes, and they are to be married in September. We all hope that you will be with us then.'

I had, I must say, been very much charmed with Candidad Toreno, and, somehow, the fact that it was not she who was engaged seemed a relief to me.

I returned to Seville at the end of August, and on going out to Alcalá found them all occupied with preparations for the approaching wedding, which was to take place on the last day of September. My intention was to remain till after the ceremony, and go on to Madrid, as, I said to myself, it might be a long time before an opportunity of visiting the capital should again offer.

As I had no further business in Seville, I

spent all my time at Alcalá, and most of it in Candidad's company. I soon realised why it was that the announcement by Don Andrés of the engagement of 'one of his daughters' had caused me such a flutter, and long before the end of September I found that the interests of Widgers & Cripplebury had assumed only a secondary place in my thoughts.

Since my coming to Spain the delight which I took in the country was only the natural development of the feelings with which I had always looked forward to some day visiting the land of Don Quixote and Gil Blas. As I said before, I had worked hard at acquiring a very good knowledge of the language, and I had read a good deal of Spanish literature. And so, when I arrived in the country itself, I was quite at home; and this feeling had been daily accentuated by my intercourse with the people. The unvarying courtesy of even the most uneducated among Spaniards is wonderful. I met with a very remarkable instance of this—even in what might be called an heroic degree—during my stay at Alcalá.

I was most anxious to pay a visit to Santiponce—the *Italica* of the Romans—to see the famous aqueduct and the many other relics of Roman times. I drove over from Alcalá to Triana, and walked the remaining couple of miles. Having spent a few hours sight-seeing, I started to return to Triana, where I proposed having some refreshment before driving back to Alcalá. Just outside the village of Santiponce I met a shepherd, with whom I had a few minutes' chat. He told me that my most direct course would be to walk through the pine-forest which ended some half-mile to the west of Triana.

Unfortunately I left the badly marked foot-path, and soon found myself hopelessly lost. I had no landmark to guide me, and had got into a part of the wood where the thickness of the growth and the slippery foothold of the pine-needles on the ground rendered progress both slow and tiring. I became seriously alarmed. I had entered the wood at four o'clock, and it was now eight. The short twilight had been succeeded by almost absolute darkness. I thought at one time of giving up the struggle, and lying down for the night among the trees; but, somehow, the awful darkness and solitude terrified me, and after resting for a couple of hours—for I was completely exhausted—I resumed my slow progress. I was lucky in having a box of matches, so that I could know the time, if that was any comfort.

It was one o'clock the last time I had looked, and about ten minutes after I saw what seemed to be the light of a fire some distance in front. I made for it with much difficulty through the thick growth, and in another hour came to a clearing, where I saw a rather large wooden hut and several piles of smouldering wood. I knew

\* A delicate Spanish compliment implying that his house was mine.

at once that I had struck the encampment of some charcoal-burners.

I had evidently been heard by the occupants of the hut, for at my approach a man appeared in the opening and called out, 'Who goes there?'

'A friend,' I replied, and told him of my dilemma, and of the state of exhaustion and semi-starvation in which I was. He at once invited me into the hut. Inside there were three other men, sleeping on the floor, their beds apparently of pine-needles covered with a rug. My host invited me to sit by the brazier, for the night air was very cold, while he prepared some food. The resources of their larder were apparently limited, but the supper of excellent bread and tomatoes fried in oil seemed to me food fit for the gods, and the rough wine of the district, with which it was washed down, a nectar worthy of accompanying the viands. I have many times since then partaken of costly meals, but never have I experienced the delight of satiety as I did that night in the charcoal-burners' hut.

While I supped, my host told me that I had, after all my wanderings, doubled back, and that I was then nearly as far from Triana as when I entered the wood at four o'clock the previous afternoon. He then prepared my bed of pine-needles, and, covered with a couple of rugs, I slept till ten o'clock in the morning.

When I awoke I was alone in the hut; but I found the men outside at their work, and my host of the night would not hear of my leaving without breakfast. It was not much—bread and garlic soup—but it was all they had to give.

On taking leave of my newly made friends I offered some money, at the same time saying that my debt was one which money could not pay; but I was met with the remark, '*Señorito, no somos Moros*' ('Young sir, we are not Moors'), as the speaker waved aside the proffered coin. I therefore presented him with a few cigars, which he accepted courteously, as one gentleman might from another. Truly he was, as the Spaniards say, '*tan hidalgo como el rey*' ('as much a gentleman as the king').

The wedding of Mercedes Toreno and Julian Alvarez took place, as arranged, on the last day of September, and the newly married pair left for Cordova, where they were to spend their honeymoon. My visit had, therefore, come to an end.

Among the wedding guests we had had, for the past few weeks, a brother of Doña Maria, who held a good position in the War Office at Madrid—Don Francisco Davila. He was quite a young man for the rank he held—not more than thirty-eight or forty years of age. He had become exceedingly friendly with me during his stay, and I had a strong suspicion that

he understood my feelings towards his niece. But neither to him nor indeed to Candidad herself had I said anything likely to betray the hopelessness with which I looked forward to my departure. I was entirely dependent on my father. I had not even a share in his business, and absolutely no means of supporting a wife.

My father was a Protestant, but my mother came of an old Lancashire Catholic family, and my sisters and I—I was an only son—had been brought up in the Catholic faith, so that there was at least no objection on account of a disparity of religious belief; but this was a poor set-off against my shortcomings as a suitor. Altogether I was very despondent as the day drew near on which I was to leave Alcalá and go on to Madrid with Don Francisco, at whose house I had been invited to stay for the short time I proposed to spend in the capital before returning to England.

On the eve of my departure I was walking in the garden with Candidad, talking of the very pleasant time I had had since my arrival at Seville.

'And now,' I said, 'it is all over, and I go back to foggy London to console myself as best I may with my recollections of sunny Spain, and the happy time I have spent here. I am often inclined to wish I had never come.'

'Ah, do not say that! Surely you do not regret having made so many new friends! As for myself, I am very glad indeed that you did come; and now that you have got to like Spain, and, I hope, the Spaniards too, we look on it as quite a settled thing that you will repeat your visit next year, and we shall all be looking forward to your return.'

'Ah, Doña Candidad,' I said, 'so many things may happen before next year! What if I should return and miss some of the friends that I hope I have made here?'

'There now, you are again taking the gloomy view of everything. So far as we are concerned, I think I can safely prophesy that no change will have occurred.'

'If indeed I could be sure,' I said, 'I should leave with a light heart.'

'Well, then, be sure,' she said; and we went into the house.

I left next morning with Don Francisco Davila, and remained with him for ten days in Madrid. He showed me all the 'lions' of the capital, and I must say I enjoyed myself more than I should have done had I not had the little chat with Candidad which I have related above.

On the eve of my departure we were walking through the Puerta del Sol, when Don Francisco said, 'Well, Don Frederico, I think you have seen all that we have to show you—the vineyards, and theatres, and bull-fights, and what not. Nothing now remains but that you

should have an interest in the big Christmas lottery of the 23rd of December, and then you will have served your apprenticeship, and become as nearly a true Spaniard as you can hope to be.'

'By all means,' I said, 'let us leave nothing undone to bring about such a desirable result.'

'Well, come along; we are just close to one of the lottery administrations. But, by the way, perhaps you may prefer that we should go to another, as this happens to be No. 13?'

'On the contrary,' I said, 'I look on it as a good omen. This is the 13th of October—quite a remarkable coincidence.'

We went into the office, of which a lady was in charge, and Don Francisco said, 'I suppose one-tenth of a ticket will suffice? This being a very big drawing, the price of the tickets is high. A whole ticket would cost forty pounds, English money, or, rather, thirty-six, as the rate of exchange is in your favour. A tenth of a ticket would be, of course, only a tenth of that, and even with a tenth you stand a chance of winning more than twenty thousand pounds.'

'I fear, gentlemen,' said the lady in charge, 'that I must ask you to wait a few moments. There has been a great run on tickets, and

I have sent up to the Treasury for a fresh supply. As a matter of fact, I have only one ticket left, No. 13, which, of course, no one would buy'—

'That settles it,' I said; 'the chain is complete. I will take the whole ticket, if you please.'

I paid my money and got my ticket, Don Francisco remarking, 'Well, you certainly have courage.'

I was back in London by the end of October, and my father was well pleased with the account I gave of my travels. I must confess I was not so eager about my work as before I paid my visit to Spain. But though my mind was a good deal unsettled, I found some consolation in the hope of a return thither during the coming year. Indeed, I think I had made up my mind that nothing should prevent that.

I told my mother all my secrets, and she gave me much courage, which I needed badly.

'Faint heart,' you know, Fred,' she said. 'But indeed I think, though nothing definite was said—indeed, I don't see what the young lady *could* say, unless she proposed to you outright—you may trust Candidad, and I will see that you get away again next year; so keep a good heart.'

(Continued on page 72.)

## ALEXIS SOYER: POET, PERSONALITY, AND COOK

By Mrs F. A. DOUGLAS.

THE gourmet is born, not made. He is, in his way, an artist. A new sauce is to him what his picture is to the artist, his latest verse to the poet, his newest harmony to the musician.

Alexis Soyer was at once a gourmet and a cook. Born appropriately enough in a little town called Meaux-en-Brie, famous for its cheese, he became at seventeen head cook in a famous Paris restaurant, and director of twelve assistants. He had essentially the nature of an artist. When he was a child, his voice and musical talent caused him to be chosen as a chorister, and his parents dreamed of making him a priest. But the artist is ever a rebel, and Alexis at eleven achieved emancipation by the simple method of getting up in the middle of the night and ringing a fire-bell. Such conduct was obviously unworthy of an embryo priest, and Alexis was ejected from ecclesiastical circles, and declining 'on a lower range of feelings,' followed in an elder brother's footsteps, and became a cook.

Once a cook, not of necessity always a cook. At intervals the artist soul in Alexis burned fiercely. In spite of his rapid rise in his profession, Alexis longed to leave it and go on the stage. Not only was he a good musician, but also an excellent mimic. The cook being a person of consideration in France, Alexis was

sometimes called upon to entertain the company for whom he had cooked. One brave night, having cooked, having drunk, having sung, and been feasted at his employer's expense, he had, like Cinderella when the ball was over, to return to his kitchen, and did so, bearing on his head a wooden tray with things hired out by the restaurateur. What did Alexis do? His head was light and his heels were heavy, and at last, mistaking a shed for home, he went in there, put down his tray, divested himself of certain important garments, and went to sleep!

It was a series of jovial nights like these that first roused the creative poetic impulse in Alexis, and he wrote a *chansonnette*, beginning:

Les cafés se garnissent de gourmands, de fumeurs,  
Les théâtres se remplissent de joyeux spectateurs,  
Les passages fourmillent de badauds d'amateurs,  
Et les filous frétille derrière les flâneurs.

The poem does not exactly betray genius, nor do we care to quote it further; but, as Dr Johnson said of the dogs that danced, it is not surprising that he did it well, but only that he did it at all.

It was as a cook, however, that Alexis was preordained to eminence. In June 1830 he became second cook at the Foreign Office, but

in July the Revolution upset everything, and he had to fly to London.

It was characteristic of the day that this Revolution affected even the Government kitchen. Happy in their work, the cooks were busy preparing for an entertainment to the Prince Polignac, when armed men burst into the kitchen, and, as Alexis tragically said, 'Toutes ces somptueuses préparations furent doublement consommées par eux.' Two of these humble culinary artists were shot, and such, too, might have been Alexis's fate had not a brilliant inspiration induced him to sing the *Marseillaise*. Saved and secure, Alexis rushed into verse once more, and *Le Patriote Mécontent* achieved popularity:

C'est tout de même embêtant  
J'maronne quand j'y pense,  
D'voir tant de Schnapans  
Se faire valoir à mes dépens.

What France lost, England gained. Alexis was twenty-two when he came to London, and he and his brother cooked successively for the Duke of Cambridge, the Duke of Sutherland, the Marquis of Waterford, and Mr Lloyd of Ash Hall, Oswestry. At Oswestry he was in high favour. He cooked; he sang; he even hunted. But the soul of the artist was ever working in him, and after five years of gay living in Shropshire, he passed to the service of the Marquis of Ailsa in Isleworth—a genuine gourmet.

Art led on to love, and Alexis fell a victim to Cupid's bow. He sat for his portrait to a fair painter, and fell in love with her. Her people objected to her marrying a 'cook,' but to his loftier mind all artists were equal, and Alexis Soyer and Emma Jones were married at St George's, Hanover Square, on the 12th April 1837, on the same day as the Marquis of Douro, the eldest son of the Duke of Wellington. M. Ude, another celestial cook, presided over Soyer's wedding-banquet.

Alexis, as became a poet and an artist, wrote verses to his love, beginning:

O vous, Emma, O vous, que mon cœur aime,  
Enfant gâté d'Apollon et des arts.

And he continues:

Les dieux prodigues ont sur votre carrière  
Semé les fleurs du plus riant printemps,  
Qui ne puisse d'immortelles ou de lierre  
Couronner un aussi beau talent.

Soon after his marriage Soyer attained to his highest glory as cook of the Reform Club, and on the day of Queen Victoria's coronation he served up dinner to two thousand.

Great was the glory of Soyer's kitchen at the Reform Club. He was an admirable organiser. His fireplace for roasting held three hundredweight of coal at a time. Vegetables were cooked on French charcoal stoves, and his fish reposed under the stair, with a perpetual stream of iced water flowing round them. It would have been very interesting to study M. Soyer's herb-closet, &c.,

for the greatness of the cook is shown in the diversity of his materials.

M. Ude, Soyer's friend and brother-cook, lacked Alexis's literary gifts. Once upon a time M. Ude had a birthday, and this is the invitation he sent to Alexis:

'LONDON, Aug. 21, 1841.

'DEAR SIR,—You will oblige me to favour with your company, you and your wife, on Wednesday next at  $\frac{1}{2}$  past five o'clock, been my birthday.'

M. Ude was cook at Crockford's. Although not gifted with pen or tongue or voice, M. Ude had at least the steadfast heart of a collector, and the rarest china and fine gold and silver plate graced his birthday table. He was also a dog, cat, and parrot lover, and M. Soyer's biographer gives a very humorous account of his birthday feast. Dogs delighted to bark and bite, precious china was broken, M. Ude betrayed the impetuous temper of a Bohemian, and it required all M. Soyer's diplomatic skill to save the party from disaster.

But Alexis Soyer was not only poet, personality, and cook; he was also statesman, philanthropist, and humorist.

Soyer's chief service to his adopted country was the organisation of the cooking for the troops in the Crimea. A letter sent to the *Times* by Mr William Howard Russell called his attention to the deplorable culinary arrangements for the army, and his gallant soul was filled with wrath and grief. He at once wrote to the *Times* himself. It was in 1855, and he was forty-six years old, and a personage of note in London. 'I propose,' he says, 'offering my services gratuitously, and proceeding direct to Scutari at my own personal expense to regulate that important department, if the Government will honour me with their confidence, and grant me the full power of acting according to my knowledge and experience in such matters.' The Government was delighted, and the Duchess of Sutherland of the day asked M. Soyer to call specially at Stafford House and talk the matter over with her.

Soyer went first to the hospitals in Scutari. Sickness at that time was carrying off patients at the rate of one hundred a day, and so busy was everybody that there was no time for individual burial, all the deceased being rolled up and interred in one common pit. It made the susceptible Soyer ill himself, but, in spite of violent nausea and diarrhoea, he set to work at once to regulate and improve the dietary. At one barrack hospital he set up a model kitchen, where all might come and learn.

From the hospitals he went to the front, and there instituted field kitchens with a special 'field stove' of his own. On his way home, Napoleon III. summoned Soyer to the Tuileries, and was so delighted with the field stove that he ordered one, and had it set up in his palace. At Constantinople, also, Soyer visited the Sultan,

who presented him with a rich snuff-box set with diamonds; at least, he *said* he would, but some say the snuff-box never arrived.

Soyer was great on supplying excellent lemonades and other refreshing drinks to the wounded on the field of battle. Unfortunately his exertions there made him still more ill, and, indeed, he was very near dying. A very young doctor, however, a Mr Vincent Ambler, succeeded in curing him, and, after a restorative sojourn on the Bosphorus, Soyer returned to his labours at the front. He was blessed with the invaluable co-operation of Florence Nightingale. He became, indeed, 'culinary commander' of a large portion of the army. On his return to London in 1857, Lord Panmure, the Minister of War, gave him a very handsome bonus in addition to his pay, to show his appreciation of his services.

Before this Soyer had done valuable public service to the navy by his inspection of the tinned meats supplied to it. Out of seven tins, only three contained really wholesome food! His suggestions concerning the preparation and flavouring of preserved foods were those of an expert. What an invaluable Food Controller M. Alexis Soyer would have made just now!

He had a passion for organisation, and he had a kindly heart. In 1847, when Ireland was in the throes of starvation, he went to Dublin and organised a soup-kitchen there. A temporary building was quickly put up, a steam-boiler and other boilers were erected on wheels, the whole being worked by one central heat. Excellent and economical soup was given out, and in about four months over a million of people were fed! What a glorious system of communal kitchens M. Soyer could have organised for us to-day!

Some years later he was busy setting up soup-kitchens and arranging Christmas feasts for the poor in London. With characteristic gaiety of heart, he gave forth his soup to the cheerful accompaniment of a band. What an excellent idea, always to make merry when one tries to do good!

Not only the provider, M. Soyer became also the historian of food, and in his *Pantropheon* he gives us much curious lore. Some one wittily said that when he wrote of certain dainties he did so 'with a skewer dipped in the dripping-pan of modern Greece.' But it is easy to poke fun at the indefatigable Alexis; it is less easy to imitate or even emulate him.

He had a high idea of the office of cook, and tells us that 'in the Middle Ages the cook of a house of any note always seated himself in a high arm-chair to give his orders. He held a long wooden spoon in his hand, with which he tasted, without quitting his place, the various dishes that were cooking on the stoves and in the sauce-pans, and which served him also as a weapon with which to chastise the idle and gluttonous.' Most potent and wonderful spoon!

*Punch* delighted in M. Soyer. 'In your hands,' he says, 'the *casserole* becomes eloquent, and the *marmite* utters its moral.' He has several serio-comic tributes to his gastronomic excellences. Soyer's own humour is somewhat elaborate. It consisted largely in long metaphorical cooking recipes, beginning with, say, 'Deposit in it a smile from the Duchess of Sutherland,' &c. It is a favourite form of literary conceit, and an anthology of such trifles might amuse us in our hours of ease.

M. Soyer died at the early age of forty-nine, his activities and his vivacity having completely worn him out. He lived every minute of his life, and if it was short in years, it was long in its accumulated energy. It is said the M. Alcide de Mirobolant, in Thackeray's *Pendennis*, is founded on Alexis Soyer; but if so, it is only a caricature of Alexis's lighter and more grotesque attributes. Beneath Soyer's fanciful exterior and flamboyant manner there rested a sterling character, a sound, clear head, and no mean gifts of organisation.

#### WHERE THE FOUR WINDS MEET.

THERE are songs of the north and songs of the south,  
And songs of the east and west;  
But songs of the place where the four winds meet  
Are the ones that we love the best.

'And where do the four winds meet?' you ask.  
The answer is ready at hand—  
'Wherever our dear ones chance to be—  
By air, or by sea, or land.'

So the sailor, keeping his midnight watch  
'Mid icicles, snow, and sleet,  
Can think of a village near Portsmouth town  
As the place where the four winds meet.

And mother, perhaps, and sweetheart true  
Pray hard for the North Sea Fleet,  
And harder still for the boy who's gone  
To his place, where the four winds meet.

And the man on guard at the 'firing-step,'  
'Mid star-shells shimmering down,  
Can think of his home—where the four winds meet  
In some sheltered English town.

And thoughts may fly to the distant trench,  
Whatever its name or 'street,'  
For 'Somewhere in France' seems far less vague  
If we add, 'where the four winds meet.'

And the pilot steers thro' the trackless waste  
While the engines throb and beat,  
Flouting surprise, with the Army's eyes  
High up where the four winds meet.

And to those who mourn comes a cheering cry,  
Which the angels in heaven repeat,  
'Grieve not, brave hearts; we await you *here*—  
*Here*, where the four winds meet.'

There are songs of the north and songs of the south,  
The east and the west complete;  
But here is a song of the place we love,  
Which is called, 'Where the four winds meet.'

GEOFFREY DALRYMPLE NASH.

## SEVENTH SERIES

### THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

OF the great cities I have known, lived in for a while, and tried to understand, Washington, capital of the United States, seems to me to exert more than almost any other that special influence upon the mind of a receptive traveller of 'growing upon us,' as it is said. When we remark that a town or a country 'grows upon us'—this odd idiom being used chiefly of places—we pay it a compliment. We agree upon its solid worth. We suggest that its beauties, its qualities, its richness do not lie upon the surface; it wears not its virtues upon its sleeve. Here is nothing pretentious, nothing gaudy and meretricious, no blatant self-advertisement or the material and spiritual shoddiness that is often its companion. And, saying that a city grows upon us, we covertly pay a compliment also to ourselves for our discrimination and our standards; because the cities that thus increase and strengthen in our appreciation do so not by their material but by their spiritual worth. This is not to be disputed. Paris and Rome and Madrid grow upon us. But Paris leaps gigantically in our minds from the outset, because she is brilliant and rich from the surface through; like a magnet, she draws the stranger to her when he is far away; she enchants him at the first glance upon her smiling, keen, and classic countenance, and he is lost with her thereafter, for her charm never ceases to increase. Thus Paris grows upon us in a peculiar and intensified sense, as other cities never could. If any one informs you that he or she cares nothing for Paris, you may with confidence draw certain conclusions. Rome also grows upon us, more subtly and with subdued ecstasies; but Rome begins with vast advantages from the past. Few stay long enough in Madrid to understand the peculiar attractiveness of the Castilian city, which is cold and sombre at the first glance, and so its merit is the more as its attraction fast increases, which is commonly the case. Our foreign friends of taste and understanding almost all agree that London grows upon them, and often they say that at the outset they find it imbued with a certain cold, insular dullness; that unfamiliar Northern tints—copper, an infinite range of grays and opalescent—play through the lights

of the cooler seasons with a strange effect, which somehow conveys to the mind an impression of strength, of austerity perhaps, but yet of something that needs consideration and will yield reward for it. As London grows so much upon the Briton, and even upon the Londoner himself, it must surely exert that process upon the stranger too.

\* \* \*

But Washington is different from all others. It exercises a strange influence, this newest and rawest of capitals, which yet in some sense in these straining times becomes the chief capital, the most influential city of them all. It is a fountain of capacity for war and victory. From here the supreme direction of the material and spiritual forces of the United States, brought into the conflict for our needed support and for the good of humanity, is made by a far-seeing and well-minded statesman and the men he has about him. Here is the seat of government; here are the halls of the great departments, the vast administrative machinery, the Capitol, the national archives, and the majestic symbols of the birth and the fine maturity of the capital of the freest people. When we have been a little time in Washington we begin to feel this, and the feeling deepens as understanding increases. To know even a little of America one must have a fair working intimacy with New York, Boston, Chicago, and Washington, for these are the strong types, the powerful individualities. They are all very different, stand sometimes for opposite departments of labour and thought, and even, as one might almost say, of attitude to life. Washington, indeed, is very different from the others. She does not hum and sing with industries as they do; there is a certain staidness and a calm about her. She hustles little, reflects the more, feels the responsibility upon her. She too, like our London, has her austerity. Whirled in a parlour-car on an afternoon express through Philadelphia and Baltimore, from the glitter and warm life of New York to the dignified city, consecrated with the name of the great man who fought for the establishment of the independent American Republic, and was her first President, a traveller feels, therefore, a little chilled on arrival; yet through experience he knows he has but to

bide, and a great influence and impression will come upon him. On the day I first went to Washington I realised that it did not bear its greatness upon the surface, despite the magnificence of the Capitol, of the Congressional Library, and of the Washington Monument, tall, plain, gaunt, and sharp. In after-days one came to realise that there was a certain hint, if unconsciously made, in the lines that are cut over one of the arches of the grand façade of the Union Railway Station (which is itself a fine and impressive thing): 'He that would bring home the wealth of the Indies must carry the wealth of the Indies with him; so it is in travelling—a man must carry knowledge with him if he would bring home knowledge.' You must take with you to Washington, if not the spirit of a true American, a real and sincere appreciation of what he is and what he stands for, the value of his ideals, the dignity of his vast labour, and the greatness of his country. Then, with a sense of that greatness within you, the glory of Washington may be revealed. There will be enchantment then. I remember doing, without preconceived intention, during an interval on my second day in the place, something to which I had not been moved since last in London, an affair that is not a common occupation or diversion with Englishmen in America—namely, wandering through some second-hand bookshops which made a display in a leading thoroughfare. It was a rare and fruitful entertainment. Unexpected American revelations were vouchsafed—an old French book such as is not easily procurable nowadays, and a volume (printed and published in New York) of Robert Louis Stevenson's stories, including 'The Merry Men' and 'Dr Jekyll and Mr Hyde,' in one of the most tasteful editions that I have encountered. As one of those who are inclined to inquire into the origin of impulses and instincts, I have sometimes wondered why others like myself have turned so naturally to the old bookshops in Washington and scarcely elsewhere in that land.

\* \* \*

Indeed it grows; it mounts in the mind; it begins to sing to the surprised wanderer the thrilling, romantic song of the pride and wonder of national effort, the dignity of freedom, the grandeur of ideals and sincerity. This is the capital of freedom, and the emblem of power and strength. Soon in Washington you begin to perceive, amid much that is simple, and much, again, that is impressive, that, with more reserve and more sedateness than are witnessed in other American cities, Washington has a certain proper consciousness of its meaning and its matchless strength. It was rising to supremacy before the outbreak of the war; to-day it has taken the good nations by the hand and walks with them, giving them succour that they need. We cannot now speak of *the* greatest nation. There are

ways in which each of three or four is greatest, and in some dominant matters it is now certainly and clearly the fact that the United States is the greatest of us all. She entered the war at the crisis when, without her, the world might well have been lost, and besides men and things she gives to her friends the gold which is needed and in which she is the richest of all. To-day, therefore, Washington is indeed at the very heart of things, is in some respects the capital of the world. And yet when Paris and Rome and London, each of which has a history that fades back into the dim distance of the farthest past, so that it is then given over to the gods and they are credited with the origins of these centres of man—when these were very old, almost as we know them now, there was still no Washington at all. It was but a patch of wild and virgin America, with prairie and woods expanding towards the flowing Potomac. And now it is a chief of cities. Day by day we read in the papers of the mighty things, truly mighty, that are being determined upon and set on foot at Washington. London, Paris, Rome—they look to Washington. Germany pretends she fears no Washington, yet knows the fateful meaning of that name to her. As General Washington in his own day fought for freedom, so does the city to which his name was given stand more for freedom now than ever before. One seems to imagine his spirit come from Mount Vernon, where he lived not far away, and, brooding upon this place, strengthening the determination of her people, steeling their hearts for the sorrows that must precede the final triumph. I feel, indeed, that the spirit of this immortal broods over the portentous city. When you see the white Capitol shining in the moonlight you may think so. But otherwise there are no fairies and but little legend about this fine and practical and well-ordered city, where hard sense is talked and thought, and cold decisions made, which are then driven through with the tremendous force of a hundred millions of free men in a land which even yet is extremely young. No god or demigod pitched upon Washington for the place of his fateful headquarters; Jupiter and Juno, Apollo and Venus—they seem all to have ceased their loves and their quarrels, or at least to have betaken themselves to some heavenly privacy long before the time when the new city, which was to be big with human fate, like Troy and Rome, was shaped.

\* \* \*

Its story is wonderful in simplicity, and here again we see the impingement of French intimacy and affection in the early history of this great state. The American Republic having been founded, when freedom had been achieved, a capital became necessary. This was a matter to be gravely thought upon; eternity was being handled. Three existing cities were chiefly considered, New York, Philadelphia, and Balti-

more, and there were inevitably sharp discussions, keen jealousies, and a general dissatisfaction. So Congress then did rightly, for it called George Washington, the President, and empowered him to select a site for a new federal city that should be laid out and built, and made beautiful and great, on the banks of the Potomac River. He chose this place, and it is said that it was one over which, in his young days as a surveyor, he had lingered admiringly, feeling that some fine use should be made of land so fair. Most great cities lie in saucers with hills about them; by this is yielded a sense of comfort and compactness, scenic beauties are provided, and the hills give shelter from the blasts and bear fortifications against the enemy. Of the old cities that are not built by the sea-shore there are hardly any of consequence, except Madrid (which is high up on a tableland), that do not, in varying measure, conform to this rule. By it Washington abides. It is laid out on the lower lands, with bluffs about it on every side, and as it has expanded the residences of the people have begun to creep up these hill-sides. And, the site being agreed upon, it was one of the French officers who had fought in the American army who was commissioned to lay out the new city. It is said that he drew the plans on a scale which was intended to be commensurate with the importance of the city as the capital of the United States, and that, though the details were modified in some measure by his successors, it is to him that the general plan of Washington, with its considerable beauty to-day, is due. The streets and avenues, regular and symmetrical, radiate from the Capitol. Wonderful streets they are, from thirty to fifty yards in width, and parks with them that, all combined, exceed in proportionate area those of any other city in the world. As we emerge from the Union Station the first note of space with parks is struck, and it is repeated continually. There are three thousand six hundred acres of parks in Washington—and some of them may yet be put to food. Less than three years after Major L'Enfant of the French army had begun a greater and more important planning of a city than had ever been done before, or has been done since, the Capitol was begun, and in 1800 one wing of what is now the central building had been finished, and Congress met there for the first time. It needed eleven more years to complete the second wing. Now, when the present European war was only three weeks old there occurred a centenary—and we British have always been given to noting and celebrating these periods—which was discreetly overlooked. We heard nothing of it. Somebody must have noticed it, but wisely decided to be silent and keep the secret still. It is only when delving into these matters that one discovers it, and now it really does not matter.

. On 24th August 1814 two British commanders,

Ross and Cockburn, bore down on Washington, and 'the redcoat mob,' as it is described in American works (and very well may we forgive in present times, as we could before them, this form of sentiment), gathered in the Hall of Representatives, and Admiral Cockburn, in the Speaker's chair, put the question, 'Shall this harbour of Yankee democracy be burned? All for it say "Aye!"' The 'ayes' had it; the building was fired, and only the walls were left standing, the President's house sharing a similar fate. For proof that we are not mere opportunists in expressing regret for this piece of stupidity now, that it is not another sad example of an expediency which is rampant through the world in these times of war, one may quote the simple judgment upon it contained in one sentence of John Richard Green's shorter history of our country: 'Few more shameful acts are recorded in our history; and it was the more shameful in that it was done under strict orders from the Government at home.' It is not to our moral advantage to overlook these things, to say that they should be forgotten by ourselves, and, if possible, by others. Britain, which is great, now understands that all mankind is weak, and that the effort for self-purification should be unceasing. We who see with truth so many faults in other peoples . . . No Briton of authority, so far as one remembers, had spoken in an American Parliament house from that time until a few weeks ago, when Mr Balfour made his stirring speech in the Capitol, with the President of the Republic listening attentively from the gallery. It is true; circumstances change with times.

\* \* \*

One sometimes suspects that we of the Old World are committed too much to blind belief in the virtues of mere age. The great movements in art and literature in Europe, especially in Italy, France, and elsewhere, gave the original models, in all the splendour of their inspiration and genius, to the world, and, until all standards change, nothing may equal the magnificence of those spiritual efforts. In that the worship of the past is right; but do we not too often deny, or perhaps not so much deny as overlook, the quality, the beauty, and the worth of modern work in which advantage is taken of those rare models of the past, where there is some copying by the cleverest copyists, and something perhaps a little second-hand about the general inspiration? America has for the most part naturally and inevitably reached to the Old World and the past for models. When acquiring a surface grandeur to be the complement of the strength and wealth beneath, she was too young and too busy for original inspiration and genius, and too hurried to wait for it. There she is, the child among nations, but with public buildings in every town, made with great solidity and with noble columns that strike tremendously upon the traveller's

senses. In Boston, New York (consider the Public Library there), and other cities there are many of them. Europe, with all its expenditure on armies and navies before the war, could not afford to be building such things, which are the delights of the freer and newer nations; and Washington abounds in them. When time has mellowed them, and ages have passed along, their beauties will be better; and when history has clustered about those walls and pillars, as it is so quickly doing now, their beauty will be the more enhanced by all the perfumes of patriotic sentiment. But that old prejudice has too much prevented wanderers from appreciating the triumphs of art in great masses in America. He is a poor fellow with a thin spirit who may wander through the great halls of the Capitol and the Congressional Library in Washington and not be moved by the artistic magnificence, the noble strength, the perfect taste of what he looks upon therein. The old Florentines and Venetians, were they in life again, would pay more heed to and gain more pleasure from the beauties of the Capitol than do some of the affected tourists; for the truth is that the Capitol, outside and inside, is one of the noblest halls in full existence. Its outside architecture is grand. As it stands an enormous pile on Capitol Hill, its dignity, grace, and beauty of design are splendid; and within its halls and corridors, its magnificent statuary, the vast canvases upon the great events in American history, the mural decorations, and the ceilings with all their allegories make us think better of America at every glance and thought. Ascend one of the surrounding hills late on a summer afternoon and look below to Washington; see the Potomac swirling by, the point of the

Washington Monument touching the sky, and, in majestic presidency over all the fine buildings that are grouped about, the white Capitol glistening in the sunlight, and your sense and imagination will then lead you back to some of those great pictures you had gazed upon in the halls of the national headquarters a day or two before. There was the landing of Columbus on San Salvador, De Soto's discovery of the Mississippi, the baptism of Pocahontas, the embarkation of the Pilgrims, the declaration of Independence, the surrender of Burgoyne, Washington declining overtures from Cornwallis at Yorktown, Cornwallis's surrender, General Washington's resignation. Here is no small history of man. Looking thus upon the Capitol, reflecting, we must come to a newer and fuller realisation of the tremendous meaning of that simple descriptive phrase 'the New World.' There are still some vacant spaces on the walls of the Capitol. New and even greater scenes will be represented in the pictures that a few years hence will be hung upon them, pictures of battles and of even finer freedom than America has yet thought of. . . . Day by day now we hear from Washington of the millions and more millions of money that are being gathered for the war, of the millions that are being sent to France, to Italy, to Britain. Those American millions of every kind have a different meaning for us from that which once they had. Washington has just told us that over nine millions of American men, women, and children subscribed to the last loan, the Liberty Loan. Next in impressiveness to the Capitol, the great national symbol is the Treasury at Washington, the storehouse of all the nation's millions. One must write more of Washington.

## THE FORESTER'S GIRL

### CHAPTER IV.

IF there were in the affections of Gavin Barrie one weak spot, it was for *La belle France*—a weakness which, with characteristic reserve, he scrupulously kept to himself. France, with her fair fields and rambling, unclean villages, her straight white roads, poplar-lined, and her vineyards, warm and winey—France, with her châteaux proudly aloof, and her gay streets, where every one lives on view, her crowded sands and surf-beaten rocks—France was his first and deepest love. Her vices and virtues, her charms and her defects, he could have no more brought himself to discuss than could your true knight his lady fair.

Two factors—one temperamental, the other that of circumstance—had combined to enthrone this goddess in his heart, there to be worshipped in jealously guarded privacy, and with a species of *mauvaise honte*, due to his being first and

foremost a loyal, bred-in-the-bone Britisher, for whom Great Britain in general, and London in particular, should irrefutably reign unrivalled. But Gavin, although in theory holding this view, was in reality, when at home, always homesick—never truly content except when he once again felt the coy waters of the Channel slipping away between himself and the white cliffs of his native land, each moment bringing him nearer to one or other of the fascinating seaports of her Latin neighbour. This trait in himself, while recognising, he nevertheless disapproved, not in a self-analysing fashion, for he was not given to introspection, but by studied repression, and this although his strong predilection for France was largely the result of the circumstances of his childhood.

No one acquainted with Gavin Barrie in his twenty-eighth year could have credited that the

tall young man of splendid physique and tireless energy had, as a lad, so fought for his life that public school and the British climate were vetoed by a succession of doctors; and his parents, being themselves unable indefinitely to leave the home-nest and the rest of their brood, readily entrusted the weakling to childless and adoring godparents of that leisurely, lovable contingent who take life lightly, and do not realise responsibilities beyond the narrow limit of their own immediate interests.

With them the delicate child wintered in the sunniest spots on the Riviera, spent his spring-times among the steep, wooded valleys of the Hautes Pyrénées, his summers on the sands of Normandy or the wave-washed reefs of Finistère. With them he first saw the gleam and glitter of Monte Carlo, the gorgeous flower whose poisoned honey he was too young to sip; with them he learned to love the brown faces of Breton fisher-folk and the rainbow hues of the sardine fleets; with them, last but not least, he came to know and understand that miracle of masonry, the many-sided metropolis of the Seine. Flowed as water over a mill-wheel, from his childish tongue, the language of his foster-motherland, and his sensitive ear early learned to detect every variant of accent—north, south, east, west, mountain and sea-board, town and champaign.

So much for environment. Now, as to breeding, Gavin was that paradox, a pure 'cross'—a sire from the Lowlands of Scotland; a mother of good old Devonshire stock, of blood as rich and red and warm as the earth of that richest, warmest, reddest of counties. In the offspring, however, of this ill-assorted pair there was no proper blend. The Scotch temperament inherited from the paternal side—cold, unemotional, taciturn—lay like a crust upon the quicksilver of his mother's heritage—a heritage of strongly artistic bias, swift sympathies, and supersensitiveness to the moods of others. This vein, so to speak, in the Anglo-Scottish boy, his French environment had at once tapped. It welled to the surface, and, as the result, as it were, of barometric pressure, for the time being flowed freely over the thicker and denser epidermis of his Scottish anatomy. Beneath the sunny skies of the *sud-pays*, among the rose-acres of Grasse, the gay, light-hearted crowds of Aix or Nice, this bud from a south of England plant fairly expanded like an exotic in a hot-house. All day long his nimble tongue rippled along in the language which seemed so easy of expression in comparison with the clumsy medium of his native speech; his great gray eyes were lit with perpetual lamps; his small feet danced to the music of alluring bands in café or casino.

Boy-like, he, of course, vowed he detested France, and, with the child's instinctive longing for home and mother, counted the months until those rare holidays which found him alike

muffled and rebellious in a corner of the parental brougham, rolling along the parental miles of deep-shaded drive to the parental dwelling in all its Elizabethan solidity of stone and beam. But although it was ripping to have mother to tuck him up in bed, his brothers and sisters for games of hide-and-seek in the great corridors; to see the dogs again, and ride his pony, yet always there was a sort of insidious chill that invaded the little body, a cloud of depression which settled on his spirits, until his mother, filled with forebodings over his big-eyed, wan appearance and silent ways, would, in spite of his father's iterated remonstrance that the boy would grow up a foreigner and useless, hurry him off again to his friends and France.

The day came, however, when paternal objections overruled those of the medical wise-heads, and Gavin found himself suffering and struggling his way through public school, where, having quickly divined how remote in every particular from his companions was his life in the fair land across the Channel, he called into action all his strength of will to stop the bubbling of the quicksilver in his veins, and bury beneath the upper stratum of Scotch dourness all the warmth and mobility of his better nature. The lamps in the gray eyes were turned low; the tongue that had rippled along so readily in his adopted language became unwontedly silent; albeit a few well-placed hits from the shoulder settled, once and for all, the designs of his school-mates to dub him 'Frenchie.'

Of one tell-tale habit, however, he could never free himself—to search out and bask in every beam of sunshine that found its way into the school precincts, earning for him the nickname of 'Salamander,' a name which followed him from Eton to Oxford, and thence back to his beloved Paris and the *beaux arts*. By this time, however, self-repression had so sheathed him that the butterfly boy seemed to have reversed the laws of nature and reverted to the pupa stage, so little resemblance survived between the unemotional, reticent man and that *enfant anglais* whose dancing feet and facile tongue had long ago won the hearts of the people in whose midst the greater part of his childhood had been passed.

Consequent upon the death of his godparents, and the inheritance of their considerable fortune, Gavin found himself under no pressing necessity to follow up his chosen profession—that of an architect; and this contingent, falling in well with the streak of quasi-laziness running through an otherwise energetic nature, led to his spending some of the best years of his early manhood in travel. Here again, however, cropped out a characteristic, almost an obsession with him—such an exaggerated aversion to posing as anything other than a commonplace, matter-of-fact Englishman, that, repudiating the inference that he travelled for the sake of intellectual profit

and pleasure, he lightly set forth that it was his 'hobby to try all sorts of fishing in all sorts of places.'

Those who knew and understood him least, among whom, of course, were his self-absorbed sire and, under that subtle influence, his mother also, saw in this avowed devotion to a mere pastime the sure signs of a prospective wasted life. There were some, however—a small minority—who recognised and believed better things of this self-incriminating young man, and among them Kenneth Grey, his chum at Eton and Christ Church, on the sole ground, apparently, that both of them had insatiable appetites for fish!

Grey, however, with the stern obligation upon him, as he expressed it, of making a living for himself off other people's bones, had so buried himself in hospital wards and dissecting-rooms that the close friendship of earlier years might have been altogether ended had not a rare opportunity presented itself to the young medico of studying some special disease in a famous Paris hospital. There, out of zeal to make the very most of this exceptional chance, Kenneth Grey overworked to the verge of a breakdown,

until one day, wandering solitary and low-spirited in the Champs Élysées, he suddenly came face to face with his old chum. The sequence of this *rencontre*, tickets to Montreal and the Canadian Pacific Railway, and thence to California—Gavin as host, willy-nilly.

'It's those "cut-throats" in the lakes among the Granite Mountains that we really *ought* to have a try for,' Gavin had urged as casually as though the expedition proposed were merely to the fish-ponds at Versailles. 'Wonder if they are as big as they *say* they are, or if it's only another story on the usual scale of American bigness! At all events, Kenneth, you've got to come,' he wound up, glancing at, and then away from, his friend's white face and weary eyes. 'No use to kill *yourself* before you've killed your fair share of *other* people; and by the time we get back there'll be lots more babies born for you to go to work on.'

Thus had it come about that among the passengers in Charlie Axel's dust-laden vehicle were two young men upon whose clothing any intelligent poodle might still have detected the characteristic aroma of a *café français*.

(Continued on page 86.)

## OLD-FASHIONED.

By Mrs G. R. GLASGOW.

ON reading over a poem or a story written, say, ten years ago, it is often astonishing to find how very much not only our point of view, but our phraseology, has changed, and that what we felt keenly, even passionately, in the writing leaves us untouched on re-reading. We are instantaneously conscious that though in its essence the thing may still be true, in its expression and in its form it is out of date, which is a degree worse than being old-fashioned!

To be old-fashioned in words and ideas, and even in ourselves, implies a change, but not a loss, of charm; but to be out of date argues a want of suppleness, of adaptability, a narrowness of mind, that is always regrettable, and often deplorable. If we wish to keep in touch with the thought of the day, and still retain our own individuality, we must find the golden mean between a love of every new thing, which causes us to be swept off our feet by every change of wind and tide, and an obstinate regard for 'the good old days,' which leaves us high and dry and solitary, whilst the living stream of men and women passes us by.

To keep warmly, vigorously alive, it is necessary to cultivate an open mind as to the next generation, or, so slow of growth is the training of public opinion, so gradual the alteration, it is only when it is too late that we shall realise how very much out of the running we are.

Take, for instance, the charity of fifty years

ago. To give a penny to a beggar in the street was then considered the acme of self-sacrifice for any good child, and in fiction, if not in real life, the reward was commensurate with the effort. The child who preferred to buy bull's-eyes or marbles was looked upon as a selfish monster by less daring companions, and was, as Mrs Sherwood tells us, unhesitatingly condemned to an uneasy conscience by the laxest of parents. Those who were brought up in that faith, and who did not notice the gradual trend of popular opinion in another direction, spoke of themselves smilingly as old-fashioned, until, with a sudden leap from the Middle Ages to the twentieth century, they realised that they were not only old-fashioned, but out of date, which is a much more serious matter. Speaking generally, charity is no longer a personal thing, or a matter for the individual conscience. Guilds and organisations have taken it in hand and treated it scientifically, and if the number of the poor does not seem to have diminished, still beggars no longer dare to beg publicly, and we need no longer be imposed on. Their state is kindly and skilfully diagnosed and treated, and often cured, or they are passed on to no less admirable organisations where the most is made of the smallest assets; and if they themselves are hopeless, at least their children have a chance of regeneration.

But it is well to remember that, if you give to the great and dominant charities, you do not

with the gift surrender your birthright. If, through laziness, or false pride, or real humility, you fail to give personal help also, it is the charity which receives your donation—the committee that dispenses it—that has gained the ultimate reward, and not *you*; money weighs very little in the balance against time or love or sympathy. Organisation should be a bridge between riches and poverty, not a wall.

Then there is the question of *manners*. Good manners, as they were understood by an earlier generation, are distinctly old-fashioned. In a rather hurried world it was found inconvenient to waste time on courtesies of writing or of speech. People who wished could take such things for granted. The younger generation had no leisure for them! It does not ask for consideration or courtesy itself, or help from man or woman. Why should they give it? It makes the young people, especially the young women, impatient, scornful. It wanted to be down in the arena, fighting shoulder to shoulder with the crowd, not sheltered or spared, hardly asking even for love; but that, of course, it cannot regulate. Love falls, like the rain, on the just and on the unjust, and asks for no return!

It is a reaction, no doubt, from the narrow, sheltered girl-life of the past, which ended in virtual slavery. The mother of to-day is suffering vicariously for the ignorance and intolerance and narrow vision of the mothers of yesterday. The sight of whole families of dull, good, unhumorous, unmarried aunts moves the girl of to-day, not to imitation of their methods, but to a settled determination that she, at least, will not be hypnotised by any plea of duty or propriety into such a tragic fate; that she will 'get on or get out' into some sort of freedom, or a less suffocating atmosphere.

It is out of date to resent or deplore or revile this attitude, but it may be guided into a healthier manifestation, because good manners do come more or less from a good heart, and, as Uncle Esek says, politeness is a kind of godliness, and though it may not make a saint of a man, it makes a lovely sinner! They are not merely a sentimental veneer, or a cloak for hypocrisy, as some sturdy natures imagine; for it is a fact that when a friend dies we do not remember or feel greatly interested in whether she 'painted in water-colours,' or called herself a Suffragette, or 'was cousin to Lady Jones,' but only whether she was kind and lovable, and was pleasant to live with.

So with the domestic service of to-day—what is generally known as 'the problem'—servants do not want to be understood, or made one of the family. They ask only to be let alone, to have definite work and definite hours. They prefer an 'order' to a 'request.' Twenty years ago another method was taught. 'Always speak

to a scullery-maid as if she was a duchess,' was the essence of it. One might possibly be rude or cross or peevish in the drawing-room, but never to a servant, because the position of a servant was presumed to prevent her answering back. It might be excusable for us to be domineering to our brothers and sisters, because they could put us in our place, but never to the maids.

But times have altered, and the principle has changed. The scullery-maid is quite satisfied with the equality, or even the superiority, of her position; she resents being treated like a duchess. Deference and consideration, blended with care for her body and soul, no longer appeal to her; she only wishes to be left to herself. Her mistress's suggested amusements do not, as a rule, amuse her—she does not enjoy the books her mistress lends her; she no longer wishes to copy her dress. All the old allurements are lost on her. She gives us to understand that we are out of date, that our landmarks have been removed, and that to try to put her at her ease is an impertinence. 'Nature, red in tooth and claw,' is what she has been taught to expect in service, and she is really rather disappointed if she does not find it. Kindness and courtesy represent to her a state of feeling that is hopelessly dull and old-fashioned.

This, too, is a reaction, and we must try to understand and to appreciate the newer and more independent attitude. The old idea was partly a survival from feudalism, when a man's house was literally his castle, and he was responsible for all in it, and especially for his helpless, ignorant, simple dependants. The maids and men-servants were part of the family circle. They were trained in their duties by the mistress herself, and clothed, fed, and supported. They held a position as honourable as that of the children of the house, and quite as clearly defined. But that was bound to change. A wider education and a general raising of standards, cheap travel, and shoals of inexpensive books have altered the outlook on life, and excited passions and ambitions which are not the least wrong in themselves, but are not always desirable or easily realised, and which will doubtless settle themselves with another swing of the pendulum. The disappointments and hard lessons of life will have a bracing effect on indolent, gentle, adaptable natures, and will open their eyes relentlessly to the onward march which they have not noticed, or have decided to ignore; and, on the other hand, rudeness *qua* rudeness will cease to be considered smart; graciousness will not be, to the next generation, only a sign of weakness, any more than it was to the last. Goodness of heart will still produce its harvest of kindness and gratitude, though possibly it may wear a new disguise, until the young of to-day are in their turn old-fashioned!

## 'No. 13.'

## PART III.

**D**URING the two following months I wrote a few times to Doña Maria, who answered my letters, giving me all the little interesting items of news. To Candidad herself I did not write, fearing that by doing so I should be committing a breach of Spanish etiquette, which I knew to be very strict. I was kept hard at work up to Christmas week, when I left London with my mother and sisters for Southport, where we were to spend the holidays with my aunt, a married sister of my mother's, my father remaining in town till Christmas Eve.

He came as arranged, and on Christmas morning, at breakfast, while we were chatting, he suddenly clapped his hand to his breast-pocket, saying, 'By Jove, Fred, I must be losing my memory! Here is a wire that came for you just as I was leaving the office yesterday. As a matter of fact, I met the boy in the hall, and stuck it in my pocket, and forgot all about it. But I hope there's no harm done.'

I opened the envelope. The telegram was dated Madrid, 23rd Dec., 3 P.M., and the wording was: 'The fat\* one has fallen to you. Am writing, and sending journal.—DAVILA.'

I had got the first prize in the lottery. Two days after, I received a copy of the *Diario* of Madrid, and on opening the paper was confronted with a large-type heading:

'ROMANCE OF THE LOTTERY.—At the drawing which took place this morning the first prize of six million pesetas fell to ticket No. 13, and in connection with its sale Doña Clementina Ortiz, the popular administratrix of the office No. 13 had an extraordinary story to tell our representative.

'It seems that on the 13th of last October two gentlemen presented themselves at the office named, and asked for a ticket. They were requested to wait a few minutes, as a further supply had been sent for to the Treasury. There had been a great demand for tickets during the morning, the manager of the Madrid branch of the Bank of Peru alone having purchased a large number for Lima. Doña Clementina jokingly told the two gentlemen that as a matter of fact the only ticket she had left was No. 13, which, of course, no one would purchase. Whereupon the younger of the two said he would take the whole ticket, as he was much impressed with the triple coincidence that the number of the ticket was 13, as was that of the administration, and, to make matters complete, it was the 13th of the month. Surely, if a courageous contempt for a widely accepted

superstition was ever rewarded, it was in the present instance! We understand that the young gentleman in question appeared to be a foreigner, though speaking Castilian fluently.'

We all returned to town a few days before the New Year. I waited on the manager of the *Crédit Lyonnais*, and asked him to forward my ticket for realisation to the head of the branch in Madrid. 'I suppose,' I said, 'there will be no difficulty?'

'Oh no! none whatever,' he replied. 'As you see on the back of the ticket, it is a document payable to bearer.'

Ten days afterwards I had a letter from the London manager informing me that he had to my credit a sum of two hundred and sixteen thousand pounds.

Of course, my impetuosity urged me to return to Spain at once; but I yielded in the end to the advice of my father and mother, and decided to go on as usual until the following summer, when I might revisit Seville, and see how matters would shape themselves.

The acquisition of my large fortune had, of course, made a great difference. My father's business had prospered exceedingly, especially of late years, and he was what, even in the City, would be called a rich man. Should I determine not to continue the business of Widders and Cripplebury—as, indeed, I had no desire to do—the question arose whether it would not be advisable to get rid of it. My father was now some sixty years of age, and was there any need why he should continue in harness? However, all decision was deferred for the present. There was no reason why we should make any change in our way of living, as we had always been in more than easy circumstances; and so the house at Highgate went on as usual.

Time seemed to me to crawl through the spring and early summer; but at last July came, and I wrote to inform my friends in Seville that I hoped to see them about the end of the month.

I could see that both my father and mother, while offering no opposition to my choice, were somewhat doubtful. Naturally they had always looked forward to my one day seeking a wife among the daughters of our many friends. I had always been very much attached to my mother, and truly not more than she deserved; and as the time drew near for my departure I felt very keenly the evident sadness that was coming over her.

A week before the day fixed for starting, as she and I were alone together, I said, 'Mother, there is no use in pretending. You are not

\* In Spain the chief prize in the Christmas drawing is universally known as *el gordo*, or 'the fat one.'

happy in this business. Neither is my father. Now, confess truly, do you not think you would be more content if you knew the girl that I want to make my wife?'

'Well, Fred,' she said, 'I suppose I should be less than your mother were it otherwise.'

'Very well,' I said, 'you shall see her. What is there to prevent you from coming with me? We will go overland. You can rest a few days in Paris, and again in Bordeaux, and again in Madrid, should you wish. And—though I think it would pretty well break my heart—if you do not approve of my choice, I will at any rate promise not to do anything further for the present.'

On taking my father into our councils he quite approved of the idea, but saw no need of the overland journey, as the weather was so fine, and my mother not a bad sailor. So, in the last week of July, we left London on a big liner, which called at Gibraltar, where we arrived on the fourth day. We reached Seville three days later, and were met by Don Andrés and his wife, to whom I had written. They would not hear of our going to an hotel, and so, the same afternoon, we drove out to Alcalá. There we found the young lady to see whom my mother had journeyed so far. I could see that my mother was very favourably impressed, but I resolved to let her give her opinion in her own good time. Meanwhile we were fully occupied in taking her round and showing her all the sights of Alcalá, with which she was delighted.

One of our visits was to Santiponce, as my mother was a good deal of an antiquarian; and while she and the others rested at the inn at Triana, I made my way to the charcoal-burners' hut in the pine-forest. I found my friends of last year still to the fore, and gave them much pleasure by handing each of them a very good, large clasp-knife which I had brought from England. I need not say that all this time I was on thorns to hear my mother speak to me on the subject nearest my heart, but I knew she was not one to do anything in a hurry or without seeing her way clearly.

At the end of ten days my mother spoke. 'Fred,' she said, 'I think it is time that your patience should be rewarded. I am very much in love with Candidad. I think she is a most charming girl, and one who would make a good wife. Of course, I have not had a chance of hearing her at her best, owing to my ignorance of Spanish; but I can only suppose that if she is so very captivating when she speaks French, she must be irresistible when she brings her Castilian to bear on you. Now what do you think of that for a compliment to your *señorita*?'

I could only express my gratitude to my mother, and my joy at her decision.

I lost no time in speaking to Don Andrés and Doña Maria the very next day. They were both

quite prepared, as, indeed, my mother, with a woman's intuition, had declared they would be. Doña Maria replied for both, and said, 'We can assure you, Frederico, that we will entrust our dear daughter to you with the utmost confidence. Of course, we know that you are now very rich, but I think you will believe me when I say that even were it otherwise we would still entrust her to you, as we are certain we should be consulting her happiness.'

We were married in the parish church of Alcalá de Guadaira on the last day of September, the anniversary of the marriage of Julian Alvarez and Mercedes, and left in the afternoon for Carmona, some ten miles distant, where Julian had a small country-house, which he put at our disposal. In the middle of October we were all in Seville, and at the end of the month my newly made wife, my mother, and I left for Paris on our way to London.

Nothing had been settled as to our future residence. On our arrival we all went to Highgate, and up to Christmas my time was pleasantly occupied in introducing my wife to my English friends, and in entertaining and being entertained by them.

Shortly after Christmas we were all much alarmed by a severe cold which Candidad contracted, and which did not seem to yield to the doctor's remedies. She became in the end quite worn out by a persistent cough, which prevented her from getting any rest at night. The doctor confessed that he was not satisfied with the result of his treatment, and, at his suggestion, a famous specialist was called in.

The great man was very frank and explicit in giving his opinion. 'Mr Dutton,' he said to me, 'your wife is, up to now, free from any organic disease; but I cannot answer for her continuing so. You have brought her from the sunshine in which she was reared into the cold and damp of an English winter, and my advice—and it is a very urgent advice—is that she should be restored to the sunshine as speedily as possible.'

Three weeks later I was sitting with my dear girl in the sunshine, outside a small villa which I had rented at Torremolinos, two miles from Malaga, and there we remained until April, when I left for England to arrange for the future. Her mother and Mercedes had come to stay with Candidad during my absence. The London doctor was right. The sun had cured her.

I finally made up my mind that it would be impossible to continue in the London office, and it was arranged that the old house of Widgers and Cripplebury should be wound up. There was no reason why my father should not enjoy a well-earned rest, and, as I said before, there was no other son to succeed him. So within the next few months our affairs were settled, stocks sold out, and the old house in Dove

Court, which was our own property, let out as offices.

A life of idleness was little to my taste. I could afford to bid adieu to commerce, but did not for a moment think of doing so, and determined, on my return to Spain, to look about for some way of employing at least a portion of my capital.

I was back in Torremolinos by the end of June. Candidad had completely recovered, and hoped that it might be a long time before any business would necessitate a further visit to England on my part. Indeed, I saw clearly that England as a place of residence for her was out of the question. I had been within an ace of losing her.

The opportunity for which I was looking offered in a couple of months. A considerable property, consisting chiefly of vineyards, at San Lucar came into the market, owing to the death of its owner, the Marquis of Obrera. Nothing could suit me better. Besides the large tract of valuable land, there was a beautiful residence,

and there we settled down, and there I am writing these lines fifty years after.

My dear father and mother have been dead for more than thirty years. I have been to England only three times since my taking root at San Lucar—twice on the occasion of the death of my father and mother, and once, two years ago, when I accompanied my eldest son, who left his boy at school near London. It was on this occasion that I saw the last of the old house in Dove Court.

We have been very successful. Our Manzanilla is counted among the best wines shipped from Spain. My wife still shudders at the thought of the fog, and was very diffident about trusting her grandson to its mercies. I take very little part in the business now. That is the province of my eldest son. In his office there is a very ancient model of two oxen drawing a butt of sherry, and guided by two men in broad-brimmed sombreros. In its pediment my son has had a plate inserted with the words, 'The returned Exiles.'

THE END.

## BOOK-BORROWERS AND THEIR WAYS.

By CLIVE HOLLAND.

**F**EW people save the librarians of large public or 'lending' libraries have any idea of the vagaries of many of those who borrow books. Indeed, it would be scarcely imagined how careless some people are, and the way in which they often leave private correspondence in the books. For a whole year a well-known librarian of a public library kept a record of the things found within the pages of different volumes, and also of some of the cranky proceedings of the borrowers. Most people would be surprised at the variety of the articles found, and to know how peculiar some of the borrowers are.

For example, one lady subscriber to a well-known lending library threatened to withdraw her subscription because she found in the catalogue some books by a popular lady novelist to whom she appeared to have taken the most violent dislike. It was quite useless to explain that the novelist in question was one of the most popular 'circulating' authors. All she said was, 'I so detest the woman and all her works that it is a great source of annoyance to me to find her books staring me in the face whenever I come to the library; and unless I am assured that this shall not happen in future, I shall not only withdraw my subscription, but shall do what I can to get my friends to follow my example.' It is, of course, needless to say the proprietors refused to ban the books in question, and Miss ——'s books are still upon the shelves.

Then there are what may be called 'the unco guid,' who are always wishing to exercise a

control and censorship of the books that are put into circulation. It is unnecessary to say that no high-class library would, except by inadvertence, circulate (or continue to do so when such a book was pointed out) any volume of a really objectionable character. But there are some people who seem to think that the duty of libraries is chiefly that of a tract depot, forgetting, of course, that whilst the taste of some subscribers may be chiefly for serious books, others may wish to read books of a lighter character.

Although we are in the twentieth century, there are apparently quite a number of people who are nothing more than religious or political bigots. Not long ago one librarian received a letter, couched in the most insulting terms, demanding the withdrawal of a certain very brilliant book, which happened to be the work of a young politician for whom the subscriber in question evidently had the strongest antipathy. It was quite useless to point out that this book was one of the most popular works of the day. The subscriber's answer was, 'It is a disgrace for any respectable library to put a book by this writer in circulation, and thus give him most undesirable notoriety.'

There is also the peculiar type of subscriber who never seems exactly to know the name of the book wanted, and these expect librarians always to be able to put them on the right track. They will come into a library with the very vaguest idea concerning the book they have looked out in the catalogue. For example, during the

popularity of *Mrs Wiggs of the Cabbage Patch* quite a number of ladies not only thought it a work upon horticulture, but could even then give very little idea of the title. 'Mrs Briggs' was frequently the name used instead of 'Mrs Wiggs,' and several subscribers who wished to borrow the book said that they were going down to their country houses, where their gardeners did not always seem to please them in the matter of the vegetables they grew, and they were, in consequence, going to lend them this book, so that they might get a few hints. It was extremely difficult to persuade them that the famous 'Mrs Wiggs' gave no hints on the cultivation of cabbages, and when convinced of this they called the book a fraud.

But, although so many subscribers are extremely amusing, some of the most interesting things a librarian comes across in connection with his work are the curious articles so often left in the volumes when they are returned. Scores of hairpins are found in books. Only a few months ago a book was returned in which was found one with what was at first supposed to be a paste head, and one of the young lady librarians who had found it asked that she might have it. It was, however, against the rules to make over anything found in the books until a certain time had elapsed, and so she was told that she must put it aside for the present, but that if it were not claimed within the period of a fortnight there would be no objection to her having it. A few days afterwards, however, a young married lady came into the library in a state of great excitement, and asked whether in the books that she had returned a few days previously a diamond hairpin had been found. She was, of course, at once told that it had. Not a little to the surprise of the librarian, she informed him that it was worth five-and-twenty pounds, and that one night she was reading late in bed, and having forgotten to take out this hairpin, she slipped it into the book as a marker. By some error, the book was returned by her maid before she had finished reading it.

Numbers of other things are found in library books. One of the most expensive book-markers ever discovered was that found quite recently in a copy of one of Mr Max Pemberton's romances. On going through the book in the usual way the librarian came across a narrow slip of paper folded lengthwise, and upon this being opened it proved to be a cheque for no less than five hundred pounds, drawn by a company in payment of dividends. Needless to say, it was at once sent by a messenger to the gentleman, a well-known Park Lane South African, who had been so careless, and who, by the way, was not a little astonished to receive it. A day or two after a note of thanks was received from him in which he said that he had not even discovered the loss of a cheque!

Not very long ago a parcel of books was

received back from an artist who has a fine studio Hampstead way, and upon opening one of the volumes, a quarto book of travel, the librarian was surprised to find a most dainty water-colour sketch between the pages. As it happened, before Mr Blank, A.R.A., could be communicated with, he came in, and on being handed the sketch, with an explanation of how it was found, Mr Blank said, 'I was feeling a bit off colour a few days ago, and so I thought I would try to put down on paper my idea of the heroine of the novel which I was reading at the time. That is the result. I suppose I must afterwards have used it as a book-mark. Now,' said Mr Blank to the librarian, 'here's a "sporting" offer. If you can guess in three times who the sketch is intended to be, it is yours.' The librarian happened to be lucky, for at his second attempt he hit upon the heroine, and received the sketch, which was worth perhaps five guineas, as a reward.

Numbers of letters used as book-marks are found, and it is really astonishing how careless people are in this way of the most private correspondence. Often, of course, it is quite impossible to trace the owners of the letters, and at one time at a certain large lending library there was an astonishing collection of love and other letters. But love-letters are harmless enough when compared with some that are found. About two years ago, for example, there was great curiosity not only in Society circles, but in the minds of the public generally, regarding a certain broken engagement between a young lady and a man well known in military circles. The true reason of this broken engagement was set forth in a most detailed way in a letter from the young lady in question to a girl friend, who had evidently taken up the first thing that came to hand to mark her place, and had forgotten afterwards to remove it. If the letter had fallen into the hands of an unscrupulous person it might have caused the proverbial peck of trouble. It certainly would have created a considerable sensation.

Some years ago a well-known Cabinet Minister, who was not unknown for absent-mindedness, placed in the pages of a book which he was reading a small piece of note-paper containing the 'heads' of a most important political negotiation. If it had not been found by a person of discretion, a secret of some importance would doubtless have made its way prematurely into the public press.

Two of the most curious articles ever found used as book-marks were a narrow strip of human skin mounted on a piece of cardboard, which was said to have been flayed off the back of a Macedonian girl by a Turkish trooper during the troubles of some years back; and a ribbon garter, fastening with a gold buckle, which belonged to a well-known 'Gaiety girl.'

Many borrowers have curious ideas of honesty.

Quite a number of people think nothing of calmly removing the plates from illustrated works, either, it is presumed, to insert them in their own collections or to frame them. One type of book in particular, issued by a well-known publishing house, with illustrations in colour, has suffered much in this respect.

Finally, there are people, mostly country readers, who value even expensive works so little that they use them for the purpose of pressing flowers, moths, butterflies, &c., quite heedless of the fact that by doing so they are often seriously injuring valuable books which do not belong to them.

## THE MONTH: SCIENCE AND ARTS.

### BOMBS FOR LAYING BARBED WIRE.

**I**N view of the important rôle played by barbed wire in the present war and the danger to which the men who lay it are exposed, it is not surprising that efforts have been made to devise a system of placing entanglements in No-Man's Land without the men having to leave the trenches. Moreover, it is a great advantage if this can be done rapidly in the face of an impending charge of hostile infantry after the fixed wire has been destroyed by guns. To meet these requirements a species of wire bomb has been invented by Mr E. S. Wales, and was recently described in the *Popular Science Monthly*. This device consists of a bomb (with a time-fuse) around which are arranged four reels of barbed wire. A stem is fitted to the bomb by means of which it can be fired from a trench mortar. When the bomb explodes the reels are projected in different directions, the wire being unwound during their flight, and spread over a considerable area.

### AMERICA'S STANDARDISED AEROPLANE ENGINE.

When a mechanical contrivance, such as an aeroplane engine, is wanted quickly in large numbers, it is essential to standardise it; in other words, all the engines produced must be exactly alike down to the smallest screw or pin. The model having been approved, complicated and costly tools have to be made, capable of turning out the greatest numbers of parts in the least possible time. Moreover, all parts are made to what are known as 'limit gauges,' whereby accuracy is guaranteed, so that different portions of the engine may be produced anywhere, with the certainty that they will fit together when assembled. Under such conditions the greatest care must be taken to render the model perfect before standardisation, as it is impossible to alter any detail without causing serious delays once the manufacture is begun. These principles have recently been applied to the aeroplane motor designed in the United States for that country's huge aircraft programme. Co-operation between engineers and manufacturers resulted in the production of a satisfactory model, known as the 'Liberty Air Engine,' in the astonishingly short time of one month, and this engine is now being manufactured on an enormous scale. ● In this connection some inter-

esting figures relating to the safety of American aircraft were lately given in an official statement issued by the United States Government Department concerned with aviation. These figures begin with the year 1908, and the total casualties up to 28th April of this year number only fifteen, while no deaths are recorded for 1916 and 1917, although over seventeen thousand flights were made by two hundred and six aviators, who covered a total distance of more than seven hundred and fifty thousand miles.

### AEROPLANE PASSENGER SERVICES.

At a recent interview with Reuter's correspondent, the brothers Caproni, the celebrated designers and builders of Caproni aeroplanes, expressed a belief that, after the war, lines of aircraft will be run between various towns and countries, the machines being luxuriously fitted with accommodation for one hundred or more passengers, while the speeds will range up to one hundred and ninety miles an hour. They advocate aeroplanes with two or three motors of three hundred to five hundred horse-power each, as the adoption of several engines forms a guarantee of safety. These authorities also predict the construction of aeroplanes for service between Europe and America, having accommodation for fifty or sixty passengers, immediately after the war, and they point out that Caproni triplanes are already capable of carrying thirty passengers between Milan and Turin. The foregoing predictions are supported by the statement, on good authority, in the American journal *Aviation*, that an aeroplane is being built in Italy with motors of three thousand horse-power, which is designed to carry fifty passengers.

### HOSPITAL-SHIPS FOR THE TIGRIS.

Many extraordinary craft are in service on the Tigris for fighting purposes of which the publication of particulars is naturally prohibited. The various launches and ships for dealing with the sick and wounded, however, have been fully described, and of these the hospital-ships are of particular interest. Owing to the shallowness of the river in the dry season, all vessels intended for service up to Bagdad must be capable of floating in four feet of water. The craft referred to, although one hundred and sixty feet in length, with a breadth of thirty

feet, require only three and a half feet of water to float them. This light draught involves special arrangements for propulsion in the form of tunnels in the bottom of the ship for the propellers to work in. This device, in conjunction with a high speed of rotation, enables small propellers to absorb the high powers needed to give the requisite speed, while affording complete protection when the vessel takes the ground. In this case each propeller is driven by an engine of one hundred and fifty horse-power, and makes five hundred and fifty revolutions a minute. Oil-engines running upon paraffin have been adopted in preference to steam machinery on account of the saving in space, weight, and attendance, and, last but not least, because of the elimination of the heat that would have radiated from the boiler. The vessel has four decks, with the hospital accommodation arranged on the three lower ones. Convalescents are provided for on the 'flying-deck,' while the upper and main decks are reserved for more serious cases. Most of the cots are arranged in two tiers, one above the other; but a number of larger single-tier cots are provided for the more serious cases. A cot-lift is fitted between the various decks, so that patients can be transferred without being carried by hand up or down stairs. Extremes of temperature are encountered in Mesopotamia; hence heating, cooling, and ventilation had to be very carefully provided for. This has been done on the Thermotank Company's system, which supplies either cool or heated air to all parts of the ship. Every possible provision has also been made for natural cooling and ventilation. Included in the equipment are refrigerating plant capable of producing five hundredweight of ice a day, a soda-water machine with an output of three gross a day, an evaporator having a capacity of two tons of fresh water in twenty-four hours, a distiller for thirty gallons an hour, and a disinfecting-room with a steam disinfecter. Naturally an operating-room is provided, and all requisite surgical instruments and appliances. These vessels have been built by Messrs Livingstone & Cooper of Hessele, Hull; while the propulsive machinery was fitted by Messrs John I. Thornycroft & Co., Limited. It is interesting to note that Brevet Lieutenant-Colonel Carter, whose condemnation of the medical arrangements for the first Mesopotamia campaign must be familiar to our readers, has superintended the medical equipment of these vessels. The ships proceed to the Tigris under their own power, after being especially strengthened for the voyage. It is only fair, however, to state that the first hospital-ship to reach Basra and Bagdad was built for the British Red Cross Society, this vessel being constructed in sections, which were shipped out to Bombay, where the boat was erected and launched. Readers who desire further par-

ticulars of these vessels will find them in *Engineering* for 19th October.

#### FORD OIL-TRACTORS FOR GREAT BRITAIN.

One of the most astonishing developments caused by the war is the rapidly extending use of the oil-tractor, in place of horses, for ploughing and other field operations. It is true that fairly efficient machines of this type were on the market many years ago, but they were employed by only a few progressive farmers, horses or steam-machinery being preferred by the majority. The fact is that before the war the oil-tractor for ploughing and cultivating could only compete with horses under certain conditions, mostly confined to large farms and estates where almost continuous employment, in one form or another, could be provided. Under the new scheme of Government control, and because of the shortage of horses and the increased cost of labour, the position is altogether different. The small farmer, for instance, does not have to buy a tractor at all, or indeed to provide a driver. He simply applies to the agent of the Food Production Department for a machine to plough so many acres. In this way the tractors are kept busy and their cost is fully justified. The question of providing tractors was taken up strongly by Sir Arthur Lee when he was appointed chief of the department last February, and the Royal Agricultural Society were asked to test and report upon two Ford models. Their account being very favourable, arrangements were made for producing six thousand in this country. This policy, however, had to be abandoned owing to the exigencies of war, and the tractors were ordered in the United States from Mr Henry Ford. It is pleasing to note that the manufacturer is making no profit out of the transaction, the machines being supplied at cost price on condition that they are used solely under Government control. The tractor can be used, says Lord Northcliffe, who recently visited the Ford works in America, 'either as a stationary engine or to propel ploughs, mowing-machines, reapers, and binders.' A twenty-five-horse-power motor provides the necessary power, and it runs on paraffin, although a small quantity of petrol is needed to start it. Neither mechanical nor agricultural knowledge is required for driving these tractors, and they are fitted with electric head-lights, so that work can be carried on day and night. Indeed, their hum at night has already become familiar in many districts, and has not infrequently been mistaken for the noise made by aircraft. Each tractor is capable of ploughing an acre in two hours under average conditions. It is easy to understand that six thousand tractors, working day and night during the season for ploughing, will prepare an enormous acreage of land for wheat and other crops, which should go far towards defeating the U-boat menace. After the war Mr Ford is hopeful of

selling these tractors at one hundred pounds each—a price that will bring them within reach of the smallest farmers if they work on a co-operative basis.

#### COMPLETION OF THE QUEBEC BRIDGE.

It is satisfactory to learn that the Quebec Bridge across the St Lawrence, the building of which has been dogged by disaster, is at last completed. The structure consists of two enormous double cantilevers, resting at their centres and shore ends upon strong piers of masonry; while the gap between them, over the middle of the river, is bridged by a centre span measuring six hundred and forty feet in length and one hundred and ten feet in height, its weight being no less than five thousand tons. According to the first plans, the centre span was to be built out from each cantilever; but this structure was never finished, the south side collapsing under its own weight before completion, with a loss of over eighty lives. Subsequently the design was revised, and a new bridge of much greater strength was proceeded with. Instead of building out the central span from the cantilevers, it was constructed separately, with the intention of floating it under the cantilevers on huge lighters and lifting it into place. Unfortunately, when the latter operation was being carried out, the span slipped off the supports and sank in the river. By no means daunted by this second disaster, the builders constructed a duplicate span, which was lifted and fixed in position on 19th September. A very interesting account of how the final span was built and raised appeared in a recent number of the *Scientific American*, from which the following particulars have been taken. The structure was built on three pontoons fitted with valves to allow the water to enter freely, so that they rested on the bottom of the river in a position near the shore where the depth was suitable. These pontoons each measured one hundred and sixty-five feet long, with a breadth of thirty-two feet, and they were designed to float the span when immersed to a depth of eleven and a half feet. On completion of the work the valves were closed and the water pumped out, thereby floating the span, which was towed out to the middle of the river. From the end of each cantilever four massive steel chains made up of flat steel links were hung, each link being thirty inches long and one and one-eighth inches thick. The lifting was done, two feet at a time, by hydraulic jacks, each having a power of one thousand tons. At the end of every lift the span was supported by twelve-inch-diameter pins driven through the chains, which allowed of the jacks being adjusted for the next step upwards. The total lift of one hundred and fifty feet above the water-level occupied only four days. This bridge between the piers of the cantilevers

measures eighteen hundred feet, which constitutes the longest single span in the world, the next longest being those of the Forth Bridge, measuring seventeen hundred and ten feet.

#### RIVER NAVIGABLE IN DRY SEASON.

A drawback to nearly all navigable rivers is the lowering of the water-level during the dry season to such an extent that vessels cannot pass along the upper reaches. This difficulty has been ingeniously overcome in the Ohio River, so far as the down-stream traffic is concerned, by the United States Army Engineering Corps. Dams were built across both the upper section of the Ohio River itself and two tributaries, behind which vast quantities of water accumulated. The opening of these dams at the right time raised the water-level temporarily, and enabled a fleet of river barges to carry twelve thousand tons of coal down to Cincinnati, the ordinary water-level being sufficient to enable the empty barges to proceed up-stream again, ready for a repetition of the operation.

#### MORE MAGIC SQUARES.

The Hindu magic square published in 'The Month: Science and Arts' for October has induced several correspondents to send us other squares of figures presenting similar features. For instance, two correspondents (Messrs Archibald H. Finlay, and another who gives squares by a friend, Mr A. Geddes Scott) both send us the following arrangements of figures, in each of which every column, whether vertical, horizontal, or diagonal, adds up to sixty-five, yet the two arrangements are substantially different.

24	12	1	6	22
20	17	7	11	10
3	5	13	21	23
14	15	19	9	8
4	16	25	18	2
11	24	7	20	3
4	12	25	8	16
17	5	13	21	9
10	18	1	14	22
23	6	19	2	15

The sub-squares, however, do not add up to sixty-five, as in the previous example given in 'The Month.' Mr Finlay also points out that if lines are drawn between the consecutive figures, beginning at one, they form curious regular figures; while Mr Geddes has worked out a square in

which the columns each add up to one hundred and eleven, the grand total being six hundred and sixty-six. Mr William Miller sends us the following magic square, for which the total is the same as in the Hindu square given in our October issue, but with a different arrangement of figures:

16	3	2	13
5	10	11	8
9	6	7	12
4	15	14	1

This square was found by Mr Miller upon a picture entitled 'Melancolia,' by Albert Dürer, who lived between 1471 and 1528. Another correspondent, Mr Wm. M. Chorlton, points out that the figures 1 to 16 can be arranged in fifteen different squares, each having the characteristics already referred to, and he gives five examples; while Mr Lionel Davy also sends us a square made of these figures, in which the columns and supplementary squares add up to thirty-four.

#### REJUVENATING OLD ARMY BOOTS.

'One of the most remarkable factories in England is to be found in south-east London,' says *The Times*. To this establishment are sent all the old boots from the various British theatres of war, as well as from the military camps in this country. Most of these boots appear at first sight to be useless, but so long as the uppers and welts have some wear left in them it is generally worth while to supply new soles and heels. Sometimes only one boot of a pair is worth saving; but this is no drawback, as the sizes are standardised, and a fellow for it may be saved from another pair. The boots arrive just as they were taken off, many being caked with mud and containing various substances introduced by the men to ease their feet. A preliminary sorting results in the rejection of boots which have no more wear in them, while the others are cleaned and scrubbed with warm water to which carbolic acid has been added. After being drained, the leather is treated with a coating of warm castor-oil. The next process is the removal of the remains of the old sole and heel, after which new soles and heels are tacked on temporarily by hand, and the boots passed to machines which do the permanent nailing. What may be called the finishing process is reblocking, to bring the boots back to their original shape. This is done by dipping them in warm water and inserting lasts of the correct size, upon which they are left until dry. It is interesting to note that the soldiers prefer these remade boots to new ones, as they are easier to the feet. Practically all the work described above is done by women, of whom two hundred

are employed, only five skilled men being required, and these are all over military age. This interesting factory is carried on by the Army Clothing Department

#### HOW CONDEMNED ARMY BOOTS ARE UTILISED.

Even the boots which are so much worn that any attempt to repair them would be futile are by no means worthless, the leather of which they are composed being utilised in many different ways. Some of these are indicated in an interesting paper read by Mr M. C. Lamb before the London Society of Chemical Industry, and published in the society's *Journal*. Strange though it may appear, waste boot-leather, Mr Lamb asserts, has been proved to be a most serviceable material for road-making. Mixed in the proportion of from 5 to 10 per cent., according to the nature of the road, with limestone, slag, or granite, together with bitumen and asphalt, it forms a substance called, in honour of the patentee, 'Broughite.' Applied to the surface of the road in a layer four inches thick, and given a top facing of slag, granite, or limestone, Broughite forms a satisfactory substitute for wood-paving at a much less cost, being equally silent, and exceedingly durable. It is also claimed that a road covered with Broughite is quite as hard and rigid as a tar-macadam road, that the cost is no greater, and that, while the resiliency is increased, the rate of wearing, and consequently the amount of dust, are decreased. It offers a secure foothold for horses, and the cyclist or motorist need not go in fear of a side-slip on roads prepared in this manner. The Roads Board, determined to test the new material thoroughly, has had several stretches of roadway laid with Broughite, and will carefully test the results. As an alternative to this use of waste leather, it may be destructively distilled to yield about 25 per cent. of its weight of animal charcoal, useful in the purification of sugar, and about the same proportion of ammonium sulphate, valuable as a fertiliser; while the leather of boot-uppers furnishes about 15 per cent. of grease and fatty matter.

#### THE ROAD TO A HEALTHY OLD AGE.

Those who read and appreciated an article under the above title in this *Journal* for 1916 may be glad to know that the writer, Dr T. Bodley Scott, has greatly expanded the area of his observations, and has issued the result in a book called *The Road to a Healthy Old Age* (T. Fisher Unwin). Dr Scott was R. L. Stevenson's physician at Bournemouth, and the Dedication of Stevenson's *Underwoods* has a charming reference to him. Written in a popular style, the book has been prepared alike for doctors and laymen, and deals in a common-sense way with the subjects of prolongation of life; conservation of health, and the habits necessary for its promotion; food and food values; nature

and treatment of premature senility, especially arterio-sclerosis or thickening of the arteries; thyroid treatment; and chronic bronchitis and asthma. Writing mainly for folks past middle life, he recommends those over fifty to get the heart and the arteries examined to note if there is arterial tension or blood pressure; for he says a man is as old as his arteries. Another of his sayings is, a man is as old as he thinks. If he thinks old, he is old; if he thinks young, he is young. We are again told that disease is largely owing to faulty living, and the morbid symptoms of premature old age are indicated; and it is pointed out that since David the Psalmist wrote the term of life has increased, and that to healthy folk the limit of life may be nearer ninety than seventy. In the evening of life Dr Scott recommends the removal of excessive pressure of bodily or mental work, carefulness in eating and drinking, less excitement, no late hours, and plenty of quiet rest. As to vegetarianism, he points out that the flesh-eating raven is often a centenarian, as well as the vegetarian parrot. There are interesting references to those who get out of gear when they cease active duty, and about those who work till they drop, and less quickly get into a state of gradual decay.

#### A NEW MOTOR-TRICYCLE.

An auto-tricycle has recently been constructed which is likely to make a strong appeal to elderly gentlemen, ladies, and others who have been desirous of taking up motor-cycling, but have felt themselves unequal to the strain of mounting and riding a 'two-wheeler.' The motor-tricycle referred to is fitted with an engine of two-and-a-half horse-power, capable of propelling the car at a speed of twenty miles an hour, which is ample for the type of user for whom it is designed. A novel and most commendable feature is the provision of a lever by means of which the tricycle is started by the driver after he has taken his place in the large, comfortable seat, which is so arranged that it can be adjusted to his individual reach. So far as possible, the wheels and the mechanism are protected from dust and moisture, and the specially wide tires should give ample wear, and ensure a considerable degree of comfort and safety even when driving along tramway routes.

#### INTERFERENCE WITH THE 'BALANCE OF NATURE.'

The necessity for the exercise of great care in interfering with the 'balance of nature' is emphasised by the experience of Australia. Compulsory poisoning laws have been in force in the island-continent for thirty years, with the result, says a recent number of the *Scientific Australian*, that the carrion hawks, the crows, and the native carnivora have been almost entirely exterminated. As a natural consequence of this wholesale destruction of nature's scavengers, the

carcasses of dead animals are now consumed principally by blow-flies, which have multiplied so enormously that they have become a positive danger to the sheep on the runs, infesting them with their larvæ, and causing them to become 'fly-blown.' According to the *Victorian Naturalist*, mice, too, have increased to such an alarming extent that it is sometimes with great difficulty that wheat-stacks are protected from their depredations. One device that has been adopted to get rid of these pests is to surround the stacks with sheets of galvanised iron, in which openings are left leading into kerosene-tins let into the ground, and partly filled with water. By this plan it is nothing unusual to destroy in one night ten thousand mice; at one station a 'bag' weighing over a ton was secured in forty-eight hours. The damage wrought by such vast numbers of vermin must be enormous, and it is suggested that the Commonwealth should follow the example of Canada and the United States in instituting a Bureau of Economic Ornithology, which might also make investigations as to the economic usefulness, or otherwise, of the surviving native carnivora. In these days man simply cannot afford to destroy 'nature's policemen' in mistake for pests.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

#### THE PORT OF PEACE.

THOU art the port of rest  
To which I steer,  
When life is all unblest  
And ways are drear.  
Out of the mist and foam,  
The sighing sea,  
I bring my sorrows home  
To rest with thee.

Thou art my port of peace  
Whose light shines clear,  
Across the storm's increase,  
The loss and fear.  
Out of the wind's control,  
The yawning night,  
I steer my troubled soul  
To thy dear light.

ARTHUR L. SALMON.

#### \*. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

### THE WORKER'S HOLIDAY.

By BART KENNEDY.

#### PART I.

EVER since he had known anything he had been deferred to. No one had ever contradicted him, and he was always addressed with the utmost reverence. Even when he was a boy at one of the great public schools he was treated with special consideration.

He possessed many beautiful houses, and he had a multitude of servants to wait upon him. His lightest wish was anticipated and met. If he desired to see any one who was great or famous, he had but to express his desire, and the person concerned was only too pleased to obey his wish. The service of every one was absolutely at his command.

Wherever he went he was received in a splendidly ceremonial manner, and a band struck up a certain tune. Sometimes he wished that the tune might be changed; he had heard it so often. But that was hardly possible, for it was one that belonged to his coming, even as light belongs to the coming of the sun.

Needless is it to say that he could eat the finest and richest food and drink the rarest wines; the best of everything was always on his table. And if he went anywhere on a visit, his host saw to it that things were right up to the top mark.

He had numberless suits of clothes, and numberless hats, and numberless pairs of shoes. His wardrobe was very extensive indeed. In fact, he had everything that he could possibly want in that direction; and more.

He had also plenty of travelling. Indeed, to tell the truth, he was always moving about, always going here and there. His engagements were so many that he had to have them booked up a year ahead.

Some there were who envied him; some there were who wished that they were in his place. To be always treated with consideration, to have the best of everything to eat and drink, to have plenty of money and fine houses and every other good thing, seemed to them to be most desirable. Yes, there were those who envied him.

And, curious to relate, he himself envied people who were in a lower position than he was. It does not seem credible, but the fact

remains that he was tired of all his possessions and fine houses. He was tired of the continual deference that was being shown him. He wished that some one would contradict him now and then, for he was a man with a sense of humour, and he knew that it was impossible for him to be always right in what he said. It was tiresome to be always agreed with. He would have liked to have an argument occasionally. He was especially tired of the tune that heralded him whenever he arrived anywhere. He had heard it many thousands of times, and whilst there was a noble, broad, melodic sweep in it—still, hearing it so often had made it pall upon him. Indeed, one of the most pleasant dreams he had ever had was one in which he dreamt that a new tune had been invented to take its place. When he awoke he felt quite sad.

He was tired also of visiting people; tired of always being on the move; tired of always changing from one suit of clothes into another; tired of always having to tell people how pleased he was to meet them. For, though he held such a commanding position in life, he was, when all was said and done, a human being. He had his likes and dislikes, just as any one else has. Now and then he met men the shape of whose faces he did not like. But he had to make out that he considered them people of the finest and the best. He had to give them the glad eye and the glad hand.

One might think that, being in the position he was in, he would at least have had the privilege of meeting only those whom he chose to meet. But such was not the case; at least, it was not so in practice. Whilst he was really above everybody, and had power over everybody, at the same time he was not free to follow out his inclinations. He was not free to go where he chose, or to do what he chose. He was only so in theory. In practice he had to follow exactly the lines laid down by people who were beneath him in position; and, also, he had to follow the lines that custom had laid down for him. He was only free to do as he chose in things that did not matter.

His position was an anomalous one. It was in itself most contradictory. He was over every

one, he could do anything he wished, and still he could do nothing he wished. He had to follow directions in almost everything. It was the oddest position conceivable for a man to be in. And he was very tired of it. Indeed, he would not have been human if he were not.

He tried to hide this, but it was not possible for him to do so. The lines of fatigue showed in his face. And this was not to be wondered at, for the amount of work he had to do was enormous. He was constantly going from place to place, and making himself pleasant to all he met, without any exception whatsoever. To make one's self pleasant is, of course, an agreeable thing now and then; but to be forced to make one's self pleasant on all occasions is a task most appalling.

To put the matter plainly, he was a very much overworked man. He had to do the work of ten men, and to assume an air of being fond of it. He had many houses, to be sure, but he could only live in one of them at a time. He could only eat one meal at a time. He could only wear one suit at a time. To sum up, all that he got was a living for the doing of ten men's work.

Whenever he read or heard of workmen going on strike he smiled strangely. He felt that they were lucky indeed to have the power to do so. He personally could not even dream of doing such a thing. Often he thought how grand it would be if he could go on strike for a month, or a week, or even for a day! But such a thing was as impossible for him as flying to the moon. He had to keep on doing as he was told, and going where he was told.

His taskmasters were very polite, it must be said. They did not say, 'You must do so and so.' Their manner was deferential in the extreme. Their orders were couched in the form of humble suggestions; but they were orders nevertheless. He had to obey them; and he knew he had to obey them. He was as powerless as any slave. Let the truth be told. He was really neither more nor less than a sweated worker.

He had no friend; for the position he occupied made it impossible for him to have a friend. A friend, if he is to be a real friend, must be one's equal. He must be able to contradict and to chide when he feels so disposed. But this man's position was such that no one ever said to him what was really in his mind.

He was, therefore, that most forlorn of beings—the being who is alone. He was as much alone as if he were marooned on a desert island. Though he was surrounded by smiling, deferential faces, still this was so.

Like every other human being, he cherished a secret ambition. That ambition was to disguise himself and go about amongst ordinary people and listen to what they had to say. He had had it for years, but he found the realising of it

an impossibility. He broached the idea once to a man who was in a position near to him—a man whom he liked. But the look of horror in the man's face made him drop it.

Still, he always had it. Often he dreamed of it. He used to dream that he was going around, in the vast town where he lived part of his time, really free. He was talking with chance strangers. He was going here and there, going where he chose. Really free. He had shaken off the incubus of his never-ending duties. These were delightful dreams. But, alas! only dreams.

What would it be like to be a labourer? What would it be like to go out and work for one's bread in the ordinary way? How would he manage? How would he get along?

He often asked himself questions such as these. If he were to go out suddenly by himself he would be helpless. If he were to go out, unknown, and mingle amongst the millions of people, he would have a hard time. This he realised. Perhaps he would die. But, for all that, he would give his soul to be able to do it. He would like to be able to go and take his chance amongst other people. It would be intensely interesting. Vistas of which he had no conception would open out before him.

And one day the miracle occurred.

One day he found himself by himself in the great town. How he had managed it may not be told quite exactly. But there was one who was near him who had turned out to be really a friend.

He was amongst the people, going along just like any one else. No, he was not missed. For some one had taken his place. Some one had personated him. The man who had turned out to be a friend had managed everything.

And now he was going along by himself. It was as if he were in another world. He knew where he was, of course. He knew the great town in all its outer detail. But though he knew it, it was not as the town he had seen before. It was at once familiar and utterly different.

He did not feel as confused as he thought he would. For the position he occupied had developed within him the fine quality of absolute self-possession. He had learned to keep the balance of himself upon all occasions.

He passed on in the midst of the crowd; and he had the unusual and peculiar experience of having people look at him without seeming to see him. It was the first time in his life that this had happened to him. Always had there been in the eyes of those he met a look of respectful recognition. But these people neither knew him nor cared to know him. Their faces were cold and absorbed. They moved along as though they were utterly alone.

No one seemed to care for or to heed any one else. They might have been a thousand miles

away from one another. Though they were in the crowd, they were not of it.

A man with a beard was coming towards him—a man who looked at him in a puzzled kind of way. For an instant he thought he was recognised; but the man passed on. And there came a girl who was selling flowers. She stopped right in front of him, and offered him one. He took it with a smile and a word of thanks, and was passing on. But she stopped him. 'Aren't you goin' to pay me for it?' she asked. He felt awkward, for he never carried money. It was not necessary. And then it suddenly occurred to him that he had taken some out with him that morning.

He put his hand in his pocket and took out a coin. 'Here,' he said, handing it to her.

The girl looked surprised and delighted at the coin. She looked after him as he went along. 'E's what you might call a gentleman,' she said. 'Yes, 'e is.'

He heard the words, and a thrill of pleasure passed through him. The compliment was at least a real one. The girl was pleased because he had given her more than the value of the flower. It was good to feel that he had received genuine commendation for the simple thing he had done.

Suddenly there came to him the idea that he would like to ride on a motor-bus. But the undertaking presented to him a formidable difficulty. It may seem very odd to have to tell it, but he did not know what to do. The buses thundered along the street, and he hadn't the faintest notion of how to get aboard one. Of course, he had often seen them going along the streets, but it had never occurred to him to notice how people got on them. What he would like would be to ride on the top of one!

He went on, and—well, there was a bus that had stopped at the kerb just by him! People got off it, and then people got on, taking their places. Why, the whole business was absurdly simple. All he had to do was to follow the people who were mounting the steps to get on to the top of it! To think that he had been puzzled by an arrangement that was so extraordinarily simple made him slightly vexed with himself.

He was on, the top now, and the bus was shaking and rattling along. The sensation was fine and exhilarating. He enjoyed it very much.

'Fare, please,' said the conductor, tapping him on the shoulder in a somewhat authoritative manner. No one had ever spoken to him or tapped him on the shoulder in this way through the whole of his life. It was a new and very strange experience. But he liked it. He felt now that he was just like any one else; he was really one of the people! He handed the conductor a coin.

'Aven't you anything smaller?' asked the conductor, handing it back to him.

Smaller? Oh, yes, he understood. He gave the

conductor another, a silver one. And he received a ticket and many copper coins in exchange. What the ticket was for he did not know. But after a bit he knew, for somebody else came and asked to have a look at it. He was getting on, he felt. He was rapidly acquiring new knowledge.

'It's a nice day, mate,' said a man to him. This man was sitting next him on the seat that did not seem to be quite big enough for two people. He was roughly dressed, and his hands were grimy. A workman, evidently. It was the first time he had ever sat so close to one of the real people; but it was part of the new game into which he had entered.

'A very nice day,' he answered. 'Quite a nice day.'

The workman looked at him. There was something in his tone that pleased him. The workman was not aware of the fact that the profession of the man who was sitting next him was that of pleasing those with whom he talked. They got into a casual conversation, and the workman was more and more pleased. When he was getting off the bus he held out his grimy hand. 'Good-day, sir,' he said. 'Pleased to meet you.' 'A nice gentleman,' he said to himself as he was getting down the steps at the back of the bus.

The bus had stopped just at the corner of a great square wherein was a vast, high column, on the top of which was the statue of a famous admiral who had been dead over a hundred years. From the top of the bus the square presented a most magnificent view. This square was certainly one of the finest in Europe; but it seemed to him as if he had never seen it at its best till now. It was filled with sunlight. It was indeed a grand place to see!

He turned and looked behind him to see if any one was following him. One of the things that he did not like about the exalted position he held was the fact that detectives invariably followed him about to see that he was safe—that he came to no harm. It always irritated him whenever he saw one of them.

No, there was no one following him; of that he was certain. His friend had kept faith with him. He could tell a detective a mile off. It was glorious to feel that no one's eye was upon him. This was a grand outing that he was having. He had never enjoyed anything so much through the whole of his life.

All sorts of strange and odd ideas were coming to him. And he felt an indescribable elation. Through the whole of his life he had been a prisoner. He was as much a prisoner as any criminal who had ever been sentenced by a judge. His chains were beautiful chains. But they were chains nevertheless; and it was in his mind to break altogether with the whole business. Life was worth nothing if a man could not be free. People were always talking

and writing about the wonderful gift of freedom. And it really was a wonderful gift. It was worth more than life itself. He had never really lived till now. How fine it would be if he could always go on as he was going now! What wonderful experiences he would have! He would enjoy life in the fullest way imaginable. The sum of life, after all, was the sum of experience. A man who was committed day after day to the same round was a man who did not live in the real sense at all. The fact that the round was a round of ceremony and show meant nothing. Such a life, when all was said and done, was only the life of a slave. And there came to him a sudden resolution to break himself free of it altogether.

But he could not do this! For he had pledged his word that he would meet his friend at a certain place at the end of the day. It was only on that condition that he had been helped on the way to the adventure he was now enjoying. He had pledged his word, and he could not break it. The bus arrived at the broad, open gate of a certain great park, and he got off.

Suddenly he felt very hungry. He had been so excited at the prospect of his coming adventure that he had eaten practically no breakfast that morning. And now he was very hungry indeed. He would have to get something to eat. But where? And how?

He would have to go into a restaurant, of course. There were restaurants all over the great city, and all he would have to do would be to go in and order food just like any one else did. It was a simple thing to do. Just as simple as getting on to the top of the bus.

But he felt at sea for all that, for he had never been in a restaurant by himself. And

then there came to him the remembrance of how he had roughed it once years ago. But that experience seemed to him now to be a very long way off indeed; and, besides, he had only roughed it in a manner of speaking—for there were others with him. Still, the remembrance gave him confidence, and he turned to his right and went down along the left side of a great, busy street.

He felt very hungry indeed, and he determined to turn into the first restaurant he saw. Here was one! All sorts of eatables were in the window. There were slices of bacon and eggs, and loaves and cakes, and tomatoes, and chops, and kippered herrings, and a round of beef that looked slightly discoloured. Flies were also in evidence. He did not like the appearance of the food. But he was awfully hungry, and after looking through the window for a moment, he decided that it would do. But he hesitated about going in.

Again he looked at the food, and he smiled. There was no mistaking what the food would cost, for the price of each article was plain to be seen. Everything was absurdly cheap. An egg and a slice of bacon were displayed on a plate, and a metal ticket, that was stuck in the bacon, told the tale to the effect that both could be had for fourpence. A kipper was twopence, and a portion of haddock was twopence. A cup of tea or coffee could be had for a halfpenny; and so could a slice of bread. A chop was sevenpence. And so on. All the articles of food were marked with the exact price. The longer he looked through the window at the food, the more did he feel that it was appetising. Finally he walked in.

## EFFICIENCY.

By E. FEARON.

IT sometimes happens that an ultimate good may result from an apparent evil, and although at present it is difficult to see anything but the evil of the war, and appalling though the loss of life and the suffering it has caused undoubtedly are, yet a great deal of good may ultimately come of it all. We see this to be so almost daily in minor cases. Reforms are badly needed, say, in some particular trade, but those at the head of affairs will not take heed till some terrible accident happens; then there is a great hullabaloo, everybody is aghast, and, hey presto! that particular reform is carried out with all possible speed. On a gigantic scale, this is what has occurred to civilisation in European countries; and now that the explosion has actually taken place, we ought to do all we can to repair the damage, and try to avoid such a catastrophe in the future. And, certainly, the more knowledge

each of us can acquire, not only of our own special business, occupation, or profession, but of human nature and the world in general, the better it will be for every one. As a nation we have had a somewhat rude awakening in the last three and a half years, and although, under the stress of national peril, we have certainly performed miracles in the way we raised an army, despatched it to almost all quarters of the globe, financed our Allies, and provided them with guns and munitions, one cannot help wondering whether, after the danger is past, we shall remain awake, or think we deserve a rest, and go to sleep again.

The question we have to ask ourselves is, Are we efficient, is each of us doing all he can, or are we getting through the day with the least possible trouble, and heaving a sigh of relief when evening comes and we cease working? If

we are strictly honest with ourselves, only a very small minority can aver that they are using every ounce of energy and resource they possess in their daily task, whatever it may be. Here and there one knows of some one who, for reasons of ambition, or for sheer love of it, works 'like a nigger,' as the saying is; but most of us could, without any great effort, do at least twice as much, if the incentive were there. But there's the rub! Man being, generally speaking, a lazy animal, he will only put his back into his work when the spur of ambition or hunger induces him to do so. Let us start with the workman as being the largest class of the community. He has built up a huge organisation in trades-unionism, which, like most things human, has its good points and its bad ones, and its bad ones are very bad, and lead to a great deal of inefficiency, and waste of time and effort. One of its axioms is the standard rate of wages. No doubt there is a good deal to be said for it, but look where it leads. An employer has, say, half-a-dozen joiners, if you like, by way of illustration. Four are good workmen, to whom a job can be given with the knowledge that it will be well done, no time or material will be wasted, and no great amount of supervision required. Now the other two may be quite decent men, but their skill may be inferior to that of the others; they cannot turn out as good work, cannot work as quickly, or make the most of the material supplied them; yet all six must be paid the same rate per hour or there is trouble for the employer. What is the result? Simply that the pace is reduced to that of the slowest; and, really, what else can be expected?

Look at it from the workman's point of view. Assuming that A is an efficient workman, possesses good tools, knows how to use them, and works his best from Monday morning till Saturday noon. At the end of the week he receives his wages in payment of the work done. B is a sloppy sort of individual, whose tool-box is by no means full; he is not particularly efficient, and therefore has to be kept on inferior work, needs a good deal of supervision, and altogether he is worth at the outside about 75 per cent. of A, but at the week-end he receives the same remuneration as A. Now A is not exactly a fool, and unless he hopes some day to become a foreman, or to start for himself, he is very apt to put two and two together, and do about the same amount of work as B; and can any one blame him? But as this goes on more or less in every trade, the effect throughout the country is enormous and the results are very far-reaching, if we take into consideration the number of men employed. Is it not time this sort of foolishness was stopped, and men paid in proportion to their skill? We should then see them striving to do their best, so increasing output, and gaining greater efficiency all round.

Take another question, that of scientific con-

trol of industries. Surely we ought seriously to make it our business to put this particular matter right! Research-work on a gigantic scale is urgently needed, not only in the chemical trade, but in the steel and iron industries, in manufactures such as those of glass, pottery, fireclay, and many more; agriculture needs science to show farmers what can be done to secure better results by the increased use of proper fertilisers, by the sowing of disease-resisting crops, and so on. In fact, there is scarcely any trade or industry that could not be made more efficient if we went about it in the right way; but we must have men educated on right lines, and men trained to handle big affairs, if all this is to be done. The question of the remuneration of chemists and scientists is one that must be settled in the near future, for, after all, 'the labourer is worthy of his hire,' and no parent can be expected to give his son an expensive education, and perhaps pay a heavy premium, and then find that all he can look forward to is about £3 or £4 a week. 'Rule of thumb' has reigned far too long in Britain, and the few enlightened manufacturers and others who have discovered what scientific control, good relations between master and men, proper lighting and ventilation of workshops, and so on can do in the way of increased output and increased profit are reaping the benefit of their foresight; and this could be the case throughout the whole country if an efficiency campaign were started in the right quarter. But we want the men in Parliament, the men who are supposed to guide the destinies of the Empire, to govern, and not waste their time in debates that lead nowhere, in undignified squabbles, in Royal Commissions that make reports of which no notice is taken. Here, if anywhere, efficiency ought to be the watchword; here, you are led to believe, are many of the picked brains of the country, elected by the people to show them what to do and how to do it. But what do you find? Is there anything so utterly wearisome as listening to a debate in the House of Commons? The few members present are generally listless and sleepy, and the efficient governing of the country seems to be the very last thing to be expected of them; precedent, red tape, humour of the schoolboy order are all very much in evidence, but the reason for which they are presumably met together is not at all apparent.

The pass to which we have come, due to shortage of labour, high prices of most things, and an absolute lack of others, has at last forced us to look into the reasons for this state of affairs; and Parliament has found, somewhat to its astonishment, that the people were only too willing to be told what to do. The partial closing of public-houses, liquor control, control of railways, engineering work, and coal-mines, have all been effected without a murmur. Even

the so-called Daylight Saving Bill had been discussed for years without result, as if some terrible catastrophe were going to take place in the event of altering the clock; but nothing serious happened in May of 1916 when it became law, and every one wondered why all the pother had been raised. And are there not plenty of other reforms which would make for efficiency—reforms which every man outside a lunatic asylum would welcome? Look at our ridiculous weights and measures, and our coinage. Try to estimate the waste of time and energy that takes place whenever an article is bought or sold, when almost every trade has its own peculiar method of reckoning. The whole system, if it can be called such, is a jumble that ought to be scrapped at once, and the scientific metric system introduced in its place; it only requires Parliament to say the word, and the public would acquiesce, as they have done in other matters. The Labour Bureau is another piece of machinery which, if properly handled, might be of great benefit to the community, but at present is nothing but a farce. Who, except in an emergency, applies to it for labour?

Housing reform, town planning, canal traffic, and a stock-taking of our whole resources are vital necessities which ought to occupy the attention of our leaders when peace is declared. The use of raw coal ought to be prohibited after

the lapse of a few years. Could we estimate the sickness and deaths that are due to fogs and smoke in our large towns we should be startled out of our lethargy; but, so far, scientists and medical officers of health have been 'voices crying in the wilderness'—the wilderness of official apathy, that only asks to be let alone to continue its dreaming. But what can be expected when we consider the men who are elected to our town councils, county councils, and Parliament? No doubt there are plenty of good men among them; but is any one rash enough to assert that the majority are able to discuss *intelligently* the problems that confront them, or even dimly to understand what a different place this country of ours might be if *some* only of these various reforms were brought about? If the educational level of the whole people were raised to the height it ought to occupy, intelligent debate and criticism would follow as a matter of course, and such puerile scenes as so often occur, and which bring into contempt our whole system of government, would become impossible.

When peace comes, efficiency will be more than ever necessary, and it is a national duty for each of us to do what in him lies to make himself as efficient as possible, for in that way the awakening we have had may not be in vain.

## THE FORESTER'S GIRL

By Mrs W. F. IRVINE BELL, Author of *John Pardon's Choice*, *Ole Cam'ron*, &c.

### CHAPTER V.

'IT should dry out all right now, I think,' remarked Gavin Barrie, giving a final tap with the back of his knife upon the tacks with which was fastened to a smooth, wooden 'shake' the raw skin of 'Bob's' gray squirrel.

'What are you going to do with it?' asked Kenneth Grey, looking up from a medicine-chest, in which, with a somewhat worried expression, he was searching.

'Oh, that girl seems to want it,' replied Barrie carelessly, then continued: 'Must you really go over to see that kid again this morning? What a bally nuisance it is, Ken! I thought I had succeeded in dragging you away from all that sort of thing.'

'Can't be helped,' replied Grey. 'And it's worse for the poor youngster. Don't like the look of his arm, and the mother hasn't a grain of sense. But don't let me mess up your time, old boy; better try the Rubicon, and not wait for me.'

'No,' said Barrie. 'I'll get my gun and "Bob," and walk along the trail with you. I can keep up with that nag of yours most of the way, and you will overtake me again on your

return. I want to have a look round for those birds they call "grouse" out here.'

'Right-o,' assented Grey; and the two made their way to the rough but solid log building, stable and barn combined, where the horse assigned to the doctor's use was finishing his feed of sweet-smelling hay from the meadow-clearing.

Groping their way between the rows of close, ill-lighted stalls, Grey took down saddle and bridle, while his friend untied the horse, and presently heard a sharp exclamation and smothered groan from the dark corner whence Gavin was backing the big brute.

'Hello, Salamander! what's happened?' cried Kenneth, throwing down the saddle, and hurrying to where his friend stood leaning against the stall, looking rather white.

'Stupid ass that I am,' sputtered Gavin. 'I've let this great hulk trample on my foot. Dare say it's nothing much,' he added, hobbling out into the light. 'It's swelling a bit, though. Fancy that knocks my "grouse" expedition on the head. Dashed nuisance!' he exclaimed wrathfully. 'You must think me an awful ass;

but that beast has a hoof like a mastodon, and it's pitch-dark in there. But don't you bother about me, Ken. I'll make tracks for my tent and get off this boot before it has to be cut; we mustn't squander shoe-leather in the wilderness.'

The doctor, however, insisted upon seeing the injured foot, and then, assuring Gavin that all it needed was rest, finished saddling his horse and made off for Silver Creek.

'Rest! Rest!' grumbled Gavin. 'That's an attractive prescription, Dr Grey, and the very *last* one I mean to take,' he added with vicious deliberation, then grabbed up his gun, extracted, by means of a reiterated whistle, his dog from the glories of a rubbish-heap, and feeling, as he muttered to himself, 'a blooming idiot' with the maimed foot in a moccasin, limped away towards the corral and the salt-lick. 'Wish I could see a deer. I'd take a crack at him, laws or no laws, just to spite this d—d thing!' he thought to himself, and setting his teeth against the pain now throbbing in his foot, hobbled along through the deep, red dust, past the corral, whose high 'snake fence' seemed still to pen in the rank odour left by a recent multitude of Angora goats, and so into the forest.

Not far, however. Grey's Bucephalus was no light weight, and the iron-shod hoof a very unequal match for even the strong will of a pain-despising young Englishman. Unconfessed, Barrie was none the less glad to come speedily upon the salt-lick—a log, bare of bark, its upper side hollowed at intervals and partially filled with salt. Round and about this log the thick dust lay, still heavy with the night dew; and Barrie, with the true hunter's instinct, began carefully searching for the graceful impress of deer's feet. There they were. This large, deep 'heart' must have been left by a goodly stag, and these lighter ones by a doe, or possibly several. Although common-sense told him that these shy denizens of the forest would, even at this early hour, be far away in the sun-filled hollows of the neighbouring cañon; and although, even did one appear, nothing would tempt him to fire, he nevertheless instinctively gripped his gun and his pulses leapt with unwarrantable anticipation as a slight stir among the sweeping spruce-boughs and a faint crackle of pine-needles reached his quick ear. Intently following the direction of the sound, he presently detected a pair of large dark eyes peering through the network of green. Not those, however, of a half-expected deer, but of the girl, Anita Lalonne.

At sight of her a feeling of intense annoyance possessed Gavin Barrie. The last thing on earth that he wished at that moment, nerves all on edge with pain, as they were, and a desire above everything for the soothing silence of the woods, was to have this young woman again attaching herself to him; and although he at once dismissed the thought as ungenerous, it none the less looked as if she had seen the departure of

Kenneth Grey alone, and had followed his friend hither. So, barely lifting his hat, he slung his gun across his arm and moved away, unpleasantly conscious that, despite his best efforts, a limp in his gait was all too obvious. The red-brown dog, however, who, after the manner of his kind, once a pact of friendship had been sealed, knew 'no variableness, neither shadow of turning,' rushed up to Anita as she emerged from the trees, but instantly dashed away again on the scent of some beast, master and dog soon disappearing in the thick bush.

Anita, whose face had brightened at coming upon an acquaintance in what, albeit only a few yards from the station, was, for her, a first venture quite alone beyond the limits of the clearing, felt a pang not only of disappointment, but also of resentment, at the prompt departure of the Englishman. Had he been one of the forester's friends she would not have hesitated to call, 'Coo-ee!' or on light feet to pursue him with teasing jest. But Anita Lalonne knew enough of the world to realise that Gavin Barrie was a 'cut above her,' as Dave Hardy would have expressed it, and such a freedom was not to be thought of.

Since their excursion together the previous morning beside Bear Creek, Anita had scarcely come in contact with Barrie. Indeed, from the moment that he had again forded the stream with the girl in his arms (carrying her, so she could not but feel, for much the same reason as he carried his dead trout—because she could not swim for herself), and, setting her down, had started silently up-stream again, they had seemed to Anita to be more than ever strangers to each other. 'If only he *knew*!' she had kept saying to herself as she picked her way far behind him lest she should again interfere with his line, which from time to time he dropped in a more than usually tempting pool; but except for a few remarks about the wild gooseberries growing beside the steep path up which they finally scrambled, nothing had passed between them until they reached the Grizzly. Then Gavin had said, 'I will keep the squirrel and skin it for you, if you like,' and had not waited for her thanks before hurrying away to find Kenneth Grey and discuss with him the morning's catch.

After dinner—a hot, steaming meal, the midday sun pouring full upon the cabin, and countless flies besieging food and feeders alike—Anita, reacting from the tonic of the pine-laden air to an exhausted weariness from the previous day's journey, had retired to her room, and for many hours slept a sound, dreamless sleep, waking only just in time to dart apologetically into the cabin dining-room, after every one else had finished supper, and to receive a good-natured scolding from Mrs Axel for eating a half-cold meal. The two Englishmen had already gone off for an evening stroll and a smoke; and Anita, after loitering about in the faint hope that David

might chance, after all, to come, had again, as soon as darkness fell, sought her bed.

So it was a wholly refreshed, light-hearted girl who, with renewed strength, and consequently more courage, had inaugurated her second day of forest life by venturing alone into the great, silent woods. 'There's nothing to be afraid of. Won't you believe me?' With these words of Gavin Barrie echoing in her mind, her tiny hand clenching one of Charlie's big sticks, her black hair bare to the sunshine, her eyes and cheeks glowing with a half-fearful joy of what might be in store for her, she had started on this *petit voyage* with all the thrill of a pioneer, and in less than five minutes had come upon Gavin Barrie himself, only to see him almost instantly take himself off. For a moment Anita stood hesitating, but at heart she was no coward, and the lure of the wild had already begun softly to call her. Of course—so she said to herself—she would not go far; retreat a few steps and she could still see the low, sharply pitched roof of the station stable; while facing her, no great distance beyond the salt-lick, the edge of the forest, abutting abruptly on the lip of Rubicon Cañon, revealed a tempting background of sunny blue sky. Yes, she would venture just that far; would sit down under that amazing tree of gigantic proportions and write to David, Mr Axel having said that those men would be returning to-day, and could take a letter in to him. With her she had brought several sheets of paper, for there would be so much to tell him; but when once seated comfortably on the warm, dry ground, the great tree-trunk at her back, and sunshine enveloping her from head

to feet, Anita's pen lay idle in her fingers; there was no need to hurry, and, oh, the wonder and the beauty of this vast amphitheatre stretching away from her very feet to the far purple heights beyond!

Anita's eyes, long accustomed solely to the dull, dingy perspective of tram-ridden streets, to unlovely, unlovable walls of brick and board, her only knowledge of open spaces the trimly kept, man-controlled parks of town or village, felt her head swim and her soul expand in the presence of the immeasurable handiwork of the Great Landscape-Gardener.

Yes, the Englishman was right; here, indeed, from so deep a cup of sunshine might she drink without fear. What a foolish coward she had been! All the sunshine of all the world seemed poured into this glorious chalice. Was David's home perched on the rim of such a one as this? David's home! Her mind caught at the familiar word; a tremulous smile dawned upon her lips; her eyes grew dreamy. Yes, she could think of it now as 'home,' that far spot in the wide wilderness where she and her forester were to live as man and wife; and yet how few hours had passed since the mere thought of having to dwell indefinitely among the awesome shades of the big timber had filled her with terror and aversion! What was the leaven working in her mind? 'There's nothing to be afraid of. Won't you believe me?' Ah! that was it. The Englishman had assured her there was nothing to fear, and she could, and did, believe him. Well, now she really *must* write to David.

(Continued on page 89.)

## A NIGHT ON THE EDGE OF EUROPE.

By R. COURTIER-FORSTER.

IT is early evening, after a day of wild wind and storm, and the little, tub-like coasting-steamer, with her motley medley of human cargo and kerosene-casks, struggles inertly in the boiling, foam-spattered waters of the angry Euxine. The ship does not so much make a way through the heaving billows as over them, tossed like a bung from a barrel.

The waves lash and hurl themselves in disdainful fury about the little vessel. She rises as they rise in seething volume, and sinks into the well of the gray, smooth valley of hissing foam as the thundering hills of water fall sullenly away to give place to the next onrushing of the furious sea.

Out of the ashen-gray arc of sky a sudden blaze of jagged, flaming sunlight just above the horizon strikes the line of coast, turning the murky, towering cliffs a mellow golden-red. They are fringed below with line after line of soft, white surf shining in the light of the sunset

like rows of pearls about a blushing woman's throat. It is the fringe of the great Bay of Odessa, which sweeps in a graceful curve for twelve miles from point to point; the bay where long centuries ago Greek triremes passed with billowing, flower-like sails, to plant new colonies on the fringe of the rich and vast lands which stretch away from the drowsy palm groves of the Caucasus and the vine-streaming hills of the Crimea, through cooling, illimitable plains, to an ice-sheathed north, a legendary land farther than the imagination of those days could reach.

Here, too, great Roman galleys sailed by, in stately power and pride, to levy tribute on the haughty kingdom of Pontus and far-distant states, after the rivalry of Carthage was crushed into the ruins of a dying continent. And then in later days the empire of Byzantium sent fleets of adventurous merchantmen over the wild Euxine Sea to bring back corn and wine and costly furs to grace the feasts and lovely pageantry

of the splendid and luxurious Byzantine Court. Long, long ago the ships faded into the crimson waters of the sinking sun, a sea of agate flashed with rubies, leaving the Russian lands for the last time. They carried their rich burdens up the Golden Horn to the distraught Court of the last Christian Emperor of Constantinople, and the Russian ports knew the imperial fleet no more. A few years later the Bosphorus vomited forth strange great ships afresh, with the stalwart, handsome Byzantines replaced by wild and dark-skinned foes, the ruthless destroyers of Byzantium, the fierce creators of Stamboul.

Our little, storm-drenched vessel glides into the smooth waters of the grand harbour of Odessa Port like a soul saved from the fury of all the dead empires of the Euxine Sea. Above, the great cliffs rise steeply for a hundred and fifty feet, the broken edge of Europe fringed with a glimpse of vivid green, the last extremity of the vast Pontic steppe.

Beyond the masts of countless ships rise the ascending tiers of social life. First the grim, gallows-like elevators, immobile in the coming gloom, and warehouses full of mystery and darkness. Then, higher, sleeping-houses, where the derelicts may for a few copecks spend the night in rows, like a living cemetery, each man in a spacious coffin to himself. Near by are seamen's lodgings, steam-baths, and mean shops. And on the tree-crowned heights the stately façades of nobles' palaces and brilliant boulevards are still shining in the last glow of the blood-red flare from the gash in the sunset sky. It is Odessa, the European magnet to which the Eastern loadstone clings. Those who come to it from the West find here the fringe of the Eastern world; those who come to it from the East meet the beginnings of the West.

The storm died when the light of the setting sun tore the gray cloud-banks apart and flashed on the sandstone cliffs. Each minute the night deepens with a peridot light spangled with stars. The air is full of the faint perfume of acacia-blossom from the thousands of flowering trees which transform the city for a few spring weeks into a sweet-scented vision of white loveliness. The very pavements are covered with drifts of fallen petals, a summer's snow.

Outside the massive harbour gates rough cobble-stones stretch darkly, with many pitfalls for the unwary, to dim, noisome streets that ascend to the upper town—streets that in the cloud-bursts of the summer thunder-storms become roaring watercourses, where torrents hurl themselves with hissing defiance over every obstacle, carrying before them all the discarded garbage and straying babes of the quarter, and forming a wide lake without the harbour gates, some three feet deep, drowning the evil smells and derelict cats, and giving cause for many deeds of knightly gallantry.

From out of those well-worn cobble-stones a

stout pavement rises steeply, high above the roadway, like a miniature sea-wall. Beyond this causeway four or five worn stone steps lead down into strange, odoriferous little shops which shun the light of day, sepulchral places of mysterious happenings. The heavily barred windows in dim colour-washed walls are faintly visible through the gathering darkness. Closely fastened shutters show here and there a narrow crimson gleam contrasting furtively with the cold white light of the rising moon. One door stands open, and a yellow flood of garish brilliance falls on the steep stone steps. A gramophone which has seen better days is blaring an air from a Russian opera with raucous huskiness. A sailor of the Black Sea Fleet comes out and stumbles up the steps. As he passes through the narrow circle of light into the darkness, the full, mocking laugh of a woman follows him into the gloom, and the door is slammed.

It is a quarter of disquieting night-sounds, followed by alarming silences; a place of dusty, dirty, evil-smelling darkness, with its few secretive shops where furtive iniquity makes its lair. Here are many taverns, now ostensibly for tea, whose brightly curtained windows announce various beverages in every language in Europe save German, and some from the East as well. A smudge of black paint hides the German words.

A narrow, cobbled street of appalling steepness, with the appearance of a ruined bed of a dried-up watercourse, straight as a ladder, unfolds a way towards the stars and the upper town. Dim figures in bell-shaped cloaks and high fur hats are ascending and descending past others in sheepskin coats and heavy top-boots, mingled with a stream of soldiers and sailors. At the end nearest the stars is a different world—the edge of Western Europe; wide streets and tree-lined boulevards thronged with automobiles and carriages bearing their daintily gowned occupants to the opera. A town of brilliantly lighted shops and crowded cafés, of theatres, cinemas, and smart hotels.

In one of the chief cafés a string-band is playing a lively mazurka. The place is crowded with people. It is a very smart Russian café, with its fittings, people say, copied from the saloon of the ill-fated *Titanic*. The place is popular with the feminine section of society for many miles round. The lights are said to be most becoming, and are shaded in rose-pink and gold silk. No man is admitted to this paradise unless he be either in uniform or accompanied by a lady. A strange rule, but it is rather a strange place. The uniforms seem to be taking full advantage of their privileges. In a corner a group of trim, buff-clad Serbian officers, with high crimson-velvet collars, are drinking champagne and talking Serbian in loud tones, their dark eyes flashing with animation. The prohibition of the sale of wines was withdrawn

in the southern Russian governments after a very few months' trial. Beyond the Serbians is a family party of Poles, drinking tumblers of *café-au-lait* and eating little cakes of honey and nuts. With them are two Polish students, with the silver buttons put so closely together down the front of their blue uniforms that they look rather like page-boys. In an alcove two Russian officers are entertaining two French actresses from the town theatre to dinner, and the orchestra is unable to drown all the light French phrases and laughter that float out into the crowded room. European waiters flit from group to group. Notices on the walls request you not to speak German; there is a fine of two thousand roubles for transgressors. Some Rumanian refugees have met a party of English acquaintances, and insist on two tables being joined together.

Suddenly a very elaborately dressed lady of nebulous age but youthful complexion enters, carrying a turquoise velvet shield stuck all over with little red papers bearing various numbers in yellow. She is attended by a very young officer carrying a blue tin money-box. Something like a sigh of resignation sweeps over the assembly. Every one knows, from countless previous experiences, what is about to befall him. All pretend not to see her, and to be deeply engrossed in eating or drinking or talking; but the lady is nothing daunted. She moves smilingly and systematically through the room, pinning a red-and-yellow number on to every man present. The young officer comes after her with the money-box and an apologetic expression. He is received coldly. The lady whispers confidentially, with a gleaming smile to the men, that the little bits of paper are the numbers of Russian regiments, the offerings for the children of the regiments. She has a large and all-embracing heart; the whole Russian army seems represented. Her departure leaves us looking like a crowd of ticket-of-leave convicts. The string-band strikes up a selection from *Prince Igor*; a babel of tongues—Russian, French, Polish, English, Rumanian, and Greek—mingles with the rustle of silk, light laughter, and the clatter of china and glass. This is the last resort of the Western world, the edge of Europe. I pass out into the night to visit the beginning of the East.

Next door I see through huge plate-glass windows the brilliantly lighted café which is the favourite haunt of the Jews. It is crowded with a keen-eyed, vociferating mass of black-coated figures conversing in Yiddish. This is the notorious rendezvous of the Jew merchants, raided by the police on a recent Sunday afternoon to capture the ring of food speculators who were forcing prices up to famine-point. The local press gave graphic and gloating descriptions of the distracting and most unsabbatarian happenings.

As I turn out of the great main thoroughfares the streets become less crowded and more dimly lighted. A narrow byway, dark with heavy-foliaged acacia-trees, shows latticed Tartar windows high in the dim white walls and trellised balconies. In the street of the Greeks the windows of the public billiard-rooms flood the pavement with hot light, and little dinner-shops announce the dishes of the *Ægean* islands. In the 'magazine' attached to one of these the shelves are lined with graceful glass jars of Hellenic design, filled with rose-petal jam from the Caucasus, and shelled walnuts preserved in sweet syrup of a golden hue. Here are rows of little, clear glass vases containing sherbet of many colours and flavours, rose and white, and pink and yellow, and some the shade of moonlight on a shell of pearl. Trays of frothy sherbet biscuits and Mitylenean honey-cakes stand by the curtained doorway through which the so-called restaurant is entered.

It is a lofty, dingy room with a repulsive floor, and unappetising stale walls ornamented with bright, untruthful, coloured prints in narrow black frames suggestive of the undertaker. One represents the seven stages of the life of man in the descent to hell; the other, the seven stages in the ascent to heaven. Both are highly instructive and full of graphic detail. The icon in the corner of the room is merely a concession to the religious susceptibilities of the majority of the frequenters. It is dusty and uncared for, the lamp before it dirty and unlighted. The proprietor's whole attention is devoted to seeing that none of his guests overstep the bounds of controversy and bring their mutual hates and antagonisms to the point of the knife. A strangely garbed and motley company almost fills the place. It is a scene odorous of the Orient and hazy with the smoke of countless cigarettes. Both serving-men and served look as though their clothes had descended through several stages of misfortune before they found themselves on the backs of the present company.

Just inside the door three Greeks, with pale faces and classic features framed in thick black hair, are gobbling mussels in a bright-red sauce, not entirely without noise, and bending over their plates in attitudes of bacchanalian adoration. In whistling whispers they are discussing such politics as it is necessary to discuss in undertones. At the little table next to them a handsome young Cossack, in a close-fitting claret-coloured coat, with a row of silver-tipped cartridges across his breast and a huge dagger hanging at his waist, is seated with a pretty peasant girl. His hair is brushed in Cossack fashion into a great coil over the left eye, and the rest of the head closely cropped. The girl has a green-and-yellow handkerchief folded over her head, and four or five necklaces of amber and coral and turquoise-blue beads over her full-sleeved, heavily embroidered bodice of magenta

and black. She is looking coyly, with down-cast eyes and an amused smile, into her tumbler of pale-brown tea. Her companion is watching her with clear, blue, laughing eyes, and whispering across the table in a persuasive manner.

Behind them some impassive and gorgeous Tartars are playing draughts in solemn silence, with all their attention concentrated on the game, and tiny cups of unheeded Turkish coffee growing cold at their elbows. They are wearing the full, flowing, open robes of bright-coloured silk, and little, tight-fitting caps of finely embroidered, bright-hued velvet. In all the clatter and movement about them they remain immobile and undisturbed, wanderers who have reached the end of the Eastern world and are careless of the edge of the West. A noisy party of university students, in their gold-buttoned uniforms of light and dark blue, are having supper a few yards off, and stopping every two or three minutes to smoke a long, thin, pencil-shaped cigarette before they resume their eating again. They talk in loud, excited tones all at once, and with a disconcerting generosity of gesticulation. A stranger might suppose they were quarrelling violently, but it is as likely as not to be a friendly discussion on the abolition of religion or the merits of the metric system.

Russo-Bulgars from the Bulgarian village settlements of the Kherson government are present in the background, with dour and heavy-looking faces, suspicious of unfriendliness. They have protested their loyalty to the Russian Government, and been believed; but they are not quite sure other Russian subjects believe them, and they look sulky. At the far end of the frowsy room some dark-skinned, high-cheeked Gruzinians are eating a Caucasian *schyslik*, with copious helpings of eye-stinging chopped onions and fennel. A couple of almond-eyed Kalmucks are watching them greedily as they sit sharing a bottle of cytro and rolling themselves cigarettes of vile mahawka tobacco. The Kalmucks have come from Russian Central Asia, and wear a kind of short dressing-gown, reaching to the knee, in vivid green and puce, over a full-fronted yellow shirt and white trousers tucked into high top-boots. Their waists are encircled with embroidered cloths. One is black and turquoise-blue, with a fringe of silver. Their knowledge of Russian is so scanty that they have difficulty in making their wants known to the waiting lad in the red blouse and sockless, sandalled feet.

Some Armenians are loudly cursing Turkey in four different languages to a mild-eyed, attentive Little Russian with a halo of pale-yellow hair and an open-chested shirt, embroidered down the front and round the neck with mythical red and black birds pecking at each other's tails. He wears his baggy peacock-blue trousers tucked into carefully polished, shining top-boots, from which protrude, besides his legs, the top of a borch spoon, a note-book, and a packet of

cigarettes. A Polish Jew, in a long, tight-fitting black coat reaching to his heels like a cassock, is sitting in a corner reading a Yiddish newspaper. He has a little, carefully oiled curl hanging down in front of each ear, and a black skull-cap on his head. He is neither eating nor drinking, and the little table before him is bare. He sits on alone and undisturbed, with a background of Podolian peasants and bronzed, stalwart men from the Black Sea Fleet. It is a variegated company, full of unfathomed passions; a conglomeration of races who hate, and squabble, and hope, and weep, ever fanning and keeping alive the flame of their racial feuds and differences, needing but little to stir them into a conflagration of mutual horror and destruction.

The windows are open to the clean night-air, but the room is close with the heat of humanity and cooked food, of unwashed linen and native tobacco. It is the meeting-place of East and West. I go out of the heat and clatter into the night.

Near by the soft moonlight bathes the silent, deserted wooden stalls of the peasant Lace-Makers' Market in silver light and ebony shadows. The great white tower of the Pokrovskaya Church and its pea-green domes keep silent watch over the market-place in the sleeping gardens. A night-watchman spins his rattle through the stillness, and is answered by another, who smites an iron lamp-post three ringing blows with his heavy stick. The next street, dark and deserted in the mysterious purple night, leads into the Old Bazaar, the remnant of the Tartar town, where a jumble of strange walls and crooked houses crouch beside ancient pillared porticoes. Buildings of white and rose and blue and yellow stand at queer angles, jostling the wooden booths and galleries of this old market-place. Here, in the black shadows of silent, odoriferous cut-throat alleys, little ruby lamps are burning before the icons of the market, and stray pariah dogs are slinking by in search of some discarded fragments in a forgotten corner.

Suddenly, at the top of a flight of outside stone steps leading to a door in the second storey under a crazy, overhanging roof, an entrance is thrown open. A wide shaft of yellow light streams out into the moonlit bazaar, and a party of revellers emerge in long, full, sheepskin coats; while deep musical voices within are heard singing the haunting, elusive chorus of a plaintive Ukraine folk-song. The departing guests come down laughing and jesting. It has all the effect of the entry of an operatic chorus on a carefully selected stage. A dog barks somewhere in the security of the shadows beyond the pale-blossomed acacia-trees. The men move slowly away, singing softly in parts as they go, one of their number lightly touching the strings of his *balalaika*.

The moon is floating down behind the shining,

balloon-shaped cupolas of a vast white church, and the clear notes of a silver-toned bell ring out on the still night-air. Dim figures are moving up the steps through the great church doors. Within, the jewel-like lamps burn softly before the glittering icons, and dozens of little native tapers flame beside the pictures of the saints. There is no other light in the cavernous building, and the little candles show the quiet, shining faces of a crowd of peasant pilgrims waiting in the gloom for the rising sun to send them on their way. The minute points of light in the great building shine like fallen stars, giving a vast mysteriousness to shadowy aisles and night-wrapped, vaulted domes. The pilgrims

are on their way to the holy places of the Laura at Kiev—a great crowd of peasants, men and women, all alike in thick top-boots and shaggy, well-worn sheepskin coats, standing, with rapt faces, praying, the while a vested priest, with long curling hair falling over his shoulders, sings the office in a bell-toned voice before the Golden Gates of the mysterious Iconostas.

A little clock strikes three, and through a window of the church a faint gray light is seen dawning in the east. The moon has waned; the night dies down before the paling stars. Still the pilgrims stand before the icons, rapt in prayer. A new rose dawn steals up from out the east to kiss the west.

## CAPTAIN CARLOTTA.

By W. VICTOR COOK.

‘THIS is a bad finish to a good voyage, Señor Bruce.’

The sun-tanned, long-legged, old Catalan mariner, whom his countrymen quaintly called ‘the Little Bird,’ crooked his elbow round the tiller of the open boat, while with his nervy hands he sheltered a sulphur-match from the wind and lit a cigarette.

By great good luck not a man of the crew had been lost when the poor old schooner *Marta*, of Málaga, had been hit by the coward torpedo. Every one of the Andalusian crew was either in this boat or in the other, which, at about a mile distance, was also making for the Spanish coast. Still, it was hard luck losing the ship within a league or two of home.

‘The brutes must have seen us put in at Gibraltar,’ said Donald Bruce. The young Scot was feeling very sick with the horrible shock of the explosion, just a quarter of an hour ago. ‘If they knew how we landed a whole pirate crew of prisoners on the Rock, we should get short shrift, Pajarillo *mio*.’

The Catalan blew out a mouthful of smoke, and smiled. There was a look of rugged philosophy about his deep-lined face. ‘The trumps go round the table, Señor Bruce. We have none to-day.’

They had none, indeed. A hundred yards away from them a periscope poked up suddenly from the water, and the ugly shape of a submarine emerged like an evil fish from the blue depths. With one accord the Andalusians ceased rowing.

The U-boat closed, and an officer and several men appeared on her gleaming wet deck. Speaking in Castilian, the officer called out, ‘Who is the captain of that schooner?’

‘I am,’ answered the Scot, standing up in the stern-sheets.—‘Keep still, Pajarillo! They are going to take the captain prisoner.’

‘No, *por Dios*! It is I who am the captain!’

cried the Little Bird, drawing himself up proudly as he faced the German.

The latter smiled sardonically. ‘As there seems some doubt on the point, you will both come aboard here, and we will examine your claims at leisure.’

‘Señor Comandante,’ said Pajarillo with dignity, ‘you have sunk, in Spanish territorial waters, a Spanish ship, sailing under the flag of Spain.’

The Hun spat viciously into the sea. ‘That for your Spanish flag and your territorial waters! Come aboard, you dogs, before I hurry you with a machine-gun.’

There was no help for it, and the two men boarded the shark-ship.

‘Clear off, the rest of you!’ ordered the German; and the terrified boat’s crew lost no time in obeying. Then he turned fiercely on his prisoners. ‘Now tell me, quick, which of you is the captain of that wind-jammer.’

‘I am,’ said Bruce.

‘I am,’ said Pajarillo.

In point of fact, neither was; but the *Marta* and her mission had been their affair, and the old man whom they had paid to take her out to Teneriffe and back was in the other boat, half-way now to the Spanish shore.

‘Curse you!’ exclaimed the Hun. He looked keenly at the two men, and his cruel eyes rested on the younger. ‘You have the look of an English swine-dog,’ said he. ‘Are you one?’

‘I am a Scotsman,’ was the reply.

‘So much the worse. You have just come from Gibraltar. You need not deny it, for we have followed you. Tell me now the truth, and I will spare your wretched lives. Tell me lies, and I leave you to the fishes. How long were you in Gibraltar?’

‘Two days,’ said Bruce.

‘What regiments are quartered there?’

‘I am a Scotsman.’

'That is your answer!'

'You asked for the truth. You have it.'

'Ha! You are insolent? We will see how far an Aberdeen terrier can swim.' The Hun burst into a guffaw at his own humour, and turned to the Little Bird. 'What regiments are in Gibraltar, old rascal?'

The Catalan took his cigarette from his lips, and bowed. 'I am the Scotsman's friend, Señor Comandante.'

The Hun stamped on the steel deck. 'Understand, fool, if you do not answer, you die. Answer truthfully, and you shall live—on the word of a Prussian officer.'

'Señor Comandante, I find the security insufficient.'

'Pajarillo *mío*,' said Bruce in the Catalan dialect, 'you are a loyal man, but you are not British. Save yourself if you will.'

'Señor,' the old man answered, 'I have served with you for British gold and for private vengeance. Let them drown me as they drowned my brother. It is better to die a man than to live a traitor.'

The two men clasped hands.

'The water is warm at this time of year,' said the German. 'We will see whether the Spanish smuggler or the Scotch terrier can swim the longer. I am going to submerge.' He shouted a harsh order to his men, and followed them below with a cruel smile. The water-tight door slid to behind them.

'Courage, Señor Bruce!' said the Catalan. 'Never say die till you are dead. Slip your arms into this.' He pulled out a contrivance of india-rubber, and began to slip it over his companion's arm as the U-boat settled lower.

'Never!' Bruce jerked himself free. 'Put it on yourself. Quick!'

The water was almost up to the deck.

'We shall tear it if we struggle. You are young; I am old. Put it on.'

'Never! In God's name, put it on!'

'*Vaya!* I will.'

The Spaniard slipped his arms swiftly into the places provided, and putting his lips to a valve, blew hard. The water swirled about their legs. It was up to their middle. It swept them off their feet. They were swimming for their lives in the eddy left by the vanished submarine.

But the Little Bird had blown just enough air into the safety-waistcoat before the deck left them unsupported. Both men were strong swimmers.

'Keep yourself going for a minute, señor,' said Pajarillo. 'The more air I can blow into this affair, the more it will help us.' He blew till his brown face was red, and he gasped for breath, resting on the water.

'That is better!' said he. 'If Gibraltar lost us our ship, it has perhaps saved us our lives. I saw this in a shop in the Ramp Santa Caterina.

We will wear it in turn, and perhaps we shall be picked up.'

All that brave men could do they did, changing their frail support from time to time as one or the other grew weary. But it was a desperate chance at the best, and they knew it. The sparkling waves mocked the agony of their struggle, waiting till exhaustion should give them an easy prey.

A couple of hours passed, and they were still afloat, their lungs toiling, their hearts breaking with the strain. Bruce, who was wearing the waistcoat now, realised that the end was at hand.

'Take it,' he gasped. 'God save you! I am done.'

'Fight!' came the panting reply. 'A ship! Fight!'

But the younger man struggled no more. The blue waves rolled over him. For him the fight was over.

Had he died? Was this the awakening from death? He suffered exquisite pain. He was conscious dimly of a face—a most lovely face—which looked into his own. Slowly, between swooning and waking, he took in details of the watching face—black eyes shadowed with black lashes, black eyebrows beautifully arched, a pure ivory skin, masses of glossy black hair, red lips half-parted in a smile of triumph, and little teeth so white, so smooth, so sharp!

The face turned from him, and he heard words in a strange tongue. Something was put to his lips, and life coursed through his veins. The face bent over him again, and the voice he had heard spoke to him. 'Do you speak English?'

His own voice would not come, but he tried to move his head.

'I have saved you, my handsome Englishman,' said the face—'you and your companion.'

Afterwards Bruce slept for a long time. When he awoke, Pajarillo was sitting beside his bunk. There was an odour of cigarette-smoke in the little white cabin.

'Good-evening, Señor Bruce,' said the Little Bird. 'As you see, we are saved.'

'Where are we?' asked the Scot. 'I dreamed, Pajarillo. There was a face—a dark, beautiful face.'

'Oh, *là-là!*' The Catalan smiled. 'Young men always dream of beautiful faces. But indeed your dream was true. And it is Captain Carlotta herself who has saved us.'

'Captain Carlotta?'

'You never heard of her?'

'Never.'

'But she is famous, my friend, in the Mediterranean. She is a Sicilian, a heroine of romance. She served her apprenticeship at sea—dressed as a boy, they say, much of the time. And one day she passed her examination under the Italian authorities, and was given the com-

mand of a ship. They say there are few better sailors than she in Italy.'

Donald Bruce sat up. The Little Bird helped him out of the bunk, where he had lain rolled in blankets, and gave him his clothes, already dried. Bruce took some food that was placed beside the bunk, and accompanied the Little Bird on deck. The ship, a steamer of some three thousand tons, was running eastwards into the eye of a golden sunrise.

An officer came out of the chart-house just below the bridge. An officer—yes; but the officer was a woman. Her face was the same which Bruce had seen in his moment of returning life. The black masses of her hair escaped a little round the white cap with gold braid which she wore. Gold braid and gold buttons adorned her white uniform, in which a short skirt took the place of trousers, and her feet were encased in neat brown boots, surmounted by tight-laced gaiters.

She smiled as she came forward, showing the little, white, sharp teeth. 'You are better now?' The English words were spoken with just a pleasant accent of strangeness.

Bruce took the small, shapely brown hand that was extended, and on the moment's impulse kissed it. A man's emotions are a little out of hand when he has just been rescued from almost certain death.

'Captain Carlotta, we thank you from the bottom of our hearts!' Feeble enough words, he felt.

'Rather thank the good God who gave you strong arms to swim, and strong hearts not to despair,' answered the girl—she was little more. 'Your big friend here, whose speech we cannot understand much, was at his last gasp, but he was keeping your head out of the water. He is a proper man!'

'He is indeed a loyal comrade, signorina. May I ask whither we are bound?'

'To Naples, the city of light and love, Signor Inglese, unless we are unfortunate with the submarine which has been following us these twelve hours past—the same, I fancy, which sunk your ship.'

'Following you?' Bruce stared at the composure with which she made the remark, as if to be followed by a deadly shark-ship were the most ordinary thing.

The white teeth showed again. 'We have fired at them twice. They do not understand us very well, but they are very determined. Well, we shall see! Signore, a man like you should be in a fine uniform. Why are you not?'

The Scot flushed furiously. 'Signorina, you have saved our lives, and you have the right to ask. I am, or, rather, I was before the war, in the service of M'Iroy, M'Iroy, & M'Allister, a firm of some repute in Spain and London. I had some special knowledge of the Spanish

seaports, and my employers considered I could best serve the cause for which we all fight by remaining for the present in their employ, though in a different capacity. Thanks to their liberality, my friend here, who has his own reasons for hating the Huns, has been associated with me for the past six months in a little amateur campaign against the U-boats. Signorina, up to the present fortune has stood by us, and we have been the means of bringing to destruction four of these ships, and of causing grave inconvenience and annoyance to several others. I assure you we have done our best.'

A ripple of laughter came from the red lips. The black eyes flashed, and the small brown hand shot out. 'I greet a good comrade! The good God must have meant to bring us together. The same words with which you have described your labours, *caro signore mio*, would precisely describe my own during the same period. Come here, both of you!'

She led the way into the chart-room. Screwed on the table was a dial, very similar to that of a compass, save that this had a double ring of figures. The inner circle corresponded to the ordinary points of the compass. The outer was marked in kilometres and fractions of kilometres. The dial had two pointers. At the moment the shorter pointed to W.N.W., and the longer indicated six kilometres. The hands moved slowly as they watched, swinging slightly forward and backward from the points named. Captain Carlotta lit a cigarette, and smiled at the young Scot.

'When this little instrument has sunk ten U-boats I have promised to marry my lover, who has invented it. He has set it to run for twenty thousand kilometres, but he keeps the secret of its power locked in his brain. On the day he marries me, he will offer the secret to the Italian Government, and the Kaiser will have to think of a new frightfulness.'

Bruce translated this to Pajarillo, and the two men gazed with an intense interest at the little dial, from which a wire ran down under the table through the chart-room floor. Bruce looked up at the beautiful dark face of the girl-captain.

'Pardon, signorina; why not offer it to your Government at once?'

'I will tell you. My lover is an Anarchist. A foolish fellow—yes, but clever as the devil. If he were not my lover, nothing would make him offer his invention to any Government in the world. He does not believe in government. But he submits to mine!' The red lips laughed again. 'Pietro was a bank clerk. He invented this to amuse himself, but he refused to do anything with it. Then I said, if he did not fight for Italy himself, and give me his machine to try against our enemies, I would never speak to him again. He raved, and stormed, and pleaded; he threw himself on his knees. But

he was very much in love, so I had him in my hands.' She opened and shut her little brown hands dramatically. 'And now he is doing penance for his anarchism on the mine-sweeper *Elenetta*, while I am experimenting with his invention. I assure you it is very bad for the Boches.'

Bruce started. 'Did you say the *Elenetta*?'

'But certainly.'

'Do you love this Pietro, signorina?'

The black eyes gave him a strange glance. 'One serves one's country, Signor Inglese.'

Bruce spoke to the Little Bird in Spanish. The old Catalan, with a puzzled frown, stood contemplating the young Sicilian woman.

'Tell her,' he said curtly.

'On our way to Málaga, signorina, we were conveyed into Gibraltar by a British cruiser. While we lay there, the news came in that an Italian mine-sweeper, the *Elenetta*, had been sunk in the Strait by a U-boat, and that all hands were lost. One man, who died after rescue, said the German crew leaned over for some minutes, and laughed as they saw the men drown.'

Bruce watched the dark, lovely face as he dealt this blow. It did not change colour, but a new gleam came into the black eyes.

'Pietro was a poor kind of man,' she said deliberately. 'But it was I who made him go to sea. And it is I who will avenge him. Oh, *San' Iddio*, I will avenge him well!'

She glanced at the dial, took up a speaking-tube which lay beside it, and gave an order to the wheel-house above. The ship immediately began to swing round in a wide arc. She picked up her own wake, and went back along it at full speed. Captain Carlotta sat down at the table, watching the dial, and from time to time taking the cigarette from her lips to give an order through the tube. Presently she threw away the cigarette, and spoke through a telephone. 'That is for the gunners. There will be fighting soon,' she calmly announced. Now into the speaking-tube, now into the telephone, she spoke with curt, terse phrases as the hands swung on the dial, and the steamer swung this way or that to her order.

With a suddenness which made the two rescued men start, a gun roared from the vessel's deck, shaking her from stem to stern. Captain Carlotta looked up with a gleam of white teeth.

'Missed!' said she, pointing to the dial. 'But we frightened him. He is running away.' The dial fingers were in steady movement. 'But he is only two kilometres away, and if he dives, we are the faster ship. Yes, he has dived! *Ebbene*, we shall be nearer when he comes up.'

'Santiago! it is good hunting, Señor Bruce!' muttered Pajarillo. 'What is it she says?'

Bruce, in a low tone, informed him. The Catalan clicked his tongue. '*Maria purísima!* what a woman!'

'Seven hundred metres,' said Captain Carlotta without looking from the dial. 'The German is uneasy. He goes very slowly now. Oh, you were clever, my poor Pietro! Presently the Boche will come up to look for us, and, if God is good, we will ram him.'

A slight frown of deep attention puckered the smooth forehead as she pored over the terrible dial. The black eyes burned beneath their long lashes, but the slim brown fingers which held the telephone and the tube showed not the faintest tremor. For a tense ten minutes they waited thus, the ship's engines slowly throbbing, and the dial pointers almost stationary.

Then a terrific report like a thunder-clap crashed in their ears, followed instantly by another shattering roar from the steamer's gun. There was a confusion of noises on deck, and the shock of heavy falls. But Captain Carlotta never lifted her black eyes from the dial. She shouted an order through the tube, and the throbbing engines accelerated swiftly.

'Hold tight!' cried the girl, and grasped the arms of her fixed chair.

Too late the caution. There was a rending beneath their feet, and Bruce and the Catalan were flung to the floor.

The girl-captain sprang up and ran out, and they picked themselves up and followed.

The deck was littered with smashed gear, and spattered with blood. Half-a-dozen stricken men lay scattered about, and a boat hung loose from one davit. The Huns must have been wonderfully quick in emerging and bringing their gun into action; but they had paid dear for the damage. Just astern the steamer a strange body, like a monstrous buoy, was swaying in the waves. It was the U-boat, completely up-ended, and on the portion thus sticking out of the water a number of men were clinging. Others were swimming in the sea. Even as Captain Carlotta rang to stop the steamer's engines, the remaining portion of the submarine slowly sank from view, and presently there were only swimming survivors, little black dots upon a sea all filmed with oil and alive with sickly bubbles.

'Rammed, *por Dios!*' the old Catalan shouted with exultation. The Scot nodded, awaiting developments.

A boat was lowered, and on the captain's order a coil of stout cord was placed in her. Every rescued man, as he was taken from the sea, was at once bound fast with his arms to his sides, and thus bound they were brought aboard the steamer and ranged in line, a soaked and sullen crowd of a dozen men, including the Hun commander.

The Little Bird laid on Bruce's shoulder a hand which shook with excitement. 'Look you, señor—the very same villain who sailed away from under our feet and left us to struggle to our death!'

"To every pig his Martinmas," said Bruce, grimly quoting the Spanish proverb.

Captain Carlotta stepped forward and addressed the prisoners in English, the *lingua Franca* of the sea. The beautiful dark face was ominously calm.

'Pirates and murderers, how many ships have you sunk?'

The Hun commander stared at the girlish figure. 'Who asks?' he demanded insolently.

'How many ships?' repeated the girl-captain, setting her lips under his stare.

'A ship for every year that you have lived, pretty captain.'

'And merchant ships, and passenger ships, how many?'

'Enough to win this, *bella signorina mia*.' With an odious leer, the German pointed to the Iron Cross pinned to the breast of his wet uniform.

'And the *Elenetta*?'

'That was two days ago. But how did you know? There were no survivors.'

'And of all those ships, how many prisoners did you take?'

'Prisoners? My ship, pretty captain, is not a prison, nor a lifeboat.'

'Nor is mine,' answered Carlotta. She gave an order in her own tongue, and half-a-dozen sailors swarmed into the steel shrouds of the steamer. In a few minutes, on either side of the ship's foremast, a festoon of nooses swung, each cord hitched a couple of feet higher than the one below it.

A look of ghastly fear came into the faces of the sea-murderers. The commander of the U-boat sought to brazen it out.

'Signorina, I have always understood that the seamen of Italy are chivalrous to a beaten foe.' He bowed.

'I am not an Italian,' she replied coldly. 'I am a Sicilian. And I am not a seaman, but a sea-woman. And you have killed the man who was my lover.'

'What I have done has been done by order. It is war. I am not to blame.'

'And what my men here will do will be done by order—my order. They are not to blame.'

'Signorina, what will you do?'

'I will execute a batch of murderers.'

'*Gott im Himmel!*' The Hun stepped forward. 'It is monstrous! It is contrary to the usages of war.'

'We are not talking of war; we are talking of murder,' said Captain Carlotta. She gave an order in a level voice. The first of the Germans was seized, led struggling to a noose, and next minute was kicking in mid-air.

The German commander, fast held by two Italians, was beside himself with terror and dismay.

'In the name of civilisation, I protest!' he cried. 'I am a Prussian officer.'

'Since you are a Prussian officer,' answered the girl, 'you shall have the privilege of your rank. You shall hang last and highest.'

'It is murder!' screamed the wretched man.

In pairs the Germans were led forward on either side of the mast, and swung into the air. Bruce, sickening at the sight, stepped forward. 'Captain Carlotta'—he began.

She faced him with flaming eyes, and pointed imperiously. 'Go below, Englishman! The English are too sentimental. This is vendetta. Go below!'

'But hear me!'

'Afterwards. Go below!' She stamped her small foot, and ere he could say more he was seized by two Italians and taken below. Pajarillo remained on deck, watching the grim spectacle with an impenetrable face.

It was evening when Bruce was permitted to return on deck. The foremast shrouds were festooned with a ghastly line of corpses. The Little Bird, sitting on the bottom step of the bridge ladder, was watching them dangle in the air as he gravely smoked a cigarette.

'Pajarillo, where is the captain?' asked the Scot.

'At dinner,' answered the Catalan. 'She invites us to join her; but I do not feel very hungry, Señor Bruce.'

'Nor do I,' said Bruce. 'What a woman, Little Bird!'

'She is going to sail into Naples like this,' said Pajarillo, nodding at the swinging bodies. 'It will give the Neapolitans something to talk about. And to think, after all, that she did not love this Pietro! *Hombre!* to my thinking it is yourself who is more to her fancy, Señor Bruce.'

'God forbid!' said the Scot fervently.

'Why so, señor? If I were of your age—*hombre!*' The old adventurer flicked the ash from his cigarette, and nodded again towards the swaying corpses. 'That is justice—good justice,' he continued. 'She and I are of the South, and I understand. But you are of the North. The North is too cold to understand.'

'Too sentimental,' she said.'

The Catalan nodded. 'You have no volcanoes in England. There is a great deal in geography, Señor Bruce.'

#### THE SORROW OF THE SEA.

'There is sorrow on the Sea: it cannot be quiet.'

THERE is a sorrow on the moaning Sea,  
The burden of unutterable woe!  
Throughout the ceaseless moving to and fro,  
As from its memories it seeks to flee,  
Can you not hear it sob eternally?  
Such mysteries bide in its depths below  
That never in its endless ebb and flow  
Shall it find rest, nor ever quiet be,  
Until the Day when it its dead must yield,  
All hearts be known and secrets be revealed.

### STROMBOLI AND THE NETHER-WORLD.

#### A CHAPTER OF EXPERIENCES.

By Commander LORD TEIGNMOUTH, R.N.

*Teacher.* 'Suppose you were to dig straight down through the earth, what would you come to?'

*Scholar.* 'The devil and all his works.'

Dr MACNAMARA, *School Humour.*

THE appalling disaster in the Strait of Messina some years ago, by which the beautiful and interesting city from which the channel takes its name was laid in the dust, focussed attention once more on a region which has been associated from time immemorial not only with violent physical disturbances, but with certain uncanny phenomena which defy explanation.

That both Etna and Stromboli afford a vent for the fiery furnaces imprisoned beneath the earth's crust is from time to time impressed on the neighbouring inhabitants by fierce and destructive eruptions. But that either of these volcanoes should also provide channels of communication with the nether-world is a contingency which seems to have escaped the attention of those lynx-eyed probers of mysteries called scientists. Albeit, the possible existence of some such 'right-of-way' was seriously entertained in former ages, as is plainly indicated by certain weird happenings which research has brought to light, and which—though ignored by the erudite compilers of our gazetteers and travel hand-books, ay, and even by the authors of those immaculate works, the 'Admiralty Sailing Directions'—well merit the attention of lovers of the occult.

Whether or not the existence of a short cut to Hades was known to the eminent Greek philosopher Empedocles when he cast himself down the crater of Etna, in order that his disappearance might cause posterity to invest him with the attributes of a god, cannot be affirmed at this distance of time with any certainty. It is possible, of course, that he mistook the crater in the dark for the straight and narrow path which leads to quite another place. One opines, however, that some such thought was in Robert Southey's mind when, in the year 1801, he declared his intention—on the principle of 'giving Satan his dues'—of 'taking his only law-book to the top of Mount Etna for the express purpose of throwing it straight down to the devil.' But one must not dogmatise too freely on the mysteries of creation. It is well known that his Satanic Majesty is ever on the look-out to trip one up.

The first authentic statement on the subject

comes to us from the time of our King James I. (1603–1625), during whose reign a certain Sir John Gresham—brother of the famous Sir Thomas Gresham, builder of the Royal Exchange (the second one preceding the present building)—went a voyage up the Strait. Landing with eight of his men on Stromboli, he climbed to the top of the burning mountain, and while there—so runs the story—he heard a voice issuing from the crater, saying, 'Despatch! Despatch! for rich Antonia is coming!' Proceeding to the island of Sicily, Sir John there heard that a Mr Antonia, counted the richest man in that part of the world, had died at the very time they were upon the burning mountain, and heard those words come out from the fire of the crater. When Sir John arrived in London, he, with his eight men, made oath before King James to the truth of the same.

King James's comment on the travellers' tale is not recorded.

No further record of occult manifestations on the burning mountain reward the searcher until some seventy years later, when one of the most thrilling experiences that ever befell a party of sailors overtook some merchant captains on this same spot, giving occasion, later on, for quite the most remarkable lawsuit that history has ever recorded—to wit, an action-at-law for the defamation of a dead man's soul!

The story, as related by eye-witnesses of the occurrence, is as follows:

'AN AWFUL ABSTRACT FROM THE JOURNAL OF THE SHIP "SPHINX" IN THE YEAR 1685 UP THE STRAITS.

'May 12.—When we arrived at Manson we found three ships lying there from London—all going to Lipari to load. These ships sailed in company with the *Sphinx* to Lipari.

'May 14.—The four captains and a Mr Bell, a merchant, went ashore upon the island of Mount Stromboli to shoot rabbits. About three o'clock, when they called their men together to go on board their respective ships, to their inexpressible astonishment they saw the appearance of two men coming very swiftly through the air towards them; one of them appeared to be dressed in black, and the other in gray clothes.

They passed by with the greatest rapidity, and, to their extreme consternation, descended amidst the burning flames into the mouth of that dreadful volcano, Mount Stromboli. At their entrance there issued tremendous noises; the flames rushed out most terribly, and Captain Burnaby cried out, "The Lord bless me! the foremost man of the two, in black clothes, is Mr Bootty, my next-door neighbour at Wapping; but I do not know the other." He then desired them all to write down in their pocket-books, or note it on something, what they had then seen, which was immediately done by the three captains and Mr Bell, and likewise entered in the different ships' journals at the same time.

'When they arrived in the river Thames at Gravesend, Captain Burnaby's wife came from London to him. He then sent for the other three captains to come on board his ship to congratulate him on his wife's arrival. After they had thus met, a little conversation passed between them in the cabin, when Mrs Burnaby suddenly started from her chair, and said to her husband, "My dear! I'll tell you some news. Old Mr Bootty is dead!" He directly answered, "We all saw him go into hell!" &c., as before related, to her serious alarm.

'When Mrs Burnaby had returned to London, she went to an acquaintance and related this serious event, that her husband had seen the soul of Mr Bootty go into hell on the 14th of May last. This gentlewoman then mentioned the same to Mrs Bootty, widow of the deceased, who immediately took out a writ of the King's Bench Court, in the penal sum of one thousand pounds damages, and arrested Captain Burnaby for defamation upon her husband's soul. Captain Burnaby gave bond to stand trial; and he then took out of the Court in the King's Bench in Westminster Hall summonses for all the people who had attended the late Mr Bootty in his last sickness, and at the time of his death; also the sexton of the parish who had buried him; and the clothes he had last worn before his sickness, he had taken care of, to be introduced in court on the day of the trial.

'When the trial came on, the different persons, with the black clothes, were brought into court, and were there met by Captain Burnaby, the captains of the other three ships, and the men of the four boats, with Mr Bell, who were all on the said island of Stromboli, and saw the two apparitions descend into the burning flames on the aforesaid 14th of May last. Two of the men of the boats made oath that the buttons on the coat which the apparition had on were like the present, being moulds covered with black cloth, the same sort that the coat was made of. The different persons that were with Mr Bootty at the time of his decease made oath that his death happened at three o'clock on the 14th day of May last, which was in the year 1689. The jury then asked the captain of the *Sphinx* if he

knew Mr Bootty in his lifetime; he answered that he never saw him in his lifetime, but plainly observed the dress the apparition had on, which Mr Burnaby said was Mr Bootty, in company with another unknown.

'The judge then spake: "The Lord grant that I may never see such a sight as that, for I think it impossible for thirty men to be mistaken. The jury then gave their verdict against the widow Bootty; plaintiff to pay the costs of the court, &c.'

It is further on record that, as late as the year 1807, the account of this remarkable trial was to be seen in Westminster Hall on the records of the King's Bench, the said records being written on parchment, in Latin, and kept in a glass case in the clerk's office, where, for the sum of one shilling, they might be inspected by all and sundry.

If this story does not excite a longing on the part of students of the occult to run straight away to Stromboli, there to await further revelations, they must possess much less enthusiasm than they are usually credited with.

Personally, I have every reason to remember Stromboli, owing to an event associated with a very early stage of my naval career. I was serving at the time in H.M.S. *Gibraltar*, eighty-one guns, one of those stately wooden line-of-battle ships which, back in the early sixties of last century, represented the might and majesty of Britain in foreign waters. Passing Stromboli one fine afternoon under canvas, the vessel was struck by one of those sudden squalls which are characteristic of the Mediterranean, and, before sail could be shortened, she was forced over almost on to her beam-ends, and sad havoc wrought aloft. It was all over in a few minutes, leaving the ship a shockingly dishevelled object—a mass of torn canvas and broken spars, the clearing away and replacement of which occupied 'all hands' for a very long time after. But what particularly impressed the event on my mind was that, as it was Saturday, and an 'afternoon off,' most of the midshipmen, myself included, having neither watch nor drills to keep us busy, were 'taking a stretch off the land'—in other words, sleeping on top of our sea-chests—and when the ship heeled over to the squall we were rolled off, and our pleasant dreams rudely disturbed by contact with the hard deck. While, somewhat dazed, we tried to collect our scattered wits, the shrill call of the boatswain-mates' whistles resounded through the ship, followed by the hoarse roar of 'Clear lower-deck!' which brought 'all hands' up with a rush to remove wreckage and make temporary repairs sufficient to enable the vessel to reach port under sail.

Our captain, an officer of repute, who had grown gray in the service of queen and country, and who took a real interest in the welfare and professional efficiency of the 'young gentlemen'

entrusted to his care, very wisely availed himself of the object-lesson in seamanship which the mishap afforded, more especially in the resourcefulness displayed in extemporising means of repair, by ordering us all to write an account of the affair, and make plans and drawings of the various expedients that had been adopted in the way of 'fishing' spars, &c., to enable the sails to be reset. In the sequel, the essay submitted by the present writer enjoyed the distinction of being placed first in order of merit, and is still preserved as an interesting record of a state of things which has passed away, never to return.

Even when the mishap occurred, the 'tin-pots'—as the early ironclads were somewhat contemptuously called by the sailor-men of those days—were elbowing the old wooden two-deckers and graceful frigates, relics of Nelson's day, into a back place. *Sic transit gloria mundi!*

Poets would have us believe that winds are not infrequently 'charged with messages from the past.' It may be so. But, although the squall on the occasion above described came straight from Stromboli, no intelligible message was conveyed, all other sounds being drowned in the flapping of canvas and crashing of broken spars.

## THE FORESTER'S GIRL

### CHAPTER VI.

THE sun, grown uncomfortably warm, had already shifted in its course, leaving Anita in the grateful shadow of the mighty column against which she leaned, when her pen, granted the right conditions, as facile as her tongue, paused in its rapid tracing of her fine, pointed writing. She had told David everything—about the folks in the small valley town where she taught school; about the long, dusty journey and her travelling-companions; about her morning on Bear Creek with the taciturn Englishman; of the lilies he gave her and the squirrel he was to skin for her. It made a long letter, but if David could not get down for another day or two it would cheer him up to read all her news; and even if he should arrive soon—well, Anita reflected, a slight blush creeping up into her cheeks and her expressive dark eyes growing shy, maybe David wouldn't want to talk much. A low, sweet laugh rippled forth at thought of David; he was so merry, such a demonstrative lover, and so jealous. She liked that kind. Now the Englishman—She pulled herself up. What connection had he with thoughts of her sweetheart? Of course, she would tell Dave all about it when they were together; no use writing all *that*. Nor did it, in any case, matter very much, for evidently the remembrance of her had completely faded from his mind. Yet but for him—and the sudden conception filled her with a strange sense of joy and satisfaction—but for *him* she would not be here at all, would never have seen these wonderful woods and the glorious cañon, never—why, of course, she would never even have met David Hardy!

Entirely preoccupied with this new thought, Anita let fall her pen unheeded among the pine-needles, the sheets of her letter fluttered from her hand, and she sat quite still, her mind suddenly recalled to the far-distant scenes which had constantly recurred and haunted her ever since, in Charlie Axel's creaking wagon, she had caught sight of Gavin Barrie's grave gray eyes and

handsome features. How was it that he, too, did not remember? The eternal feminine within her began to feel piqued, and, vexed with herself that some subtle instinct held her back from frankly reminding him—Anita gave a startled scream as something cold was suddenly thrust in the back of her neck, and turning in quick alarm, she discovered the red-brown dog thrusting a wet nose at her and wagging his tail in delighted recognition.

'Oh "Bob"! ' she cried; 'how you frightened me!' Then, as his master, unmistakably pale, and leaning heavily on a stick, limped into view, she exclaimed, 'Mercy, Mr Barrie, what has happened? You look awfully white, and you're quite lame. Do come and sit down,' she added, turning upon him a face full of solicitude.

Now Gavin Barrie, having been foolish, was bound to pay the penalty for his folly. His injured foot, goaded, from a sheer sense of vindictive opposition on Barrie's part, into carrying him in and out of thick bush and up and down the steep sides of the cañon in the hot sun, was now so inflamed and painful that the young man, to his complete chagrin, suddenly found himself lying on the ground, feeling very sick and tired, and wholly unaware as to how he got there, his head resting in the lap of the girl Lalonne.

'*Pauvre p'tit! pauvre p'tit!*' she was murmuring tenderly, as with gentle touch she wiped his forehead with her soft handkerchief or smoothed back his hair.

Gavin's first thought, upon recovering his senses, was a very human one. So comfortable was he beneath those soothing fingers that he did not care to move, and his eyelids half-closed against the glaring light of the sun-whitened sky.

But instantly the male within him, which cried shame at any display of weakness, reasserted itself; he sat upright with a jerk, while a deep flush reddened his pale face. 'Must have been this confounded foot and the hot sun,' he stammered half-angrily. 'Sorry if I upset you.'

I'm all right now;' and reaching for his gun where it had fallen, he scrambled to his feet.

The mounting sun, however, in all its summer strength, had indeed caught the Englishman, fresh from a less ardent clime, a slight blow, and this, rather than the pain from his injury, had caused a faintness which again so came over him that he caught at the tree to prevent himself from falling a second time.

'Please sit down, Mr Barrie,' pleaded Anita, taking the gun from his hand and quietly assuming the reins of authority, as womankind ever does when her mate's inherent strength deserts him, their Maker having thus beautifully adjusted the balance when 'male and female created He them.'

Gavin meekly obeyed. Indeed, he had little choice if he were not again to disgrace himself by toppling over; so, inwardly cursing Kenneth Grey's horse, the Californian sun, and his own pig-headedness, he stretched himself in the shade of the pine, propping his head on his elbow. Anita, busying herself collecting the scattered pages of her letter, and searching for her pen, refrained from looking at the crippled Achilles; and presently he remarked in the shy, half-boyish way he had of expressing himself, which wholly belied his *Alma Mater*, 'Sorry I upset all your writing-things. Never made such an ass of myself before.'

'Oh, that's all right,' cheerfully replied Anita, and, relapsing into the crude Americanism that had so jarred upon Gavin Barrie, added, 'I guess it was the hot sun. Something fierce, ain't it?'

'Yes, pretty hot,' rejoined Barrie, honestly struggling to be affable. 'But I suppose without it you couldn't grow water-melons.'

'Oh, that sounds just like Dave!' cried Anita, her momentary reserve vanishing at once, her piquant countenance, full of smiles, turned full upon him. 'Do you like 'em too?' she asked between jest and earnest.

Gavin, feeling that it was 'up to him' to sustain the conversation, answered with well-tempered enthusiasm, 'Oh yes, I like them. Don't you?'

'You bet! on a hot day like this. But Dave—why, Dave would eat water-melon until he was sick,' she went on, throwing back her head and laughing merrily. Then, with a slight shrug of her shoulders and a flutter of her tiny hands, 'As for me,' she said, her eyes growing pensive, as though visioning far other scenes—'as for me, give me an ice, a wafer, a cup of chocolate—yes?' she broke off questioningly, tipping her pretty, dark head a little on one side, clasping her hands, and looking full into Barrie's gray eyes with her great dark ones.

Something in the man's heart, deep buried, long repressed, suddenly burst into life again—something which already for the last day or two, under the subtle influence of this girl's personality,

had, like the first stirrings of an embryonic thing, begun to fill him with a mingled sense of pleasure and unrest. Ninety-nine men out of a hundred in Gavin Barrie's case would, during their return along Bear Creek the previous day, have tried to solve the riddle of this girl who, ear-marked with the most palpable of American crudities, had nevertheless, when startled out of her normal self, addressed him, apparently quite unconsciously, in that language the very timbre of which was the pass-key to the innermost temple of his heart. But the demon (or guardian angel?) of fastidiousness, which ever stood between him and the world of women in general, had held him silent; he could not, nor *would* not, take the first step which might lead to a bridging of the distance between himself and this young woman whom chance had thrown in his way. And so, although more than once had echoed in his ears the unwonted words which escaped from Anita's lips, '*Mais non, monsieur. Ayez pitié de moi!*' he made no attempt, either directly or indirectly, to follow up this clue to her history.

Now, however, a close observer might have noted in Gavin Barrie a swift and complete relaxing, as it were, of an artificial tension.

Stretching his long limbs more at ease, and toying with a cigarette, he said rapidly in French, while a sudden fire lit up the full, dark irises of his fine eyes, 'Tell me, mademoiselle, where did you last nibble an ice and sip chocolate?'

As a spark to tinder then leapt between these two the magic of the tongue so near and dear to them both, transforming their very features and expression, as thought kindling thought bore them together into a little kingdom of their own, far outside the farthest limits of their physical environment. From Anita Lalonne dropped, as it had been a cloak, every vestige of her identity as the crude western school-teacher in some insignificant valley town—bride-to-be of a Californian forester. Sparkling with animation, with flutter of hand and brow, every gesture a word, every inflection of her liquid voice a sentence, she sat there, among the giant redwoods of a Sierra Nevada forest, the very embodiment, to Gavin Barrie's eyes, of a gay little Parisienne; not your *grande dame*, but the pretty, piquant daughter of the people, the life and light of the light-hearted city of the Seine.

As for the Englishman, surely his own father, who ever found him so dull a companion in the after-dinner half-hour, who misinterpreted his reserve as sullenness, and his taciturnity as lack of wit, would never have recognised as son of his the animated youth who, with hands lightly clasped behind his head, laughed, joked, rallied, parried, questioned, and quizzed in a foreign tongue the beautiful girl who seemed fairly to scintillate like a diamond in the brilliant summer sunshine.

Anita, on her side, tacitly on guard not to reveal her identity, since monsieur was apparently

quite oblivious; Gavin, for his part, too courteous to indulge a curiosity now thoroughly aroused, the two contented themselves with the surface of subjects mutually interesting. What mattered it of *what* they spoke, so long as it turned on their beloved Paris? The very names of the streets were music to their ears, and at mention of this or that *place* or *pont*, *magasin* or *marché*, Anita would clasp her hands in an excess of enthusiasm, and launch forth upon a fresh torrent of question and comment.

Wholly forgotten was the pain in Gavin's foot; forgotten Anita's letter to her sweetheart, now crushed and moist in her warm hands; forgotten the very existence of Grizzly Station and its inmates, until suddenly the red-brown dog, who, always ready to adapt himself to circumstances, was noisily enjoying a sound morning nap, woke with a start and barked loudly just as the thick-set figure of Charlie Axel, heavy gun over his shoulder, the inevitable china pipe pendant from his teeth, appeared out of the thicket.

'Gute-mornin', Mees Lalonne.—Gute-mornin', Mister Barrie!' he called out heartily. 'I ain't seen you folks before to-day. Went out awful early to try an' find a *goat*;' and he laughed and winked at Barrie. 'Bin 'way over to Brady's Flat an' seen plenty tracks, but not a horn in sight. Mein Gott, but it's some warm!' he exclaimed, pulling out a large red handkerchief and mopping his streaming face. 'You bin huntin' too, Mister Barrie?' he asked, glancing at the neglected gun.

'Oh no; not I!' rejoined Gavin pleasantly. 'I merely poked about the cañon for a little time; have a foot out of commission! I managed to put it under the hoof of that big horse of yours,' he added casually, beginning to rise from his comfortable position on the ground.

'Too bat; too bat!' sympathised Charlie. 'But Dr Grey—he'll fix it up for you. Seen him since he got back? How's de leetle poy?'

'No,' replied Gavin, all at once aware that the morning must be far spent. 'We—I haven't been about the station.'

'Not bin to *dinner*?' interrupted Charlie, a comical expression of concern gathering on his good-natured face. 'Why, it's half-past twelve, an' mamma'll be *awful* mad!' he broke off, laughing again. 'You'd better hurry or dere'll be nuthin' left; dose men has eat everyt'ing, I guess, 'cept de melon-rinds!—You didn't see de folks *what was askin'* for you, Mees Lalonne?'

he questioned of the girl, as the trio made their way back towards the station as fast as Gavin's foot would permit, while 'Bob,' ears and nose having detected dinner in the air, rushed unceremoniously ahead of them.

'No,' replied Anita. 'What folks?' she asked eagerly. 'Dave?'

'Naw, naw, not Dave, Mees Lalonne,' answered Charlie, and added chaffingly, 'Guess you an' Mister Barrie can git along widout Dave, eh?' then went on: 'It was them fellers what went out yesterday mornin'—Nat Duncan an' de rest of de crew. I met 'em just as dey was hittin' out agen. Momma, she *was* mad, 'cose dey ate most all de dinner, an' she warn't 'spectin' 'em before to-night!' and Charlie chuckled over the poor old body's discomfiture.

'But my letter!' cried poor Anita. 'My letter to Dave! You said they would take it to him, Mr Axel!'

'Well, to be sure; but it warn't in de mail-pag, was it?' asked Charlie. Then, seeing the girl's eyes fill with tears and a look of real distress in her face, he added hastily, 'But *dot's* all right, Mees Lalonne. I tol' 'em to tell Dave dot you was here safe enough, so don't you worry 'bout *dot*.'

'But, Mr Axel, Dave would be expecting a letter. See, I have it all written! Maybe,' she said, looking hopefully at Charlie—'maybe some one else will be going past his home. Don't you think so?'

'Naw, naw, not for a day or two. Dis is de mountains, you know, Mees Lalonne.—Ain't it, Mister Barrie?' he said consolingly, and appealing to the Englishman. 'Dere ain't no reg'lar post; but Dave, he knows *dot* well enough by now. Them foresters has to go sometimes for weeks at a time widout any letters; just depends whedder anybody is goin' in so far. But Nat'll give Dave my message all right,' he again reassured her, before turning aside to the wash-house, where a tin basin and chunk of yellow soap were all the luxuries in the shape of a bathroom that the Grizzly afforded. Barrie followed suit; while Anita, with her heart troubled about her first failure to David Hardy, and rather dreading the reproving eye of Mrs Axel over her tardy appearance, tucked the unposted letter into her blouse, and making a hurried meal before the Englishman should arrive, betook herself to her own room, there to indulge in a 'good cry.'

(Continued on page 116.)

## AN OUTPOST IN THE MAKING.

IN the far-off days of the early summer of the year 1914—days as irrevocably lost to us now as those of the Ptolemies; days when the most important questions were, 'Will Ulster

really fight?' and 'What will the Russians [dancers, not fighters, then] do without Nijinsky?'—four short years ago, in fact, there appeared in the *Morning Post* the following news-item,

despatched from Winnipeg, and dated 11th June:

**'SEARCH FOR DEAD EXPLORERS.'**

'A Royal North-Western Mounted Police patrol leaves Regina about 20th June to search the far north land for the bodies of the explorers Radford and Street, who went north three years ago. It is reported that they were murdered by Eskimo. This is the most perilous task ever undertaken by the famous redcoats. The country is the bleakest in Canada. They will commence their investigations in Chesterfield Inlet, and patrol thousands of miles inland, also maintaining order at the Hudson Bay posts on the way. They will be commanded by Inspector Beyts. The number of men has not yet been announced.—REUTER.'

Reuter, we may suppose, was well informed; at any rate, there are no more inaccuracies in the above paragraph than are to be found in most news-items; and the newspaper man cannot be expected to know everything about everything. 'Most perilous task' and 'famous redcoats' bear the same relations to the average newspaper chronicle of the doings of the 'Mounties' as King Charles's head bears to Mr Dick's memorial. Further, the task was no search for dead bodies, but live ones; not murdered, but murderers. For the rest, the paragraph was as nearly true as it was bald.

The circumstances leading up to the organisation of this special patrol were, briefly, as follows.

In the summer of 1911, Radford, a Yankee, accompanied by Street, a Canadian, left Edmonton on a lengthy journey over that vast, undeveloped, unexplored region of Canada lying a few hundreds of miles to the north of those pleasant provinces which smile so amiably on the globe-trotter as he surveys them from the windows of his luxurious observation-car. Few people have even heard of the Barren Lands, as they are called; fewer still have given them a second thought, though they are big enough, and empty enough, and mysterious enough, in all conscience. The object of this long journey over an inhospitable region was—what? The advancement of science—biology, geology, geography, natural history? Partly. Amusement? Yes, to a certain extent. But more than anything, I think, that nameless something in certain spirits, a something in which curiosity has a large part, which compels them to acts which stay-at-homes stigmatised as fool-hardy.

In order to make clear the itinerary of these men, it becomes necessary to visualise, roughly, the map of the Dominion. This, it will be remembered, is somewhat of the shape of a rather shallow bucket. Right down the left-hand side of the bucket runs the mountain-chain known as the Rockies; parallel with this immense ridge, and a little nearer to the centre

of the bucket, is the lengthy Mackenzie River, ever flowing northwards. The lip of the bucket is well inside the Arctic circle. The handle of the bucket is a great frozen peninsula, and the Hudson Bay, being water, must be represented by a large chunk bitten out of the upper right-hand corner. Edmonton, the city from which the couple set out, lies not far from the lower left-hand corner. The intention of the explorers was to make a vast triangle over the Barren Lands, the southern angle of the triangle lying at Edmonton. The north-west corner of the Hudson Bay was at the eastern angle; and Herschell Island, close to the mouth of the Mackenzie River, formed the apex of the triangle.

But the apex never was reached; for, when they were half-way along the second side of the triangle, that joining the northern part of Hudson Bay to Herschell Island (at Bathurst Inlet, which lies a little to the left of the handle of the bucket), a fatal quarrel arose with some local natives, but newly engaged as guides by the white men. Arms were whipped off the sledges; but snow-knives, already in the hands of the terrified natives, came faster into play, and—the white men were dead men, tumbled over a steep cliff into the sea.

The native who had brought the unfortunate men as far as this fatal point was a Kenipitu, and hailed from the vicinity of the Hudson Bay. He was already returning to his far-distant *igloo*, but, being overtaken by a party from the tribe of the murderers, was told of what had taken place, and sworn to secrecy—an oath as easily extracted as broken.

If he hurried homewards, as a personal acquaintance with the man would very strongly indicate, his haste was bootless, for, as he moved southwards, he came to large rivers loosening under the influence of the climbing sun. These, without a canoe, he was unable to cross. Consequently it was not till some five months later, when the short summer had passed and the rivers were again solid, the snow on the ground, and all life had fled the country, that he was able to make for home once more. In the latter part of the same winter—that is, early in 1913—this Eskimo reached the Hudson Bay. It is, I think, a strong instance of the broad feeling of humanity that does truly lie deep down in the Eskimo character that he reported the whole affair straightway to the factor of the Hudson Bay Company at Chesterfield Inlet, who, of course, communicated the matter to the isolated police post at Fullerton, and also to the police headquarters of the district at Churchill. Naturally, such information was forwarded as quickly as possible; but it was August 1913 before the police in civilisation heard about it. The news had taken one year and five months to get to the right quarters; and bad news travels fast, they say. This is a point to be noted. Travel in the sub-Arctic is, in one

respect, more difficult, and in some instances more hazardous, than in higher latitudes; for the country is only snow-bound for nine months of the year. As a consequence, two utterly different methods of travel have to be adopted—namely, sledges hauled by dog-power, and canoes driven by man-power. Further, each side of the summer, when the snow is melting in spring, and when the snow is falling in the autumn, no form of travel is possible, since the snow is too soft for the sledge, and the ice is either breaking up or forming, as the case may be.

The news, then, got to Ottawa at the close of 1913, where, one supposes, it was deliberated over and commented on, the result being crystallised in the Reuter's despatch from Winnipeg.

So much for the causes of the patrol. But the intelligent reader will at once go deeper, and inquire as to the causes of the disastrous quarrel which led to the swift destruction of the two white men.

There is not the least doubt that Radford was a hasty man. He was also an American; and the Americans have yet to show an instinct for handling native peoples—if, indeed, they have not already shown the reverse. But any one having any acquaintance with the Eskimo character will at once insist that there must be even more yet behind such a murderous assault than the hasty actions of a white man. And there is more. But before we can arrive at what that is, we have to turn back several pages of history.

In the year 1771, Sam Hearne, a man in the service of the Hudson Bay Company at Fort Churchill, penetrated, or, rather, drifted, along with a band of Indians, to a spot close to the mouth of a river known as the Coppermine, from the rich deposits of native copper found on its banks, and at no great distance from the place where Messrs Radford and Street later met their deaths. Here Hearne and his Indians fell in with a small tribe of Eskimo, forefathers of our quarry, and here the Indians fell upon them, and spared none—none, save a few women and children who witnessed the massacre from the other side of the Coppermine River. Hearne, if he ever had any control over his Indians, lost it when they sighted their hereditary prey, the timid Eskimo. He named the spot Bloody Falls.

Hearne is dust, and the Indians have long since sought the 'happy hunting-grounds;' but

to this little tribe of Eskimo the white man and danger are synonymous to this very day. I believe that it is true to say that no single white man has gone into this particular stretch of country and come out alive. It is, of course, difficult to say this with certainty, as the possible lines of approach to the country are many, and there are a vast number of unknown fur-trappers, prospectors and the like, ever pushing forward into the wilderness.

On a native people having such a tradition behind them, the effect of a white man becoming heated, perhaps losing his temper—nay, even breaking into a fury, can be followed with only one result. It is kill, or be killed, they think.

There is a name very well known to the student of the Central Eskimo, and also to a small section of seafarers whose business lies in the higher latitudes. It is also as well known, and much beloved, by every Aivillik, Kenepitu, Igloodik, Shaunikumuit, and Padlimuit, the five tribes of Eskimo inhabiting the region about the north-west coast of Hudson Bay. This is Captain George Comer, who has been whaling in that part for the past twenty years or more. He, whose knowledge of the Eskimo character is beyond cavil, was one of the first to assure Government that the fault of the tragedy could not lie entirely with the native. So it became the duty of the Mounted Police to find out whose fault it was, and to 'take action'—a comprehensive phrase, almost equivalent to the 'as requisite' of the British Navy.

The reader may ask what on earth the Mounted Police are doing in this galley. What have mounted policemen to do with driving-dogs and Arctic travel? The native of Canada understands, of course; but it is not so generally known that it was the rush to the Klondike in 1898, drawing in with it the pick of the world's criminals, that caused the Royal North-West Mounted Police to drop their spurs and bridles and exchange them for snow-shoes and dog-whips. And, much to the general satisfaction, they have stuck to them ever since.

Three years have passed since the patrol started. What has been done during those three years it would take too much space to relate; but it may be safely assumed that they will not 'come outside,' as the expressive phrase of the northern traveller puts it, without results. For they, too, have traditions.

## THE WORKER'S HOLIDAY.

### PART II.

A LABOURING-MAN and a man who was fairly well dressed were standing at the counter, upon which were two great copper urns and slices of bread piled high upon plates. Behind the counter was a frowny girl, frying bacon.

He stood alongside the men and waited. The girl handed the fairly-well-dressed man a plate on which lay a slice of bacon and a fried egg. She then got a mug, that was chipped at the top, and filled it full of steaming coffee from one of

the urns. This, with two slices of bread, made up his order. He paid for it, gathered it up, and went off to one of the marble-topped tables that stood towards the back of the restaurant. On his way he stopped to get a knife and fork from a long wooden box.

The man who was very hungry watched his performance closely, for he would have to do the same thing. It was quite a simple performance—just as easy as getting up on the top of a bus. He got a coin from his pocket—a silver one this time—so as to be in readiness to pay.

'Addock, slice o' bacon, two slices o' bread, an' big coffee,' said the labouring-man to the girl behind the counter.

The girl swiftly and deftly dropped a piece of haddock into a small tin boiler, put a slice of bacon into the pan, and the order was ready almost as soon as it had been given.

Never had the new-comer seen such swift cooking; and he made up his mind to give the same order, for he had a weakness for haddock. He liked it very much.

The girl looked questioningly at him, and he gave the order. She looked hard at him, and paused. And for a moment he feared that something had gone wrong.

'Wouldn't you like to go up to the other floor, sir?' she said. 'We've got a special place.'

But he told her the place he was in would do very nicely. She looked at him now in a most interested way. She invariably treated her customers as though they were most inferior persons. But this customer was altogether different. She liked his manner very much.

'Oh, I think as you'd like the special place, sir,' she said again.—'Jimmy!' she called out to a boy with a moderately clean face who was sweeping the floor with a broom. 'Ere, show this gentleman to the room as is special.'

But he again assured her that the place he was in would do. The truth of the matter was that he was afraid to take chances. He knew what to do where he was!

She got the order ready, though not so quickly as she had got the one for the labouring-man. She kept turning round to look at her unusual customer. Why he was unusual she could not have told. He was not particularly well dressed. But there was something about him that impressed her.

'Ere it is, sir,' she said, pushing the plates gently towards him. She then turned and examined the mugs carefully, so as to find one that was not chipped at the top. When she got one to her liking, she filled it with coffee.

He put the coin on the counter, and she gave him the change. Then he took up the plates and the mug, and turned, leaving the change on the counter.

She called him back. 'You've forgot your change, sir,' she said.

He smiled, and told her to keep it.

'Oh, we don't take tips 'ere, sir,' she said.

He picked up the change, and went on and got a knife and fork from the long wooden box. Then he went over to a table that was unoccupied, and sat down.

He tasted the haddock. It was delicious. Never had he tasted such haddock before. It was perfectly cooked. And the bacon was also very good. The bread-and-butter—well, it was only so-so. But he was very hungry.

He found, however, that the coffee was beyond him. A taste of it was enough. It didn't seem to him to be coffee at all. No, he was unable to negotiate the coffee.

A man who was watching him closely from another table now came forward. 'Don't you like the coffee, mate?' he asked.

'Well, it is extremely good coffee,' he answered; 'but I don't care for coffee to-day.'

'I'll drink it for you, mate.'

He looked at the man. His face was pinched and worn. And then he saw what was the matter. The man was hungry!

'Won't you have something to eat, too?' he asked.

'Yes, mate,' said the other eagerly. 'I will. I'm out of luck. I can't get work.'

'Come on, then,' he said. 'I could do with some more myself.' And both men went back to the counter. He was full of confidence now. He knew what to do.

The girl smiled on him, but she had a hard look for the other man. 'We don't want people like you a-cadgin' off gentlemen,' she said severely. 'You get a small coffee, an' you just waits round, seein' what you can pick up.'

But the gentleman told her it was all right, and the hard look passed. She got him the same order again—this time without the coffee—and then she got the order ready for the other man. It was a big one, amounting to one and fivepence. But the man needed the food, and he considered it wise to grasp fully the luck that had come his way. As for the girl's comment, it had passed from him as water passes from a duck's back. His mode of life had turned him into a philosopher.

His companion's first opinion of the haddock was confirmed. He had never thought that haddock could be so delightful. And he determined that he would have it cooked exactly in the way it had been cooked now when he got back again to his usual round of life—the life that seemed so far away. He felt he would have trouble with the *chef*, though. He was a great artist, this *chef*, and he was paid a large salary. He would most likely think that it was beneath him to cook haddock in this particular way. But he made up his mind that he would go down himself personally into the kitchens and see that it was done. He would give instructions for the getting of a small tin boiler exactly like the one that was behind the counter. Yes, he would do this when he got back again. From

now on he would always have his haddock cooked just as it was cooked here.

'Say, mate,' said his guest, after he had eaten the food, 'ave you got a pipe o' baccy on you?'

'A pipe o' baccy!' For the moment he was puzzled; and then it came to him. The man wanted a smoke after his meal.

'I'm awfully sorry,' he said, 'but I've got no baccy with me. I'm so sorry. But I have a cigar. Perhaps you would like one?'

'Well, I likes baccy best,' said his guest critically; 'but I think as I might manage with a cigar. I can break it up an' fill it into me pipe.'

'That's a nice case as you've got,' he commented as he took the cigar. 'An' that's a nice cigar; I 'ardly likes to break it up. I thinks as I'll smoke it, an' keep the end for my pipe.'

'Yes, I would if I were you,' said the donor of the feast. 'You'll find it isn't at all a bad smoke. And—well, as you prefer baccy, perhaps you won't be offended if I ask you to get some for yourself with this;' and he pushed a coin towards him.

'Oh!' exclaimed his guest with profound astonishment. 'It's a sovrán, mate! It's a sovrán! Do you mean it? Do you mean it?'

He assured him that he meant it, and that it would give him the greatest possible pleasure if he would accept it.

'A sovrán!' he said with tears in his eyes. 'An' me so 'ard up! Oh, thank you, mate! You're a real toff. I'll be able to get a bed to-night. I'll be able to get a bed for a week. Thank you, sir.' And he put the sovereign carefully away into his pocket.

'What do you mean by getting a bed?' asked the other.

'W'y, sir, I 'aven't 'ad a bed for three nights. I've been dossin' on the Embankment.'

'The Embankment! How do you mean?'

The man saw that his benefactor did not understand. And he began to explain. 'W'y, sir, it's like this. I've got no lodgin's. I was turned out o' my room four weeks ago. Now an' then I gets a doss. But nearly every night since I've 'ad to sit out on the seats by the river. And now you come along, an' give me a sovrán. You're a gentleman, sir. Thank you.'

The man who held the position that was above all others felt a sudden shock. It was the first time in his life that he had ever been actually confronted with starvation and want. He had heard of it, of course, but he saw now that in reality he had never known anything about it. A curious, choking sensation came into his throat. This poor fellow! It was awful! One of his people!

'My dear fellow,' he said simply, 'I'm very, very sorry. I'm awfully sorry. Here's another sovereign. Cheer up, for I'm sure you will have better luck. Good-bye.' And he shook hands with him and left the restaurant.

He walked slowly back up the street, thinking.

He had been confronted suddenly with the black misery endured by those who have gone under. A veil had been torn from one of the aspects of the tragedy of the under-world. He had often heard of this world. Once he had read a book in which its life was described vividly. But it struck him now that to read a book about it was nothing. The only way to get to know about a thing was to be brought into personal contact with it. A book, however powerful, was after all only a second-hand shadow of real life. This poor fellow whom he had just left! His fate was an awful one. No place to sleep, and nothing to eat. He himself had never known the meaning of hunger as this man of the under-world had known it. And to have no place to sleep! It was terrible.

Still, life was a strange thing, after all. How joyful this man had been when he had made him the small present of money! He wondered if he himself had ever felt so joyful about anything. Surely he never had. This man must be now in the seventh heaven; for he would be able to get a bed for a whole week!

And then, somehow, it was as if the joy this man must feel came to himself. He felt elated. It was a fine thing to bring happiness to a human being, for the happiness came back to one's self. He felt now that he would like to go along doing good to those who were in want, and whom he met by chance. He would like to know things for himself. The knowledge that he had was not real knowledge. The education he had had was not a real education. His position had been to him as a wall of darkness that had shut out the real world—the immense, mysterious world that was now sounding around him. He would like to know it as other men knew it. Real knowledge. It was barred from him. It—

'Ere! What's up? Where are you goin'?'

A stout policeman—whom he had knocked up against as he was going along immersed in thought—was looking at him. His face was round and jolly of expression, and his voice was good-humoured in tone.

'You were walking in your sleep, I suppose!' he continued.

The man apologised.

'Oh, that's all right,' said the policeman. 'But mind and don't knock up against a lamp-post. You'll find it harder than I am.'

Both laughed, and then they talked together for a little.

'I must 'ave seen you somewhere before, sir,' said the policeman. 'Your face seems familiar-like. I wonder where I've seen you! Where could it be, now? Do you live round 'ere?'

'Oh, no.' He felt somewhat anxious, though he did not show it.

'Well, sir, your face is most familiar to me. When first I saw you I thought I could place you. But I can't, though your face is familiar—

most familiar. Oh, thank you, sir,' he went on, as he took and pocketed the healthy tip that had been offered. 'Thank you very much indeed, sir.' And the policeman went along on his beat. 'That's a bit of what you might call all right,' he said to himself. 'I wonder who 'e is! I know 'is face as well as I know my own; but I can't place 'im.'

He felt relieved when the policeman went off. Having a face that every one must be familiar with was somewhat awkward. But it occurred to him that, even though this was so, he was in no danger of being recognised; for no one would ever think that he would be walking about by himself in this ordinary way. The worst that could happen would be that some one would take him for being extraordinarily like himself!

He was back again at the gate of the great park; and he saw groups of men standing whilst they were being harangued by speakers. He had often heard of these groups; but he had rarely seen them. It was a good opportunity to go and hear what the speakers were talking about.

The first group that he joined was being harangued by a man with a long beard. He was talking about religion, and his views were most original. But his way of putting them was not very attractive, and men in the group were making all kinds of interruptions. But the speaker kept on as though the audience were giving him their best attention. He was evidently used to interruptions. In fact, he seemed to thrive on them, for occasionally he would get back at an interrupter in a way that made every one laugh. But, on the whole, he was not interesting, and the group gradually melted away, the members of it joining other groups.

Here was a speaker who had a new, or, rather, a very old, view concerning the earth and the heavenly bodies. He maintained that the earth was flat, and that the sun, and the moon, and the stars revolved around it. He had very hard words indeed for present-day astronomers. According to him, they were pretentious rascals of the deepest dye who had conspired together to dethrone the earth from its leading place in the scheme of the universe. He was a good speaker, and after listening to him for a while one felt that the earth was very flat indeed.

He passed from that group to another. A wild-looking man—who stood on a box—was addressing it. And suddenly his attention was riveted; for the man was talking about him!

For the first time in his life he was experiencing the rather dubious pleasure of listening to some one's real opinion concerning himself. His portrait was being drawn for him whilst he stood there, and, to be frank, it was not as flattering as it might be. For this wild-looking orator portrayed him as a scoundrel of the deepest dye.

'E's no good,' said the orator in strong,

harsh tones. 'It's 'im as is oppressin' us. 'E cares not a rap for anythin' but 'imself. But for 'im we'd be all well off. 'E's a curse to 'is country. 'E's a scoundrel. 'E does nothin', an' 'e 'as the best of everythin'. 'E does no work—not 'e. 'E never 'as done a stroke of work in 'is life. An' 'e gets 'undreds of thousands a year for doin' nothin'. It's a shame.' And he went along in the same strain.

The unfortunate, overworked man, who was now having the first holiday he had ever had in his life, listened to the wild-looking orator with the most intense surprise. At first he felt indignant. But his sense of humour came to his rescue. Evidently people knew as little about him as he knew about them. After all, life was a most amusing business.

When the orator had shown conclusively that he never did any work, he began to attack his private character. This pampered man, he asserted, led the most shameful kind of life. He was a disgrace to the community and to the world in general!

This was somewhat harder to stand. And for just an instant there came to him a wild desire to say something. But the desire passed, and he listened with philosophy.

A champion, however, appeared on the scene. He was a rough-looking workman. 'You're a ——— liar!' he shouted. 'You're a ——— liar!'

'Who's a liar?' exclaimed the orator.

'You are! I'm not goin' to stand 'ere an' 'ear you say that about 'im! 'E's a good sort,' he continued, mentioning his name, 'even if 'e doesn't do no work. 'E's a gentleman, an' if you say that again I'll come an' knock you off that ——— box.'

'I do say it again,' said the orator heatedly.

'Oh, you do!' exclaimed the champion, forcing his way through the group.

He got to the orator, and thrust him off the box. But just as he was about to strike him a policeman intervened.

'Ere,' he said majestically to the rough-looking workman, 'what do you mean? What are you interruptin' the meetin' for?'

'W'y!' exclaimed the champion, 'don't you 'ear what 'e's been sayin' about 'im?' again mentioning his name. 'You've been standin' 'ere all the time listenin'. You're no good yourself.'

'Look 'ere,' said the policeman with supreme dignity, 'you mustn't interrupt the meetin'. If you do I'll lock you up. If you want to 'ave a meetin', go an' 'ave one on your own.'

The champion subsided sullenly, but he did not move. He stood glaring at the orator, who had again got up on the box. He resumed his oration, but this time there was very little ginger in it. The glaring eye of the champion evidently disconcerted him. Finally the orator began on another subject.

So he had some one to speak up for him, after all! A rude but effective champion! He

felt absurdly pleased. Lofty though his position was, he was just as human as any one else. The policeman, of course, was right, but there are times when one may be too right.

He caught the eye of the man who had defended him, and he smiled. The man smiled back.

'It was only fair of you to speak as you did,' he said.

'Yes, mate; an' I'd 'a put it across 'im only for that copper.'

'Thank you. Would you mind accepting—this?'

'Oh no, mate,' said the man, deeply surprised. 'Thank you. But'—

'Oh, that's all right. Keep it to please me. It was very good of you.' And he walked off.

He had rewarded his champion, for he was very pleased indeed with the effort he had made on his behalf. He was like one of the champions of medieval times. A good, loyal fellow. His language was violently pure, but it conveyed what he meant with much clearness. Yes, he was very pleased indeed. The action of this working-man had taken the sting out of the wild-looking orator's remarks. So he was a man who never did any work! He smiled as he thought of what had been said. Well, well, it was a strange world!

It was now getting on in the afternoon. Nothing else had happened to him worthy of note. The great town was filled with soft sunshine. What a wonderful place it was with its millions of beings! A town of mysterious, interweaving sound. He had never grasped the vastness of it till now. Its immensity brought to him awe.

And the sense of his individuality had, in a way, become faint as he had gone along through the streets. His other self, to whom every one paid homage and deference, seemed now to be far, far away. He was only one of these moving millions of people who were going hither and thither, crossing and recrossing, going this way and that way—always going.

Would he really like to be one of these

people? Would he really like to lose his identity amongst them—to be absorbed, to be lost in the mysterious, immense whirl?

He was not as sure that he would now as he had been in the beginning of the day. Onerous though his position was, unreal though it was, he was still some one. A figure-head, but perhaps a significant one. To be swallowed up here in the millions! Well, perhaps he would not care about it. He did not know. But the glamour surrounding the idea of the adventures that would come to him, were he to live unknown here amidst these millions, was wearing away from him.

And there came to him a feeling that he would like to be back again to the round of his usual life. It did not seem to him to be so monotonous now. This day through which he had passed had been as a long time—as years. He was only a unit in the life of the world. He was no more than the homeless and starving man whom he had met in the restaurant. He was just one whom fate had placed in a certain position. He could no more help things than the man in the restaurant could help things.

He was just one who had to work hard for his bread. He saw himself now, as it were, from a distance. And he was going towards himself. He was going back again to take up his duty. He had had his holiday. He had had his look into the face of reality. It had been for him a strange and wonderful day. Would such a day ever come for him again? He did not know.

The shadows were lengthening in the streets of the great town as he got to the place agreed upon. There was his friend, looking worried and anxious. He came quickly forward, his face brightening up.

'Oh, I'm so glad you have come, sir!' said his friend. 'How was it? How did you get along, sir?'

'Oh, very well indeed,' he answered, smiling. 'I'm awfully obliged to you. Thank you very much. It was a real holiday. I enjoyed every moment of it.'

THE END.

## OF GERMAN SPIES.

**A**Severy one knows who has had much experience of it both before and during the war, the German mind touches at once the zenith and the nadir of intelligence. Its boasted genius for thoroughness is as often as not its undoing; for thoroughness without either mother-wit or imagination is a halting steed to ride in times like these even for a soldier. For a spy, it is knock-kneed.

With this limitation, Germans are born spies, and it is probable that many citizens of Berlin are directly descended from them that brought

back figs and pomegranates out of Canaan. Already in the German nursery tittle-tattle is encouraged by the *Hausfrau*, who, far from reproving her children for telling tales out of school, believes in dividing that she may better rule. The passion for espionage made thousands of Germans employed by British firms valuable to their British masters and priceless to their Government, since with a *fleur* for nosing out the business of rival houses they combined a thirst for general knowledge interesting to those who were arming against us. At the head of

them all stood their emperor. It was as a spy that he came so many summers to Cowes Regatta, and went, a self-invited guest, to the Swiss manoeuvres. Clear-headed men doubted his good faith even in those far-off days of peace and goodwill; but the nation as a whole ignored the danger, and the measure of our fatal trust is recorded in mile upon mile of little crosses in France, in Gallipoli, in Mesopotamia.

The German spy now confines his activities to the less risky theatre of neutral countries, in which, acting in this capacity, many Germans of military age, willing to wound and yet afraid to strike, find a safe and fruitful sphere. Switzerland in particular, which offers unique advantages, with one enemy to the west and another to the south, has a perfect plague of these wasps; but, thanks to the complex German mentality above referred to, most of them are without sting. They devote themselves with pathetic zeal to the minutest detail, yet fail consistently in larger perspectives. They glue their eyes to microscopes where the naked eye would often serve their purpose better. They eavesdrop for whispers, and miss information that they could hear openly in the public places. They find something irresistible about a keyhole. They scavenge in dustbins where they should search faces. They are melodramatic in their movements, and their disguises are grotesque. They employ for preference waiters, tramps, women of the town—in short, any one and every one before whom no one but a fool would say anything worth hearing.

Now and then, indeed, their methods of acquiring information verge on the ludicrous. It happened that, during the third year of the war, Berlin wished to inform itself as to the supposed change of opinion in a certain Swiss city which had heretofore been pronouncedly pro-German, an attitude in great measure due to fear rather than to affection. Reports, not wholly devoid of truth, must have crossed the Rhine of a growing movement in favour of the Entente, and the German Spy Bureau promptly set to work to ascertain the extent of the damage. And how did it proceed? Not by the hundred and one tactful ways that would have suggested themselves to any nation of finer calibre, but by the question direct, the surest way of getting an estimate at once flattering and untrue. In brief, an *interné* employed at the German Consulate, but, unlike the majority of his class, dressed in

mufti, made a house-to-house visitation in every shopping quarter of the town, purchased some small article, got into conversation with either the proprietor or the assistant, and then, barely outside the front-door, noted the result down against the address in the bulging notebook. Needless to say, the purpose of his visit became public within the hour, with the result, no doubt, that he was able to give his employers the comforting assurance that the alarmist reports of pro-Entente sympathies were without foundation, and that the retail traders at any rate were *deutsch gesinnt* to a man. The present writer would have deemed such comic-opera folly incredible if he had not actually encountered the man more than once on his futile round.

Of course, there are occasional gleams of better things, but for the most part German ideas of espionage only further illustrate that the genius of that nation is, first and last, an infinite capacity for taking pains, unrelieved by imagination or instinct. Perhaps the brightest inspiration of late was when the Spy Bureau planned to send its agents over the Franco-Swiss frontier disguised as smugglers, and provided with packets of ferro-silicilate, saccharine, cigar-lighters, or some other easily obtainable contraband. Though it went agley, the plan was not bad, since detection meant, at the worst, the light penalties inflicted on smugglers, while success would have involved hobnobbing with the French outposts and bringing back valuable information. On the whole, it was a promising venture, and might well have borne fruit but for a little hitch which no one would be more likely to overlook than a Prussian.

Detail, whether of importance or not, is the fetish of the German spy. He takes an unaccountable interest in the most trifling movements of Entente Consular and passport officers. He posts himself at street-corners, so that he can note the fact that the French Consul goes to church after breakfast, that the Italian Consul walks home to lunch and returns by tram, or that the English Consul occasionally takes his pleasure in the public swimming-bath. His master is kept informed of every restaurant or private house at which these gentlemen take their meals. All this seems fantastic, but it is a fact, nevertheless, and the meticulous care with which these extravagant trifles were recorded came to light more than once in a manner that left no doubt of the labour devoted to such foolery.

## THE SHIP THAT SAILED ON FRIDAY.

By ROLF BENNETT, Author of *The Adventures of Lieut. Lawless, R.N. ; Captain Calamity ; &c.*

SOMEHOW, despite improvements and sanitation and the substitution of dingy red brick for rich old timber, Wapping still retains some of its ancient picturesque qualities, as any one

may see who cares to take a trip down the river. Viewed thus from the water, it looks much as it must have done a hundred years ago or more; and the swirl of black water, eddying beneath

the forest of wooden piles, stunted piers, and old wharfs, is grimly suggestive of dark deeds that used once upon a time to be enacted there when Ratcliff Highway was the haunt of the crimp and ships still weighed anchor to the tune of the fiddle and the chanty.

Nearly all the old wooden houses have been demolished, but there is, or was until quite recently, a tavern there which has altered but little during the hundred and fifty odd years of its existence. And here it is that the barge skippers and the barge mates and the river 'hufflers' congregate, hold their sing-songs, drink, and—sometimes—fight. Many of these men have in their younger days been deep-sea sailors, and there is not a port in the world, from Iquique to the Clyde, that, sooner or later, you will not hear discussed there.

And it was here, in the bar-parlour with its sanded floor and old oak beams, that I met the sailor-man.

He had given up the sea, and was employed ashore in checking barge cargoes or something of that sort—he did give it a name, but I have forgotten it. And it was he, when in a mellow mood one evening, who told me the tale of 'Jerry's Keg.'

'There's a place called Turk's Island, about five days' sail from Jamaica, in the Caribbean Sea,' he said. 'I don't know why it's called Turk's Island, because there ain't no Turks on it, nor never was, so far as I know. But it's called that. The only things the island produces is salt and donkeys, and it produces them in the natural state. There ain't no vegetation there worth mentioning, and there ain't no fresh water except what the folks catches in their water-butts when it rains. Well, what with no grass nor herbage of any sort worth calling such, and the scarcity of water and the tremendous quantities of salt, the donkeys have a hard time of it. How they manage to live and breed at all I don't know. But they do, and when they have an extra dry spell, when even the puddles from the last storm have dried up, the donkeys troop into the village and try to get at the water-butts. All of 'em, big uns and little uns and baby donkeys—they come in at night, and you can hear the patter of their hoofs on the stones.'

'Well, there was a man in Kingston, Jamaica, who used to trade in donkeys. He had a little schooner, and every now and again he'd take a trip to Turk's Island, load a cargo of donkeys, and sail back with 'em to Jamaica. Sometimes he'd go to Bermuda as well, but generally he took 'em to Jamaica and sold 'em there. His name was Jerry; leastways we always called him Jerry, and I never heard him called anything else. Whether it was his surname or his Christian name I don't know, but seemingly it was the only name he had, and he was quite contented with it.

'Now, at the time I'm speaking of I was adrift in Kingston. Owing to circumstances there ain't no call to mention, I'd missed my ship, and she'd sailed without me. So I was on my beam-ends, as the saying is, with not even a black penny in my pocket. Mind you, I've been adrift since then in worse places than Jamaica, but I was young at the time, and hadn't much experience. Well, one morning I was sitting on the wharf watching the niggers load bananas on an American boat. I almost wished I was a nigger myself. I'd tried to get a berth on board the American boat and another that was there, but I hadn't no discharge-papers, and the mates wouldn't look at me; in fact, they were right-down rude.

'So I sat down a-ruminating and thinking what a shame it was that a man who was willing to work couldn't get a thing to do, when up comes Jerry. He was smoking a cigar, and wearing a white drill suit and a straw hat, and looking shiny and prosperous.

"Hello, Tom!" says he.

"What cheer, Jerry?" says I.

"Want a job?" says he.

"Ho no," I answers, "I don't want no job; can't you see I'm here for me health? Doctor said me failing constitution needed a warm climate, so that's why I'm here. Lovely view, ain't it?"

The old blighter started to laugh then, and when he'd finished he give me a slap on the back that nearly sent me over the quay-side to feed the sharks.

"I'm taking a voyage to Turk's, and I want a mate for the *Squirrel*," says he. "How about it, my lad?"

"Not so much of the 'my lad,'" says I. "What are you offering?"

He looked a bit surprised-like, which was only natural. He'd figgered on me jumping at the job at maybe half the usual rate of pay, he being a rare hand at a bargain. He was a tough 'n in his own way, was Jerry, and if anything hurt him worsen than the rheumatics, it was parting with money. Ay, he was a real old miser, and owned a row of shacks back of Harbour Street.

"Oh," says he, seeing, I suppose, that I wasn't shipping at sale price, "the usual."

"Good enough. Then I'm your man," I answers.

'So we fixed it up and wetted it—he didn't like that, but I made him stump up the price of a rum; and then he told me he was going to take a passenger. A scientific gent he said he was, who wanted to study donkeys in their natural state, or maybe it was the salt or the prickly cactus. Anyway, I forget now which it was, and it don't signify. Likewise, there was some cargo and the passenger's luggage.

'It was a Friday when we sailed, and a more unluckier day you couldn't hit upon. But it

was the scientific gent's fault. He said he'd made arrangements to sail that day, and Jerry agreed to it on the strength of an extra quid. If that wasn't tempting the devil, I'd like to know what is. But there, some men will do anything for money, and Jerry, as I've told you, was a rare coin-collector.

'So we got the cargo and the gent and the luggage aboard the *Squirrel*—which was the name of Jerry's old wind-jammer—and was soon bowling out of Kingston Harbour before a stiff breeze. The breeze held, and on the third day out the gent asked Jerry when he expected to sight the land.

"Well, if the wind holds through the night, we ought to see Turk's to-morrow evening," answers Jerry.

'The wind did hold, but come the next evening there was no sight of land, and the next morning there was no sight of land.

"That's queer," Jerry says to me; "we ought to have hit the island twelve hours ago."

"Maybe you've mistook your reckoning," says I.

"Not me," he answers. "I've done this run fifty times, if I've done it once."

'And then the scientific gent comes up and asks how it is we ain't at Turk's per promise.

"Oh," says Jerry, "it's all on account of the currents hereabouts. Sometimes they'll take a ship a hundred miles out of her course. But we'll be at Turk's to-morrow morning, you can take my word for it."

'But come the next morning there was no sign of Turk's Island, nor any other island. There wasn't no sign of land at all. Everywhere you looked there was sea, and nothing but sea.

"Durned if I understand this," says Jerry. "I've never knowed such a thing happen before."

"Perhaps you never sailed on a Friday before," I answers.

"I never did; but I don't see what that's got to do with it," he says. "I don't believe in them silly old suspicions. Friday's as good as any other day."

"Is it?" says I. "Then why are we still at sea, and we running before as good a wind as you'd wish to get?"

'He didn't answer this; and presently along comes the scientific gent and wants to know why we ain't made Turk's Island yet.

"It's because of the season of the year," answers Jerry. "About this time there's always a ground swell, which retards the impetus of the vessel by offering a counter-attraction to the momentum of the propelling forces."

'I don't know whether that satisfied the gent; but, anyway, he said no more that day. Well, the next day came, and still there was no sign of Turk's Island; and the next was the same, and

the next after that. By this time the scientific gent was real angry, and Jerry, I could see, was at his wits' end. He swore he was on the right course; and, sure enough, when he showed me the chart, it was laid out all proper and correct. The worst of it was, we were running short of grub and water, and had even killed the pig which we'd taken on board in case of emergencies.

'Well, sir, early the next morning we was heartened by the cry of "Land ahead!" and, sure enough, there it was on the horizon.

"There!" says Jerry to me scornful-like. "How about your Fridays and unlucky days now?"

"You hold on a bit," I answers; "we ain't in port yet."

'Well, as we drew nearer to the land it got bigger and bigger, and we saw that, whatever else it might be, it wasn't Turk's Island.

"Seems to me," says Jerry, who'd been looking at it through his spyglass—"seems to me," says he, "that there's something durned familiar about the lay of that land."

'So I took the glass and has a peep.

"You're right about that there land looking durned familiar," says I; "we're sailing back to Jamaica!"

'And so we was, without a word of a lie. It was an absolute fact. We was heading straight for Kingston Harbour, and you could sniff the rummy smell that always comes off the island when the wind's in a certain quarter. Yes, sir, we must have made a great big circle and come right round on our track. I'd never see'd the like before. Laugh! I had to laugh; I jest hung on to a shroud and laughed and laughed and laughed. And Jerry hit me over the ear with a rope's end, and still I laughed. Then he kicked me down the fo'c'sle hatch, and I lay at the bottom and laughed. It was the limit; it was the greatest voyage on earth.

'But Jerry didn't laugh. No, sir; he cussed and cussed and cussed. There wasn't a madder man, ashore or afloat, than Jerry that day. He didn't know how to hold hisself. I thought he'd blow up, or have a fit, or run amuck. Wild! You can't guess how mad he was. He didn't see the joke, mind you! Didn't see anything funny in it at all. Neither did the scientific gent. He didn't cuss, but he told Jerry just what he thought of him and his schooner and his navigation. He chewed him up proper. He didn't say much, but what he did say was to the point. He hit the nail on the right spot every time. The way he expressed himself was marvellous, considering he didn't cuss. I wouldn't like to be talked to that way myself—I wouldn't that.

'Well, Jerry blamed it all on to the boy who'd took his trick at the wheel sometimes. The boy'd never been to sea before, but he'd

been allowed to steer off and on, mostly during Jerry's watch, Jerry sleeping in the meantime. That boy got the sack to once, and Jerry shipped a man this time. Because, d'you see, Jerry'd contracted to take the scientific gent to Turk's Island, and the scientific gent held him to it, as there wasn't any other boat leaving just then for Turk's.

'So we set sail once more, Jerry seated on a big keg, steering himself.

"I ain't taking no chances this time," he says; "no more boys for me."

'We had pretty fair winds, and Jerry reckoned we ought to make Turk's about the evening of the fifth day. But we didn't. No, sir, not on the fifth day, nor the sixth, nor yet the seventh. We didn't make no land at all. And the scientific gent kept asking him when we should get there, and Jerry kept telling him lies, and at last we sighted land.

"I knew we'd get there," says Jerry; "it was that durned boy."

'But I didn't say nothing, because I had me suspicions.' And the more I looked at that there land the more suspicions I had. And then Jerry began to have suspicions.

'The scientific gent came on deck, looked at the land, and he began to have suspicions. "Surely Turk's Island has not such a long coast-line as that," says he. "I understood it was quite a small island."

"'Tain't Turk's Island," groans Jerry; "it's Jamaica. We've come back again."

'Yes, sir, we'd done the same thing as before. Been and sailed round in a circle, and come back to where we'd started. It's the truth I'm telling you.

'Well, Jerry was that flabbergasted, he didn't know what to do. And this time I didn't laugh. No, sir; it had got beyond a laughing matter. There was something uncanny about it. Seemed as if the ship was bewitched. I'd never sailed in a bewitched ship before, but I'd heard about 'em. They ain't healthy places to be in. So I didn't laugh.

'This time the scientific gent was real mad, and he gave it to the skipper hotter'n ever. He didn't cuss, but he let him have it. Yes, sir, the things he said to the skipper, and the way he said 'em, fairly made me sit up. And when the scientific gent had done saying things, he makes a suggestion. "There's only one plausible explanation," says he, "which is, that your compass is out of order."

"Lord! now why didn't I think of that before?" answers Jerry. "Why, that must be it, of course. I'll take the compass ashore and have it tested."

'He did, and the bloke what understands that sort of thing told him the compass was all right. It had a variation of about ten west, but Jerry knew that, and always made allowance for it. So it wasn't the compass.

'I think Jerry would have given up ever going to Turk's Island any more, but the scientific gent held him to his bargain. And it wasn't no bargain for Jerry. What with the time he'd wasted, the money he'd paid in wages, and the cost of the grub, he was already at a dead loss. He told me so himself. However, there was nothing for it but to have another try; so we took on fresh provisions, Jerry bought a new chart, and we lifted our mud-hook once more.

'Five days passed and there was no sign of Turk's Island, likewise six days and seven days. On the eighth day we sighted land, but we didn't wager it was Turk's Island. No, sir; we'd got suspicions by this time. Well, it wasn't Turk's Island; it was Jamaica, and we'd sailed round in a circle, same as before.

'This time I'd made up my mind that the ship was bewitched and the scientific gent a Jonah. How else could you explain it? A thing like this had never happened before, so far as I'd heard tell of. There was a cuss on the boat, and maybe on us as well. I didn't like it. No, I was very far from liking it. To tell the truth, I was skeered.

'So was Jerry. He didn't understand it no more'n I did. When I told him about me suspicions he pretended to laugh. All the same, he was skeered too. You couldn't blame him.

'By this time the story of our trips had got about. Half Jamaica came to look at the bewitched ship. And that gave Jerry an idea to make good some of his losses. He charged sixpence a head to whites and threepence a head to blacks to come on board. And they flocked on board. Yes, sir, they came in shoals, and we couldn't take the money fast enough. Not, mind you, that there was anything to see, but I s'pose they just wanted to brag about having been aboard a bewitched vessel. I dare say it sounded adventuresome to them.

'And this time the scientific gent didn't get mad. He said it was a most interesting and mysterious phenomenon. He said he was going to write to the scientific papers about it.

"Possibly," says he, "we have met with some strange and rare atmospheric force. I must look up the records," says he; "perhaps there are other instances. Or perhaps there has been a submarine volcanic disturbance, thus creating a new sub-current, too recent to have been noted. We will try again," says he.

'So he makes a new contract with Jerry; and a day or two later, when nearly every person on the island had paid to come aboard and look at us, we hove the mud-hook and set sail. And the scientific gent stands by the wheel and looks at the chart and the compass, and the way Jerry was steering. He had been doing this on and off for about three days, when, as he was standing

by Jerry one afternoon, he suddenly gives a yell.

"I've got it!" he shouts.

"Got what?" asks Jerry, thinking maybe he'd suddenly had a sunstroke.

"Why, the secret of the astonishing phenomenon," answers the scientific gent. "You're sitting on a keg," says he.

"Sure I am," answers Jerry.

"And every man who's steered this boat since our first trip has sat on that keg when at the wheel?"

"Yes," says Jerry.

"How long have you had that keg on board?"

"Took it on board when you came; it's part of the cargo," answers Jerry, fair mystified at all this.

"And what's inside it?" asks the scientific gent.

"Nails," says Jerry.

'That,' said the sailor-man, rising from his chair, 'is about all there is to it. Them iron nails, being up against the compass, had thrown it all out of gear. And none of us had never guessed it. But I can tell you Jerry didn't have no keg to sit on for the rest of the trip, and you can bet your bottom dollar we didn't make Jamaica that time.'

#### GOD GUIDE AND GUARD OUR SAXON TONGUE.\*

By the Rev. JAMES GILBORNE LYONS, LL.D.

Now gather all our Saxon bards,  
Let harps and hearts be strung,  
To celebrate the triumphs of  
Our own good Saxon tongue;  
For stronger far than hosts that march  
With battle-flags unfurled,  
It goes, with FREEDOM, THOUGHT, and TRUTH,  
To rouse and rule the world.

Stout Albion learns its household lays  
On every surf-worn shore,  
And Scotland hears it echoing far  
As Orkney's breakers roar—  
From Jura's crags and Mona's hills  
It floats on every gale,  
And warms with eloquence and song  
The homes of Innisfail.

On many a wide and swarming deck  
It scales the rough wave's crest,  
Seeking its peerless heritage—  
The fresh and fruitful West:  
It climbs New England's rocky steep,  
As victor mounts a throne;  
Niagara knows and greets the voice  
Still mightier than its own.

It spreads where winter piles deep snows  
On bleak Canadian plains,  
And where, on Essequibo's banks,  
Eternal summer reigns:

\* This poem, so suitable for the times, was first printed in *Chambers's Journal* in the year 1849, and came from the pen of a clergyman in Philadelphia.

It glads Acadia's misty coasts,  
Jamaica's glowing isle,  
And bides where, gay with early flowers,  
Green Texan prairies smile

It lives by clear Itasca's lake,  
Missouri's turbid stream,  
Where cedars rise on wild Ozark,  
And Kansas' waters gleam:  
It tracks the loud, swift Oregon  
Through sunset valleys rolled,  
And soars where Californian brooks  
Wash down their sands of gold.

It sounds in Borneo's camphor groves,  
On seas of fierce Malay,  
In fields that curb old Ganges' flood,  
And towers of proud Bombay:  
It wakes up Aden's flashing eyes,  
Dusk brows, and swarthy limbs—  
The dark Liberian soothes her child  
With English cradle hymns.

Tasmania's maids are wooed and won  
In gentle Saxon speech;  
Australian boys read Crusoe's life  
By Sydney's sheltered beach:  
It dwells where Afric's southmost capes  
Meet oceans broad and blue,  
And Nienweld's rugged mountains gird  
The wide and waste Karroo.

It kindles realms so far apart  
That, while its praise you sing,  
These may be clad with autumn's fruits,  
And those with flowers of spring:  
It quickens lands whose meteor-lights  
Flame in an Arctic sky,  
And lands for which the Southern Cross  
Hangs its orb'd fires on high.

It goes with all that prophets told,  
And righteous kings desired,  
With all that great apostles taught,  
And glorious Greeks admired;  
With Shakespeare's deep and wondrous verse,  
And Milton's loftier mind,  
With Alfred's laws, and Newton's lore,  
To cheer and bless mankind.

Mark, as it spreads, how deserts bloom,  
And error flees away,  
As vanishes the mist of night  
Before the star of day!  
But grand as are the victories  
Whose monuments we see,  
These are but as the dawn which speaks  
Of noontide yet to be.

Take heed, then, heirs of Saxon fame,  
Take heed, nor once disgrace  
With deadly pen or spoiling sword  
Our noble tongue and race.  
Go forth prepared in every clime  
To love and help each other,  
And judge that they who counsel strife  
Would bid you smite—a brother.

Go forth, and jointly speed the time,  
By good men prayed for long,  
When Christian states, grown just and wise,  
Will scorn revenge and wrong;  
When earth's oppressed and savage tribes  
Shall cease to pine or roam,  
All taught to prize these English words—  
FAITH, FREEDOM, HEAVEN, AND HOME.

## SEVENTH SERIES

### JOCK'S NEEBORS.

#### TALE OF THE MALTA HOSPITALS.

By ALBERT G. MACKINNON.

#### CHAPTER I.—NUMBER ONE.

'ANE'S neebors are o' as muckle importance as ane's medicine,' muttered Jock McGowan to himself, as he cast a sly glance at the new patient the orderlies were lifting into the next bed.

'He's a Hielan'man, onyhoo. I ken that frae his bonnet.'

Jock was by nature inquisitive, and his mind fastened on any new fact like flies on sugar. That it took the form of a new face made him all the keener. Impatiently he waited until the surgeon and the nurses had transformed the dishevelled, khaki-clad figure into a respectable hospital patient.

Then, turning on his side and facing the new-comer, he asked, 'Are ye verra bad?'

'I'm mair gled than onythin' else,' was the reply.

'Why that?' asked Jock.

'Because I'm no deid,' said the other. 'I was gey near it.'

Jock settled himself comfortably to listen to the story, which he saw the other was as eager to tell as he to hear. The fire in the eye, the startled expression, were evidently the aftermath of some thrilling experience.

'I was lyin' i' my bunk half-awake at the time,' began the stranger, 'when a' o' a sudden I heard the crackin' o' the ship's sides just below me, an' in there glided intil oor compartment somethin' verra like a shark, only it was dark an' shiny. It went richt across the room an' struck the opposite wall. Then it burst, an' for a moment everythin' seemed to be flyin' everywhere. I got this gash on the back o' my heid; but I had ither things to think o' than wounds, I can tell ye. Afore I could get up the sea came pourin' in like a waterfall. It rose up an' up until it reached the level o' my bunk; then it covered me, an' mounted richt to the ceilin'. Chairs an' bits o' tables were dashed about i' the swirl. The stairs leadin' to the deck above had been blown awa'. I couldna swim richt, but I felt for the beams o' the deck above me, and grippin' them, pulled myself along to where the stairs ought to hae been. There I found the way blocked by everythin'

that could float, for by this time the water had risen to the height o' the second deck above me, an' ane micht a'maist think that chairs an' tables were alive, the way they scrambled to get oot o' the sma' openin'.'

The speaker hesitated, and paused, while he cast a searching look at Jock. 'Na,' he said, almost more to himself than his listener; 'I canna tell ye the noo this bit o' it. Mebbe I wull again; mebbe no. A' I can say is, I did a terrible mean thing under the water. Mean is no the richt word, but it wull dae the noo. Onyhoo, I managed to get through the openin', an' struggled up to the next companion-way. By this time I was swallowin' water an' giein' myself up for lost, when a haund reached down an' gripped me, an' pulled me up on to the deck. I can tell ye I was never sae gled to see the licht o' the sun afore; but my dangers were only beginnin'.'

'I should say that ye had had yer share a'ready,' interrupted Jock, whose eyes were glistening with the delight of a boy reading a penny-dreadful.

"To him that hath shall be gi'en," is a sayin' that's ower true to life,' continued his neighbour. 'There was a boat bein' launched, an' as I was ower weak to move, they bundled me intil it, an' I lay in the bottom o' it while ither jumped on tap o' me, until I thoct that they wad never stap jumpin'. The boat was ower full to manage, an' afore they could dae onythin' to prevent it she drifted richt under the screw. From where I was lyin' I could see a big blade comin' slowly down on tap o' us. It seemed ages, but it was only seconds. It took its time, just as if it knew that we couldna get awa'; then, wi' a horrible crashin' sound, it cut the boat fair in half. It missed my feet by a few inches. Next it began to toss bits o' the boat an' men frae the ane blade to the ither. It was awfu', I can tell ye. Hoo I managed to get oot o' the grip o' that propeller I dinna ken. Somehoo the sea caught me an' drew me aside. Noo I thoct the end had come. I had no life-belt on. That had saved me at the first, for if I had been wearin' ane

I could never hae pushed my way through the mass o' floatin' things that blocked the way oot o' the cabin. Noo it saved me again, for I came to the surface near a boat, an' its skipper, seein' that I had no belt, an' therefore a puir chance o' savin' mysel', took me in; an' here I am, mair deid than alive.'

'Ye're gey hard to kill,' was Jock's consolation, 'an' if the torpedo an' propeller failed to dae for ye, I'm thinkin' ye'll get through the doctor's haunds a' richt. I see frae yer board that yer name is Graham. Ye'll no be from verra far north?'

'Kilmachie, if ye ken whaur that is; an' if ye dinna, I can tell ye that it is whaur I wad like to be the noo.'

'Wi' some bonnie lassie, I'll wager,' was Jock's sally.

'Mebbe,' drawled the other in a meditative way. 'There's ane I wad like weel enough to be wi'; only, man, my conscience is no richt, somehow. I never thocht afore it could gie a man sae muckle trouble. It's worse than my wound, by a long sight.'

'Why, what hae ye bein' daein', that ye're sae cut up?'

'No playin' the game. That's hoo best to pit it,' groaned the other.

'Fechtin'?' persisted the inquisitive Jock.

'Na; courtin'. I hae ta'en a mean advantage, an' noo that I hae won by unfair means I wad rather hae lost in a clean contest.'

'Well, if ye feel like that, gie her up to the ither chap.'

'I canna.'

'Why?'

'He's deid.'

'Then that gies ye a clear field.'

'Na; ye dinna understaund, an' I'm no gaun to explain the noo.' With that, Graham turned over on his other side, and Jock was left staring at a shock of tousled hair.

'He's got somethin' on his conscience, sure enough,' M'Gowan thought to himself. 'But I'll mak' him bring it up yet, though it looks gey like comin' up o' itsel', he's sae uneasy about it. I'll gie him time.'

For the remainder of the afternoon and evening nothing was said. The night crept on, the lights were lowered, and the silence of midnight hushed all the sounds of the ward. Jock slept with one ear half-open. He was expecting something, and when suddenly he heard the whisper, 'Jock! Jock!' he was not surprised.

'Ye're no sleepin', are ye?'

'Na,' replied Jock; 'only tryin' to.'

'Weel, I'm deein', an' I thocht ye wad like to know.'

'Ye're richt. I wadna hae kenned if ye hadna teld me.' Jock could use the weapon of sarcasm to some purpose.

His neighbour raised himself, and cast a

suspicious glance at the speaker; but Jock's face, belying his voice, expressed only sympathy.

'I've made my wull.'

'Then there's nae fear o' yer deein'. It's only those who forget a' about wulls that are taken sudden like. That's hoo the lawyers thrive; they maun hae a secret compact wi' the deil to tak' the wull-less anes first, an' gie those left somethin' to quarrel ower.'

Graham thought for a few minutes. 'Mebbe ye're richt,' he said. 'Onyhoo, I want ye to keep my wull. I wrote it oot on this piece o' paper. I hae left a' my property to Dugald M'Callum, the man I took the mean advantage o'.'

'But I thocht ye said that he was deid.'

'Sae he is. But I wad like it to gang to his freends, an' not knowin' who they are, I hae pit his name in. The lawyer wull see that the richt folk get it. I kind o' feel that it's his money, an' that he should hae the richt disposin' o' it. He'll hae named his heirs. It's a' I can dae noo to richt maitters, an' I'll gang wi' an easier conscience.'

'I'll tak' the paper,' said Jock, holding out his hand for the leaf, which had been torn from a writing-pad, and on which was scribbled the 'Last Will and Testament of David Graham, farmer, Kilmachie.'

'I see ye hae signed it a' richt. That's the maist important part o' it. Weel, if ye gang I'll haund it to the lawyers. Ye're sure M'Callum is deid?' Jock's question was intended as a bait to draw out the secret that was troubling his neighbour, and fretting his own inquisitive nature.

'I've only ower guid a reason for knowin' it. I killed him mysel'.'

The confession was made in low, solemn tones that emphasised the terrible nature of the deed; and Jock, fully satisfied that now the whole truth was coming forth, settled himself comfortably in his bed to listen.

'Ye see,' continued Graham, with some satisfaction that he had got a sympathetic hearer and an opportunity of easing his conscience, 'Dugald an' I were lads thegither, an' the best o' freends a' oor lives until Mary M'Millan cam' to stay wi' her uncle i' the parish. Then somehow we fell oot. He didna see that I had the best richt to her, haein' a guid farm o' my ain where I could gie her a comfortable hame, while he had practically naethin'—except his looks, an' I'll admit he was weel set up. Sae I told him straight ane day to keep oot o' my way, an' he laughed i' my face, an' said he would save Mary M'Millan from makin' a fool o' hersel' by marryin' a mau wi' ears an' a nose like mine. After that we never spoke anither word to each ither until we met on the transport. Baith o' us had enlisted, an' oor drafts were sent East thegither. He was lyin' i' a hammock no five yairds frae me when the torpedo struck us. I

saw him tumble intil the water just behind me. A few seconds after, when I was fechtin' my way up to the openin', I felt the grip o' his haund on my leg. I micht hae pulled him up, for I had strength enough left for baith; but I remembered what he said aboot my nose, an' I thoct what a puir time Mary wad hae if she was fool enough to marry a man wi'oot a penny. Sae, to save her—an' oot o' a bit o' revenge, I wull admit—I gave him a vicious kick that sent him to the bottom, an' he never rose again. Sae, ye see, I've got somethin' on my conscience, an' if I should meet Dugald i' the next world I wad

like to be able to tell him that I had done the best I cou'd for him afterwards by way o' amenda.'

'I understaund,' responded Jock sympathetically. Then, satisfied that he had got the whole story, and that there was nothing left to tell, he added, 'Noo, gang to sleep; it wull dae ye a heap o' guid. An' dinna fash yersel' aboot the wull; I'll no forget it.'

So saying, he ended the interview by turning over and showing that example is better than precept.

## SWEDISH IRON FOR GERMANY.

By GEORGE LINDESAY.

**I**N a series of articles recently published in the Copenhagen press, the vast iron deposits of Sweden are described. In view more especially of the extent to which Germany has benefited by them, the following summary may be interesting to British readers.

Iron ore is found mainly in two different parts of Sweden, of which Lapland, in association with the names of Kiruna and Gellivara, is perhaps the one best known. But considerably farther to the south there is a broad belt of iron-producing country, the so-called 'Mellersta Sverigis Bergslagen,' central Sweden's mining district, which includes the valuable properties of Dannemora and Grängesberg.

The term 'Bergslagen' is familiar in connection with the important and well-managed railway of that name which runs from Gothenburg to Stockholm, to the north of the lakes Venern and Vettern. Here it may be remarked that for the traveller this is a most interesting route, passing as it does through the great forest and iron districts of Vermeland, Dalarne, Nerike, and Vestmanland, where the inhabitants obtain their living from the interior of the earth and from the woodlands.

The mining district of central Sweden lies between the 59th and the 61st degrees of latitude, and includes Stockholm's, Upsala's, Södermanland's, and Örebro's Lehn, the eastern part of Vermeland, and the southern parts of Kopparberg's and Gevleberg's Lehn. It has a total area of about fifteen thousand square kilometres. Farther south the iron ore deposits are of minor importance, the largest being at Taberg, in the Jönköping neighbourhood.

The other great iron-producing region is Lapland, land of the Midnight Sun and of everlasting snow. As Scania is the granary of Sweden, so is Lapland her treasury. At Kiruna alone there are some 200,000,000 tons of ore.

These deposits are situated mostly within the Arctic Circle, in the districts of Gellivara and

Jukkasjärvi in the north-western part of Norrbotten's Lehn, and between the 67th and 68th parallels of latitude. Within this tract of country, which has an area of eight thousand kilometres, lie Sweden's most valuable deposits of iron, Kiruna and Gellivara, from which of late years such vast quantities have been taken, Tuollavara, and the as yet untouched Luossavara, Svappavara, Leveäniemi, Ekströmsberg, and Mertainen. Outside these districts iron ore in any considerable quantity is only found at Ruotevara, in the Kvikkjok neighbourhood.

All the ores in the above-named mines consist either of magnetic or hematite iron or both, in more or less intimate association with certain minerals, quartz, calcareous spar, apatite, chlorite, &c. The different types of ore are represented both in central Sweden and in Lapland.

The Swedish ores contain as a rule 60 per cent. of iron; the average for the rest of Europe is calculated to be 36·7 per cent., and for the whole world, including Sweden, 45 per cent.

The extent of the deposits varies greatly. In central Sweden the medium-sized ones are from five to ten metres in width, and from two to several hundred metres in length. In some exceptional cases they have a thickness of from twenty to thirty metres, and in two places—Grängesberg and Stråssa—as much as from ninety to one hundred and ten metres, with a length respectively of four hundred and two hundred metres. In Norberg continuous ore is found for a distance of twelve hundred metres, and at Grängesberg for one thousand metres.

As a rule the ore deposits are of larger dimensions in Lapland than in central Sweden. Thus the ore at Kirunavara is from twenty to one hundred and ninety-six metres broad, or on an average fifty metres, for a distance of three thousand metres; that at Gellivara has a breadth of one hundred metres; and that at Ekströmsberg a breadth of from twenty-two to fifty-two metres, with a length of twelve hundred metres. The Luossavara-Kirunavara tract of ore is about

seven thousand five hundred metres, and the so-called 'Stera Malmen' at Gellivara is five thousand metres in length.

The Swedish iron-mines are not, as a rule, deep. Only seventeen of them go down three hundred metres, and only one of them farther—five hundred metres. In none of these places has the ore at the greatest depth attained been found to differ in quality from that nearer the surface, nor have the dimensions been found to vary.

Diamond-boring has been tried, especially in Lapland, in order to ascertain how far down the ore extended; and by this means it has been proved that at Kiruna considerable quantities exist at a depth of five hundred and forty metres below the top of the mountain, or three hundred metres below the surface of the lake Luossa-Järvi, which lies at its foot.

Two years ago estimates were sent to the International Geological Congress with regard to the contents of the Swedish iron-ore deposits. One of the contributors, Herr Hjalmar Lundholm, a well-informed official at Kirunavara, calculated that in central Sweden there existed more than 137,000,000 tons, and reserves of 40,000,000 tons more, which had been incompletely investigated; whilst he credited Lapland with the gigantic total of 1,335,300,000 tons.

Having regard to the very high percentage of iron which the Swedish ores contain, the above figures represent about 845,000,000 tons of metal, 750,000,000 tons of which are in Lapland.

It is not known where iron-mining was first begun in Sweden. There are documents in existence which go to show that work of the kind was carried on at Norberg in the beginning of the fourteenth century. According to the statistics the average annual output rose from 235,000 tons in the period 1833–1840 to 6,728,036 tons for that of 1911–1914. For 1914 alone the output was 6,586,630 tons.

During the last century the mines of central

Sweden produced the largest quantity of ore; but the output of those of Lapland is now the more considerable.

With regard to the amounts of iron and phosphorus in the ores the official statistics from 1909 give details. From these it appears that in the years 1909–1914 over 73 per cent. of all of the first-class ore produced in Sweden contained between 60 and 70 per cent. of iron, whilst only 2·8 per cent. contained less than 50 per cent. of metal. Over 79 per cent. contained 0·1 per cent. of phosphorus, about 8 per cent. contained less than 0·01 per cent., and about 3 per cent. had less than 0·005 per cent.

The value of the iron ore produced in Sweden in 1914 was about 53,000,000 kroner, an average of 8·05 kroner per ton, or a rise of about 3 kroner per ton since 1904.

The number of labourers employed at the mines in 1914 was 10,572, of whom 3736 worked underground and 1869 on the surface.

The total quantity of iron ore exported from Sweden in 1913 amounted to 6,439,750 tons, which corresponds to 86·1 per cent. of the production of the whole country during that year. Germany was the largest purchaser; then came Britain, North America, Belgium, and France.

Until 1886 very little ore was despatched abroad; the amount for that year was only 19,288 tons. In 1887, however, the export from Grängesberg commenced; in 1892 Gellivara followed suit; and in 1901 the quantity of ore exported was 1,729,303 tons. When the new railway, 'The Rigsgränsbanen,' was completed, and the route from Kirunavara to the Ofoten Fjord, on the coast of Norway, became available, it rose at once by a million tons, in 1903 the quantity exported being 2,827,428 tons. Of the seven and a half million tons of iron ore produced in 1913, Germany took about four and a half million tons, and England 672,836 tons.

## THE FORESTER'S GIRL.

### CHAPTER VII.

DOWN the windings of a steep, rocky road, at one moment densely black between copses of stunted pine-trees, at another faintly illumined by the pale light of a first-quarter moon, a weary horse, with drooping head and shuffling hoofs, bore his equally weary rider the last mile or so of a long day's 'hike' through mountain wilds to his lonely little cabin near the grass-flats of Laughing Lake. Isolated and dreary as the small, unlighted house might have appeared to a stranger, the sight of the open spaces, of the roughly fenced corral with tranquil-flowing creek winding through spongy green meadows, of the few yards of soft level road,

and the plain clap-board walls behind which waited bed and blankets, was a welcome one to David Hardy as he dismounted stiffly from his sweating horse, and having quickly unbuckled the harsh cinches and removed the heavy saddle, slipped off the bridle and turned the animal loose inside the corral to refresh himself with a vigorous roll and shake before suppering on crushed barley.

His riding-gear being flung into a corner of an adjacent wood-shed, Hardy's next move, albeit dog-tired and hungry, was not to take from its hiding-place in a hollow log the key to his dwelling, but, with eager hands and

eyes bright with anticipation, to search a small, rough box, roofed with tin, and with door casually closed by a leaning stick, which, nailed to a stump by the roadside, served the purpose of letter-box for the forester of Laughing Lake.

Back and forth in the shallow recess now groped his dusty hands—'So damned dark,' he muttered; felt again in every crack and corner, along the rough edges of the stump, at the short grass at his feet. 'Humph!' grunted David. 'I reckon them fellows didn't come in after all. My word! but poor little Annie 'll be disappointed. No,' he muttered after another fruitless search in the box; 'ain't nothin' here;' and propping the door again, he unlocked the door and entered his silent house, warm and close after the heat of the day.

Another moment, and, lantern in hand, he was back at the letter-box, assuring himself that in the darkness it could not be but that he had overlooked the longed-for missive from his 'girl.' Yet what the flashing light of the lantern revealed to the seeker was not a letter, but something that caused him suddenly to knit his low brows into sharp, dark lines, while from his lips, hedged about with a three-days' growth of black beard, broke something between an ejaculation and an oath. For there, in the thick dust of the road and on the flat edges of the bordering turf, the forester's quick eye discovered the unmistakable trampling of horses' hoofs—of two—no, of three; for here, a few yards in the rear, were other hoof-prints and a pawing up of the dust where a third horse had grown restive with waiting while the other riders—Yes, of course—what a bally fool he was!—Nat and the others had been through; would have left his bread in the wood-shed, and Annie's letter with it.

Immensely relieved, empty stomach and tired body forgotten, Hardy darted to the wood-shed, where in the light of the lantern gleamed white a paper-wrapped parcel, from which emanated a ravishing smell of fresh-baked bread. Hastily tearing open the package, he sniffed at the generous golden loaves (for there was in 'Mamma' Axel's soul, however querulous at times might be her tongue, no streak of meanness), searched among the papers, lifted his lantern high above the neatly piled lengths of wood, lowered it to the ground the while his heavy boot-toe turned over the debris of bark and chips; then the eager look faded from the man's face, leaving it sallow and dour with fatigue and disappointment. Without a word, he carried the parcel of bread to the house, glancing once or twice behind him to see lest by merest chance something fluttered to the ground, and as he set it on the table caught sight of a few words scrawled in feeble pencil on the wrapping-paper: 'See you morning. Miss L. all O.K. Yours, N. D.' Instantly David's face cleared,

and giving vent to a boyish 'Hip-hip-hurrah!' he set to work without further delay to kindle a fire and prepare for his much-belated supper.

Soon a cheery crackle issued from the stove, the coffee-pot danced a jig on the red-hot lide, the while the forester gave his face and hands a badly needed wash, and ran a comb through the dense thatch of his black curls.

'Good Lord!' he exclaimed, grinning at himself in the small looking-glass and running a horny finger over his chin. 'If such a fierce-lookin' sight as I am wouldn't scare you, Annie darlin', you'd as lief as not put your dear little arms round the neck of a grizzly bear! Must get some of this buck-brush off my chin and somehow or another manage a hair-cut before I meet her,' he concluded, and forthwith attacked a great slice of ham and a huge cup of coffee, black and steaming.

As his tired body began to feel the benefit of the food, David's mind, likewise refreshed, reverted to the matter of the missing letter, which the relief of learning that Annie had safely reached her destination had for the time-being dismissed. Now, however, the question began to puzzle him as to why, if she were there, she had not written to him, inasmuch as no one could pass into or out of the mountains without a halt at the Grizzly Station for a meal or drink, or at least to call for the meagre, eagerly-longed-for post, to be distributed to the widely scattered ranchers and foresters on the trail to the Granite Mountains.

Accordingly his 'girl' could not have failed of an opportunity to send him a few lines, unless—and this, he quickly concluded, must have been the case—she had not arrived on the day expected, but been delayed by one of Charlie's not infrequent breakdowns with his heavily loaded wagon and overworked team. If so, Annie, he reasoned, would still have been sleeping when Nat and his companions passed through. Poor little girl, how tired and lonely she would be, and he not there to take her in his arms at the journey's end!

A big lump rose in his throat; he did hope she got his letter and would understand how impossible it was for him to neglect his sick fellow-forester or his duty to the Government. Well, thank goodness Niel was really better! It couldn't be more than another few days before he would be able to wait on himself, and then, David planned, even if he couldn't get all the way to the Grizzly, he would take his fresh horse and run down to the Kings' ranch, where Annie was to stay until he could spare a day to drive her to Keyes Mills to be married, and ask them to take their team and fetch her and her trunk along.

In the meantime, he reflected, the girl would be better cared for and perhaps find the life less rough and lonely at the station than she would do at the Kings'—kind-hearted people, but

tremendously busy with their summer dairy-work and a small house swarming with children.

As to the roughness, David paused in the refilling of his cup and glanced about the two-roomed cabin, scrupulously neat, from the frying-pan hanging on its special nail beside a well-cleaned saucepan, to the worn broom in the corner, and a shelf of books surmounted by a large, framed photograph of Anita, and, in another less gorgeous frame, his forester's certificate. This was the living-room; beyond, through a narrow door, could be seen the small, bare apartment where stood a chair and the forester's bed.

'There ain't no frills about *this* shack,' he mused, his thoughts unconsciously travelling back to the pretty little villa in the valley town, with its muslin curtains and stuffed furniture, where his school-teacher sweetheart boarded. But to a man like David Hardy, trained all his life to endure hardness, the absence of finery and furniture was something barely realised, and certainly not worth troubling about; neither one nor the other could make or mar his own and his Annie's happiness.

Very shortly, his simple supper-dishes carefully washed and set away (for it was part of the forester's creed never to 'put off till to-morrow'), the big key grated in the lock, and David, having long since, for Annie's sake, denied himself the comforting extravagance of tobacco, was ready to roll into the blankets for a well-earned rest.

On the morrow his first waking thought was of Nat Duncan's promised visit, and as Nat was the reputed jack-of-all-trades in those parts, it occurred to David, as his razor bravely mowed its way through the stubble on his chin, to ask him to relieve him of some of his Samson's growth of hair. Nor had he long to wait for the welcome pad-pad of a horse's hoofs in the soft road, followed by the roar of Nat's 'Hullo, there!' and his step on the door-sill.

After the usual exchange of news, local and general, David produced a pair of huge shears left behind by some goat-herd when taking his flock back to the valley, and having successfully approached Nathaniel *re* his services as barber, seated himself for the operation, at the same time remarking half-shyly, 'I suppose you'd hardly likely see Annie—Miss Lalonne, I mean—when you was at the Grizzly?'

'See her?' echoed the amateur barber. 'Well, I should rather say I *did*! By gosh, she's a winner, Dave! I congratulate you, my boy! Want it pretty short behind, don't you?' he queried, pausing in the raucous snip-snip of the shears.

'Yep,' answered David. 'Cut it as short as you like. I don't get hold of a hairdresser every day,' he added jovially. 'But say,' he went on, 'I don't understand. *When* did you fellows

see Miss Lalonne? She wasn't up, was she, when you went through?'

'Wasn't up? What the blazes you mean, Dave? I seen her in the mornin' when we was goin' out. Thought you knew she was comin' in the night before with Charlie's outfit. Man alive! keep your head still, or I'll be takin' the ears off you with these durned shears. Guess you've bin asleep all this time, Mister Hardy,' he chaffed; 'but you'd best wake up pretty peart, or that young English feller'll be waltzin' off with your gal! There now, you bally idiot, didn't I tell you to keep still? You've made me take a slice out of your neck! Here, lend me a wipe; 'tain't deep, but it's bleedin' some.'

The forester, without comment, handed Duncan a handkerchief, and the latter rattled on: 'He come along with Charlie same trip as your young lady; him and a doctor chap, both of 'em English—toffs, you know—come for the fishin' an' huntin', Charlie said. I reckon the tall feller, what baint the doctor, you understand, was mighty took up with your young woman. I seen him watchin' her out o' the tail o' his eye when she was jokin' me an' the chaps about your letter; bright as a new dime she looked, and *sassy*! You're in luck, Dave; but I guess you're not needin' my services to tell you *that*. Hoped I'd get another look at her yesterday, but she warn't nowhere 'round. Here! twist your cocoa-nut this way a bit more till I get a whack at these streamers. This ain't a job for a barber single-handed,' he jeered good-naturedly; but his victim made no reply. He was thinking hard.

Presently, 'What like is the doctor chap?' he asked with an assumption of casual interest.

'Didn't see him. He was off to Silver Creek both times we was through, seein' Mrs Burke's little cove. Broke his arm, Charlie was sayin'. Nope, I guess the doctor ain't in the runnin', Dave; it's t'other chap what needs watchin';' and Nat indulged in a loud guffaw.

The forester's face turned brick-red and his brows knit themselves angrily, but he managed to ask with well-concealed anxiety, 'Suppose you don't chance to have any letters for me lost in your pockets? I looked in the box last night, but thought maybe you'd forgotten 'em.'

'Nope, there wasn't none. Mrs Axel went to Miss Lalonne's room to see if she had anythin' to send, but the ladybird warn't at home. Guess she was on the wing, improvin' the shinin' hour with the English toff. The devil take you, David!' he broke off half-wrathfully. 'Have you got St Vitus' dance or creepin' paralysis that you can't sit still in a chair? I'd like as not have took the scalp off you. But I guess you'll do now,' he added, throwing down the shears and running his big hand over David's poll. 'Want to look at yourself? Thought I'd

leave some of your forelock, 'cause most gals *love curls*, they says.'

Poor David, by this time quite filled with jealous misery, could ill endure further his friend's barbed chaffing; so, without troubling to consult his modest looking-glass, he said, with as much heartiness as he could muster, 'Oh, that'll do fine, Nat. I'll give you a first-class certificate as sheep-shearer. What's the damage, Natty? It's took a lot o' your time.'

'Never mind the damage!' was the rejoinder. 'Just give me a quid. What! you don't chew nor smoke?' he exclaimed as David shook his shorn noddle. 'You aimin' for a short cut to heavenly mansions?' he joked. 'Well, then, it's me for a cigarroot,' he added, pulling out his small

cotton sack of 'Bull Durham,' and rolling the thin paper leaflet. 'I'll let you off this time, Dave; but don't you forget that when *my* turn comes an' the weddin'-bells is tunin' up, I shall drop down on you for some o' your hair for my best mattress. Haw-haw! That's a good un, bain't it, Dave? Well, so long, sonny; and mind you take along a six-shooter when you go to fetch your gal from the Grizzly. There bain't no flies on that foreigner; you may bet your sweet life on *that*.'

With which parting bit of philosophy, he caught up his horse's lines, swung his long leg over the saddle and speedily disappeared in a cloud of dust.

(Continued on page 122.)

## PER MARE, PER TERRAM, PER CÆLUM.

By IGNOTUS.

**T**HE recent recrudescence of submarine activity (signalled to most soldiers abroad by the loss of their mails), together with the free advertisement that many papers were good enough to accord the *Deutschland*, Germany's first effort at a 'peaceful' submarine, is very illuminating to those of us who follow the war with a view to detecting the undercurrents rather than the obvious.

Two facts suggest themselves—first, that the battle of Jutland has not altered the balance of sea-power in the slightest degree, despite all argument; second, that the policy of peaceful penetration can be pursued in war no less than in peace. Indeed, though our control of the seas has irritated Germany to the last hair, it must never be forgotten that it also seems to have galvanised her scientific and commercial ingenuity into fresh manifestations of activity.

This ingenuity was never more plainly brought home to me than by a story recently related by a naval officer, who was one of the actors in the little drama. His ship was on patrol, policing the weary waterways along which our sea-borne traffic, conscious of its safety, contentedly crawls, when a cry was raised from the look-out that a submarine had been sighted to starboard—that is, on the ship's right side.

It should be clearly understood here that *nighting* is everything, for, though the big ship, by reason of her bulk, presents a visible target to every submarine within eye-shot of her periscope, the converse does not hold good. When the submarine submerges, her speed diminishes by exactly the amount of exertion necessary to drag a body *through* the water instead of on the top, but she becomes absolutely invisible except for the periscope (the ship's eye), looking like a walking-stick, which stands from

two to three feet out of the water. This is the submarine's inherent defect, for no method has yet been devised, or seems likely to be, whereby she can travel without the periscope giving away her position when near the surface, by the small V-shaped wake it leaves astern, as it cuts quietly through the water. This wake is the only spoor submarine-hunters have to guide them, and it will readily be conceded that a trained and experienced eye is required to detect even so much. Let any doubter try!

There are various methods of dealing with these sea-wolves, but in this instance the captain of the patrol-ship determined to ram her, and altering course accordingly, he rang down to the engine-room for full speed, and went for his target. They were not far from it when the sharp eyes of one aboard missed the familiar little wake of the periscope, but detected instead a kind of bobbing, dancing motion, quite new to him, and, risking ridicule or a snubbing, reported the fact forthwith. Almost as it was reported, the trap was seen, and the skipper altered course once more, only just in time.

The Germans, with the most devilish ingenuity, had lashed a three-foot stick of wood on to a floating mine and sent it adrift in the evident hope that a patrol-ship would attempt to ram it, and go to glory. Their hopes were, however, frustrated in this instance by the mine being fired at and destroyed. The scheme was fiendish, but no one can withhold the tribute of ingenuity from the designer.

It is probably known to most people by this time that mines are laid not only by mine-laying ships, such as the *Königin Luise* that was sunk at the mouth of the Thames at the outbreak of war, but also by specially adapted submarines; in fact, these do all the work since the Kiel Canal has become such a popular

place of residence. To deal with this special type motor patrol-boats have been largely used, and one of the latter was specially told off some time ago to find, and seize or sink, a German *Unterzeeboot* that had 'sent up' four mine-sweeping trawlers within twenty-four hours. The scene was on the sea-coast not a hundred and fifty miles from London town, and dodging to and fro, the motor-boat eventually sighted her prey, which incontinently dived. The motor-boat doubled on her tracks, taking the precaution to station men meantime to port and starboard with bombs to fling at the submarine should she emerge sufficiently close, while the remainder of the hands were suitably disposed, to make things warm with rifles.

Up came the submarine some distance ahead, and off went the motor-boat like John Gilpin, and as she got nearer and preparations for a warm reception could be plainly seen, the *Unterzeeboot*, not liking the look of things, resubmerged. Nothing daunted, the patrol-boat hung about till the submarine made a third bow to the daylight, and, as luck would have it, as close to the patrol-boat as its delighted commander could wish. Hastily seizing his speaking-trumpet, he hailed her in a stentorian voice: 'Do you surrender? If not, I'll bomb you;' only to receive the following reply in excellent English, 'Why, you crimson-coloured fool, isn't that what I've been trying to do for the last three hours, and you won't let me?'

Expressed in tabloid form, this war has resolved itself long ago into traps and targets. With the former I have just dealt; hear, therefore, an amusing instance of the latter.

When my regiment was holding a certain line near Neuve Chapelle about two years ago, we had two companies up in the trenches and two others in support not very far back, disposed in farms and houses of various stages of disrepair, according to the amount of strafing they had undergone. The best way to our trenches was a road which, running past the support-billets, took a sharp, left-handed, dog's-leg turn straight past us into the German lines. When I say 'best' I do not mean safest, as Fritz used to shell the turn and the latter half of the dog's-leg in order to stimulate the circulation of our blood as we marched up on relief at night. Personally I never thought they did much damage, but one of the regiments in our brigade marked what they thought was the danger-area to be hurried over with two little red flags, thereby gaining for themselves the name of the 'Windy Gents.' But I am getting off the line.

Parallel with our billets, and on the other side of the turn, was a small hamlet that we had never occupied, but which the Germans vigorously shelled and damaged on odd days, in the

belief that troops were massing behind it for an attack—a belief that was quite wrong.

We had at this time a battery of 'heavies' in the division, commanded by a Highlander. Genial to a fault, absolutely without nerves, and radiating cheerfulness as he walked, he ate, drank, and slept 'targets' for his beloved guns, and was never so happy as when he had one in prospect. He used to come up to an old building behind our front line every day, and, lying flat on a heap of straw, scan the country for hours through his glasses to try to discover signs of the German gun emplacements.

One morning they knocked half the hamlet to pieces again, and incidentally exposed their hands to the watchful M.K., who, spotting at last where they were firing from, quickly put them out of action with his heavies, and so gave every one concerned a little peace.

It was there that I first made acquaintance with the 'fixed-rest' sniper, or it might have been a machine-gun. By a fixed rest I mean a rifle lying in a specially prepared holder and sighted on to a target. When a man behind the rifle is satisfied with his sighting, he clamps the screws of the fixed rest, and the rifle can then be loaded and fired by any duffer with a certainty of hitting the mark; indeed, he can't miss it.

At one of these billets a sniper used constantly to hit a particular brick in the wall, just about the height of a man's head. You might walk past it in the dark for an hour without the least danger; then suddenly he would begin, and a bullet would smack into the wall with a crack that made you jump. You *had* to pass this wall to get into the billet; consequently the only wise thing to do after dark was to bend low and skulk, in which case you were as safe as a house. My regiment was up there twice, and the last time the sniper had eaten his way three parts through the first brick, as testified to by the neat little layer of brick-dust lying on the stone-flagged path. Why he never caught any one I don't know, for men got awfully careless at last; and another strange thing was that by daylight you could lean against that spot and smoke a pipe with perfect safety. I suppose he was afraid of giving himself away. If that be the correct explanation, what devil of distortion or misapprehension possesses them that they describe themselves as cultured?—a claim that I am perfectly certain the lower orders put forward with absolute seriousness and belief in its accuracy, even if their rulers have their tongues in their cheeks! I recall a very striking instance of that fact.

I had been hit in a show, nothing serious, but was being sent down to the base, and as I could walk perfectly well, I strolled along the Ypres platform to the hospital train, while the overworked orderlies were entraining the stretcher cases. I was accompanied by the Belgian station-

master of Poperinghe, the next town to Ypres (all this, of course, was before Ypres was laid in ruins), and we came across a few German wounded, including one Landwehr sergeant, who, in a querulous voice, demanded to know why they were being left so long unattended, adding, as an afterthought that might quicken our movements, '*Die ganze Welt weiszt, dasz wir die gebildeten Leute der Welt sind*' ('The whole world knows we're the best-educated people in the world'). To my surprise, and before I could reply, the station-master had explained to the Hun in excellent German the system of collection. 'First the English, then the French, then the Belgians, then afterwards, if there's room, and nobody has anything better to do, the Germans.' As a matter of fact, it wasn't true, because no question of nationality entered into it; they were putting the worst cases in first, naturally, and leaving the easier ones to be lifted in afterwards; but it effectually silenced the Hun.

But what, in the name of Heaven, can one expect from a nation so eaten up with conceit that even lying wounded in enemy hands it will attempt to prate of its educational superiority?

One point of difference that will always set the German Tommy apart from the English one is his absolute lack of humour (I had almost written 'honour'). Who but Tommy would have thought of setting the drill-book to music? To illustrate my meaning, I should explain that some years ago an excellent but rather misguided society attempted, with the full approval of the powers that be, to teach Tommy to sing on the march. Tommy was quite willing to sing, but intended to sing what *he* liked, and not what the society put into his mouth, whereby the experiment came to an anæmic and unlamented end. However, to return.

There is a movement whereby a body of men in fours forms line, not in the least difficult to perform, but requiring that the men should remember their numbers on parade and keep their wits about them. The drill had been drummed into this particular regiment's head to such an extent that it became automatic, and eventually some barrack-room wag set it to music, and sang it to the air of 'Three Cheers for the Red, White, and Blue.' It ran thus:

At the 'alt, on the left form platoon—  
At the 'alt, on the left form platoon.  
If the hodd numbers don't mark time two paces,  
'Ow the 'ell (crescendo) can the rest form platoon?

I heard the Shropshire Light Infantry sing it, and a capital marching tune it made; but I don't know if they were the authors.

Thomas is a marvellous person for gadgets—that is, adapting things to purposes for which they were never intended.

Some time ago (I forget exactly when) a tooth-brush was issued to each man in the army, hygienic requirements having been satisfied for many years previously with the sybaritic provision of a comb, to which latterly a hair-brush became linked in holy matrimony. Never having used one previously, T. A. showed it in all its maiden purity at the weekly inspection of his kit, till ordered to take it into wear, which he promptly did—to polish his buttons. Again authority intervened, and Tommy, cheerfully complying, adapted it to its original purpose, and the long-suffering tooth-brush now cleans teeth and buttons with the utmost impartiality. Whether the medical faculty are satisfied with this division of labour I have yet to learn, but that profession itself is not altogether free from the charge of gadgets, if all one hears be true.

Not long ago a man in the — Rifles was blown up in France by the explosion of a mine, and, as the result of shock, became dumb, and was invalided home. Nerve cases of this sort are not rare in this war, and are very difficult to cure. Be that as it may, however, ordinary methods appear to have failed in this instance, till one day, while still in hospital, the patient required to have a tooth extracted. The surgeon in whose care the man was instructed the dentist not to use an anæsthetic, in the hope that the pain would restore speech, and he was not disappointed, for out with the tooth came a flood of language, beginning, 'Good Lord! you'll pull me [censored] 'ead off,' the rest of the pent-up flow of eloquence being very prudently omitted from the report. I think one might fairly accuse the doctor of trying a gadget, in this instance crowned with success; though, even so, I can find it in my heart to feel sorry for the victim.

Thomas loves a situation that gives his whimsical humour full play, and I remember a friend telling me of a delightful case that happened to him on one occasion when dining with a Highland regiment. Officers of these units invariably affirm that their men are Scotch, and so they may be in bulk; but at the risk of offending their susceptibilities I am bound to say it is not my experience, for I was attached to the Mounted Infantry company of a very celebrated Highland regiment during the Boer war, and though *most* of the men were Highlanders, quite a percentage were Englishmen, some few even being Cockneys. At the mess dinner pipers, as is customary, came in and played round the table, one of them, as a compliment, being stationed behind my friend's chair to finish the air. When he was finished, my friend turned sideways in his chair and courteously thanked the man, adding, in his pleasant way, 'I expect you come from the far north, don't you? I know Inverness myself.' Replied the piper with a rich southern brogue, 'I do not, yer anner; I

come from the County Cork,' an unexpected reply that set the table in a roar.

Nothing illustrates this humorous faculty better than a little side-play I witnessed recently. We had come in from the desert to one of the biggest cities of Egypt, and while we were marching up from the railway station to camp, the orderly-room sergeant (in whose hands are all the regimental papers and documents) passed us in an open fly, shepherding the boxes of papers for which he was responsible. Whether he knew it or not, the biggest crate bore a label, 'Lemonade only,' and a rumour, quite without foundation, flew down the battalion like a priority telegram to the effect that the orderly-room sergeant had been seen bolting with the sergeants' mess stores!

I wish our politicians could realise what a shrewd and well-informed critic T. A. is of public affairs. It might well give them pause. The other evening I was sitting alone in my mess, reading, and overheard some of the servants outside talking. One in particular was holding forth. He had been in the Dardanelles landing on that historic 25th April, and through all the subsequent horrors, and his account differed in no degree from a dozen others, except that he was rather inclined to blow his own trumpet—a very unusual feature in the regular Tommy—and for a remark he made in conclusion, 'And we might 'a saved the 'ole lot if it 'adn't 'a bin for our goin' and givin' a rap at the door, and comin' away, just for to warn 'em as we was goin' to call ag'in,' referring to our unsupported abortive naval attack when the Red Marines swarmed all over ground on which we were never after able to get a footing. For a concise summing up, that seems to me to leave nothing unsaid, and I could have wished Winston Churchill to hear him.

It was very interesting to watch Lloyd George in his former rôle of War Minister, and to read his speech on 'prematures'—that is, shells that burst either in, or on leaving, the gun; at any rate, before they got to the Germans. Reading it, I recalled a ghastly affair in my brigade at the Rue d'Epinette. In the early trench warfare period, when we were not doing very much, the gunners one day took it into their heads to put a few shells across on to the German line. We had two companies of a rifle regiment just on my left, and about 1 p.m. the captain and two subalterns assembled in the captain's dug-out for lunch, when a premature landed bang on the dug-out, killing the captain and one of the boys, and severely wounding the other. Such things shake one's nerve.

First cousin to the premature is the 'short'—that is, a range is underestimated by the gunners, and a shell detonates on *our* front line instead of the Germans'. Nowadays such a thing is impossible, because a forward observing officer from the artillery is in the infantry

trenches, and telephones back the result of every shot to the battery, but in 1914 we had not arrived at these refinements.

Of course, one realises that where the difference between safety and shambles is only a question of one to two hundred yards, mistakes *must* occur; but they are very unsettling. I remember, at the beginning of what was afterwards the first battle of Ypres in October 1914, we had advanced over some three miles of country towards Becelaere on the Roulers road, and not being able to push on, dug ourselves in at dusk. The night was occupied in alarms and excursions—alarms because the Germans fired wild bursts which we thought portended an advance, and excursions to try to get up some rations from the rear. Towards dawn the fire slackened greatly, and a young gunner subaltern came up from the rear to ask if we could show him any targets. We showed him where we wanted the Germans gingered, and added, 'Pitch 'em well up, too, because we simply *hate* getting them in the small of the back ourselves.' He promised, and departed; nevertheless, when he began shelling, one of the shells dropped on my trench and wounded a man. I got behind a house that was my headquarters, and semaphored a message through that the guns were short and had wounded one of my men, yet before it could arrive (far less be acted upon) they fired again and wounded another. Again I got under the lee of the house, where, secure from German view, I semaphored a still more urgent message. Again they fired and wounded a poor chap in the brain, who was brought into the house, and died shortly afterwards. For the third time I semaphored back, stating that if they couldn't pitch them up they had better stop, or we couldn't, for flesh and blood wouldn't stand it; and eventually this message got through, and they lengthened, but we felt very jumpy for some time when we heard one coming.

Nothing has surprised me more in this war than our airmen's exploits. For one thing, I never thought we took the job sufficiently seriously; and for another, I thought that in anything demanding scientific knowledge we were bound to run second to Germany. I reckoned evidently without the sporting spirit necessary to achieve success, a quality in which Germany is so conspicuously wanting. It is, therefore, with the more pleasure I confess my mistake and relate the following episode.

Some considerable time ago, four airmen were detailed to attack the railway junction at X., in enemy country. Each of them had his load of bombs, and starting at short intervals, they were to bomb the station and return. A dropped his bombs well on his target, but in doing so either got his machine hit, or engine trouble developed, I am not sure which. As a result, he had to descend miles away in enemy country,

where he at once found the trouble to be insuperable. Nothing daunted, he at once formed the desperate resolution to set fire to his machine, so that it could not be repaired, and to make his way back across that part of Europe on foot. This *reads* like a fairy tale, but is nothing of the sort, and carrying his resolution into effect without delay, he fared forth.

B. dropped his bombs, and, by a miracle, caught a glimpse of the flames from the burning machine on his way back, and at once descended for further investigation, noticing as he did so a knot of simple peasantry, with pitchforks, guns, and other joyous aids to agriculture, hurrying up to take a hand in the game. As B. dropped lower A. saw him and divined his intention, and set to work waving his handkerchief to attract attention. B. immediately realised the situation and came to the ground, risking capture in order to pick up A. All the machines for this trip, I might add, were single-seaters, built for one man only, and it was very much a question whether they would bear the weight of two; added to which, there was no room for the second man—

a mere trifle, of course. A. ran alongside and scrambled in somehow, trying not to stop the machine, and stowed himself in a knot on the floor with his face to the tail of the machine, and his legs (apparently) round his neck. At this point the engine stopped. B. jumped out and by desperate exertions started it off again just as the merry husbandmen arrived; and, incredible though it seems, the machine did its one hundred and sixty miles home, where they arrived with A. so numbed that he had to be lifted out, and then fell down.

The other two airmen returned safely, having seen nothing of the burning machine. Such a story makes one proud of being an Englishman.

In conclusion, let me relate the story of an enemy flying raid. They came over (either Turks or Germans) on a recent moonlit night, dropped nine bombs, and fled. What they wanted was our aerodrome; what they actually got, though I am sure they would not believe me, even on oath, was three donkeys, two killed and one wounded.

## THE PREVENTION OF CANCER.

By ROBERT BELL, M.D., F.R.F.P.S.

AT this terrible crisis in our nation's history, when it is our imperative duty to conserve as many lives as possible, and while so many are being so ruthlessly destroyed in defence of our national honour, freedom—yea, our very existence—it may be excusable in me to call attention to an enemy in our midst which, if we do not mend our ways, will speedily exact more toll of life than this terrible war has done or will do. Its overthrow is, therefore, of equal importance with even that of the unscrupulous Hun. Moreover, I am positive that this can be accomplished without the sacrifice of a single life in making the attempt.

My plan consists in discarding the *laissez-faire* which at present is so characteristic of our mode of life, and in its place bringing to bear a little common-sense upon pernicious habits which have been in existence so long that they would appear to have become a very part of our lives, but which all the while have so materially tended to shorten them.

I refer to disease, and especially to cancer, which I maintain is an easily preventible malady, and yet one which has been making such rapid strides in recent years, and which, I venture to predict, will continue to increase in virulence if we do not call a halt in many of those ways in which we have been so complacently travelling, and which can only end in disaster.

It has been said, and probably truly, that 'Man is born unto trouble as the sparks fly

upward,' but most assuredly he is not born unto disease, which is of his own cultivation; and this statement I make advisedly.

It is not, however, my intention to adduce proofs of the truth of this assertion at present, though it would not be difficult to do so. My intention is to show that cancer is a preventible disease—in other words, that it is a self-inflicted disease, and therefore it depends entirely upon the mode of life which the individual chooses to live whether he has cancer or not. Evil habits must be subjugated by common-sense, and the stomach and digestion and excretory organs be considered in preference to the palate, which is the great culprit in tempting one away from the arcadia of health, and surreptitiously piloting one to the pitfalls of disease. Disease is no more an inevitable part of man's life than crime. The only difference is that the former is due to a contravention of nature's laws, the penalty of which is disease in its various forms, whereas the latter is the term applied to the breaking of man's laws, and they are both respectively penalised according to the gravity of the offence.

It is an appalling fact that during the past forty-five years the death-rate from cancer has risen close upon 300 per cent., until the annual mortality in this country alone has reached the enormous total of thirty thousand; while, if we take the habitable globe into account, there are at present living upon the earth twenty-five million persons who are destined to die of this scourge, if

we do not bestir ourselves and take measures to nullify the causes which lead up to its incidence.

These statistics, which I vouch for as being absolutely correct, surely do not go to demonstrate that operation for cancer has proved of any avail in saving life. On the contrary, I am absolutely certain, and have ample proof to substantiate this, that operations are largely responsible for this terrible state of affairs. My reason for making this sweeping statement is that I know, and every surgeon knows, that in no single instance has cancer ever been cured by the knife. I had seventeen years' experience of treatment by this means, being under the impression during these years that cancer was a local and not a blood disease, as I know now that it is. The result was that I succeeded only in aggravating the suffering and shortening the life of the patient; and on inquiries directed to those who had much more experience than I at that time had on the subject, I was met with the reply that in no instance, in their experience, had cancer ever been cured by operation. Of course, I admit, and have had many instances in my own practice, that tumours in various parts of the body have been removed without any recurrence taking place, but these were not cancer; though I have frequently seen cancer assert itself in the site of such operations which otherwise would never have manifested its presence. But the provoking part of the business is that every one of these tumours could have been dissipated by therapeutic and hygienic measures, and that without the least risk to the patient's life or health.

It is a notable circumstance that forty-five years ago the importation of chilled meat into this country was five pounds per head of the population, whereas now it is over sixty pounds per head; and when we consider that the flesh of animals is produced entirely from vegetable matter, and weight for weight contains no more food units than whole-meal bread contains, how on these grounds alone can we look upon it as an essential article of diet? Moreover, when we consider that the natural salts contained in wheat are essential to the health of the blood, and these are entirely absent in flesh meat, does it not appeal to one that the former is preferable as an article of diet to the latter? Furthermore, when we realise the fact that our digestive organs are so constructed as to indicate that the natural food of man should only be derived from the vegetable kingdom, every edible member of which supplies these essential salts in abundance, salts which by the usual methods of cooking are washed down the sink, we can readily understand how important it is that our foods, as far as possible, should be partaken of in their natural condition. If, however, they are subjected to cooking, it is essential that this be accomplished in a manner which permits of their not being deprived of these important salts. Again, it must be borne in

mind that the act of cooking deprives the article so treated of two-thirds of its nutritive value.

Then it must be remembered that man is the only member of the animal kingdom that destroys its food value by cooking. There is, however, another point worthy of notice in reference to the effect of diet upon health which is of supreme importance—namely, that the decomposition which results from a flesh diet is of a most offensive character; hence the alimentary canal of the carnivora is only about one-third the length of that of herbivorous animals, in which class man is included. Now flesh food is of a constipating nature; consequently there is a tendency in those who indulge in a flesh diet for the débris of this to be retained for an undue length of time in the colon, during which period the fluid contents of this decomposing mass tend to be absorbed into the blood, there causing the development of auto-toxæmia, which means that the blood becomes charged with ammoniacal products in place of the normal salts I have referred to, and these act most deleteriously upon cell life, and render the cells prone to take on an unhealthy form of existence, which may degenerate into malignancy, and thus cancer be the outcome. I am daily in contact with cancer patients, and I have never seen a case of cancer in a person who lived on the fruits of the earth, where these were eaten in their natural condition or cooked in such a manner as to preserve their natural salts. As to lower animals being subject to cancer, it has been ascertained that it is only when they come under the domination of man that this is so; their natural diet and environment being changed for the worse, they become subject to cancer and other diseases which are quite foreign to them in their wild life.

In short, my experience has compelled me to arrive at the conclusion that cancer is entirely due to the ascendancy of these ammoniacal products over the natural vegetable salts in the blood-stream. This being the case, as I am convinced it is, it is not difficult to recognise how readily cancer may be blotted out of existence; also rheumatism and gout, which are closely allied to cancer in their natural history.

Permit me to put the following question. Is it no mere coincidence, but a case of cause and effect—in fact, is the increase of the mortality from cancer largely, if not altogether, due to over-indulgence in the consumption of one article, which, instead of being normal food, only takes the place of a stimulant, and, in the long-run, acts as a slow poison? This may appear to many to be an extraordinary question to put, but I have no hesitation in replying that 'The answer is in the affirmative.'

The importance of grappling with this fell disease is emphasised by the announcement that a sum of money, estimated at about a quarter

of a million, has been left to Edinburgh, in reversion, by the late Mr George Fisher Melville, with a view to combating the disease of cancer. The money, when it becomes available, is to be used for the care and cure of cancer, which may mean the founding either of a school of research or a hospital.

In conclusion, may I suggest to the readers of the above notes that they give my dietary a fair trial? After which, I feel assured, they will

derive so much benefit from it that they will not readily revert to the conventional mode of dieting.

If I might, without ostentation, put myself forward as an example of the benefits derived from it, I may, without any attempt at boasting, but with an expression of thankfulness, state that at the age of seventy-three I am as fit to-day for work, both physically and mentally, as I was thirty years ago.

## THE CATERPILLARS.

By C. F. TOWNSEND.

'**ROTTEN!**' said Gardner, gazing gloomily at the fire in the club smoking-room.

It was the first I had seen of him for over a year since he had gone out to France as a lieutenant in the Motor Transport, and now he was home on leave and his name was not Gardner; but that does not matter. The exclamation was in reply to my question as to how he was getting on at the front.

'A few months ago, if I could possibly have chucked it up I would have done so, but things are moving now, or will do before long. What you fellows at home don't understand is that the worst thing about the war is the infernal waiting for month after month with nothing whatever to do. You come out for active service, and when you get there you wait, and wait, and wait, until you wish you were dead. We did have one little excitement in about a twelvemonth, but that was all.'

'What was that?' I queried.

'Well, it is so long ago that there is no harm in telling you. As I was saying, it had been deadly dull on our bit of the front ever since the Somme business had opened—I was farther north, you know—and we were all getting absolutely fed up with having nothing to do. The Motor Transport headquarters was like a Government office, where we played from ten to four, with two hours for lunch, and I do not know who were the more weary of it, the officers or the men. There were always odd repairing jobs going on, just to keep us from being absolutely idle, but that was all. The Boches were as quiet as mice, and I really believe that you might have stood on the parapet of the front trench and admired the view without having a shot fired at you, for Fritz seemed to have received orders not to make trouble. As for a German aeroplane, we did not see one for weeks at a time. The fact was that all the big guns on both sides had gone down to the Somme, and without big guns in trench warfare there is nothing doing. What few we had got we banged off now and then just to show the Germans that we had got them; but they hardly ever replied. I think they were worse off than we were.'

'One morning, however, as I was strolling into the one-time barn, which served as our repairing-shop, an orderly handed me a "chit," in which I was instructed to take six lorries down to the railway station at the rear. There I should find two large naval guns, with their crews and ammunition, waiting; *item*, two caterpillar tractors to draw the said guns. I was to bring the guns to a certain spot not far from Divisional H.Q., and leave them there with all the rest of the set-out.

'Just as I had finished reading it, up comes Farquhar of the H.Q. staff, and says, "Hallo, Gardner! the general has sent me to hurry you up. He is awfully anxious about those guns. They are on their way to the Somme, and he has only got the loan of them for two days. They must be back on rail to-morrow night. Our airmen tell us that there is great activity at the junction at —, behind the German lines. None of the guns that we have left will touch it; but these boys will. We have got the emplacements all ready for them. Whatever you do, don't bring them beyond —" (the spot mentioned in the "chit"), "for it would spoil the whole show if the Boches were to spot them."

'I lost no time in getting the lorries, and was at the railway under the hour. Here I found the guns and crews and ammunition waiting; also the two caterpillars. I soon got the naval men and the ammunition into the lorries, and then hitched both caterpillars on to one of the guns, which was also on caterpillar wheels. I had never seen these caterpillars before, and when we started they gave me a fright. Of all the fearful noises, these things made about the worst. They rattled and snorted so that you could have heard them for miles, and I quite understood why I was ordered not to bring them beyond —. There had been no rain for a week, and the roads were in good condition, so we went along in fine style, although the caterpillars would have got along all right even if the roads had been bad. I got to my destination without any mishap, and then took the caterpillars back for the other

gun, which presented no more trouble than the first.

'As soon as it grew dark the guns were dragged over the hard ground—it was a clear, frosty night—by men and horses, over the hill, down the other side, and nearly to the top of the next rise, on the other side of which were the trenches, and got on to their emplacements almost without a hitch, and nicely *camouflaged*. It was rather dangerously close to Fritz, but it was a question whether the guns would reach their objective if they had been three or four miles back, where they ought to have been for safety, and the general took the risk.

'The next morning that railway junction was completely smashed up. Our airmen reported that we had hit two trains full of troops, and had reduced the whole station and all the rolling-stock lying there to matchwood. And the guns only fired six or eight rounds between them. The Germans were taken completely by surprise, and it was a long time before their guns started to reply. But by that time it was all over.

'So far, so good; but about the middle of the day it began to rain, and it rained, and it rained, and still it rained. By nightfall everything was a mass of mud. I had had orders to be ready with the caterpillars as soon as it was dark, at the point where the guns had been left originally. There I waited expectantly in the pouring rain beside the caterpillars. One hour, two hours, three hours went by, but no guns appeared.

'Presently I saw two misty figures coming down the road, and heard my name called out. It was Farquhar speaking. "Is that you, Gardner? Are your caterpillars ready? We're

in a nice fix. We hadn't got one of those infernal guns half-a-dozen yards off the concrete when it stuck fast in the mud, and an earthquake won't make it budge an inch. We shall have to take the caterpillars right up. Wait a bit before you start. Blenkinsop is on the phone with the general, and we are going to give Fritz something to think about and try to distract his attention, so that he won't twig what we are doing. If he hears those blessed caterpillars it will be all up with our 'posh' guns. As soon as you hear the racket begin, go ahead as fast as you can. I know the ground well, and I am to stop with you and guide you. Curse this rain! If it hadn't been for that we should have got on all right. Now, if these engines won't do the trick we shall be nicely snookered. Those guns must be on rail by the morning."

'We waited for about half-an-hour, and there was hardly a sound. Then all of a sudden hell was let loose. Every gun, every howitzer, every trench-mortar, everything that would go off started. And they fired for all they were worth. The Germans must have thought we were preparing a grand offensive. The noise was deafening, and through the infernal din we moved the caterpillars up. Even their snorts were lost in the general pandemonium. At last we reached the guns, and hooked both engines on to one of them. Thank Heaven! it moved; and slowly, almost inch by inch, we dragged it through the mud and over the hill on to the comparatively hard road. Then we went back for the other. Directly we got over the hill the pandemonium stopped as suddenly as it had begun, and before daylight we had dragged those guns to the railway, and the general had kept his word.'

## THE WHITE HORSE BOOM.

By J. L. HORNIBROOK.

ONE of the most remarkable episodes in the history of Australian gold-mining, and one which had a strange and tragic ending, was that which was known as the White Horse Boom. It was all the more remarkable because it was brought about by a youth of twenty, James Coyle by name, who jumped into fame as the Boy Speculator.

The meteoric career of this youth, before he vanished mysteriously from the scene, was truly astonishing. At seventeen he was a junior reporter on an evening journal in Melbourne. It was at the time when speculation in gold-mines was at its height; when shopkeepers, farmers, and even artisans hazarded their hard-earned savings in the hope of waking up one morning to find themselves rich. Coyle may have been bitten by the craze, or else—being an enterprising and long-headed youth—

he may have found newspaper work too slow for him. At any rate, he forsook his journal and plunged into the vortex of speculation at Ballarat.

From the first his success was remarkable. He appeared to have the Midas touch. Every mine into which he put money yielded him large profits. The Boy Speculator quickly became a prominent figure on the Exchange at Ballarat, and even experienced brokers watched to follow his lead. Before he was twenty he had amassed a fortune bordering on twenty thousand pounds.

The mine known as the White Horse had been worked unsuccessfully for years. It was one of those unlucky ventures in which nobody had the slightest faith. The shares had dropped almost to zero, for the meagre yield was barely sufficient to pay working expenses.

When, therefore, it became known that Coyle was buying these, apparently worthless shares, it caused a flutter of excitement in Ballarat. He knew something—that was evident. It was rumoured that he was on friendly terms with the underground manager of the White Horse, one Zadok Raymond; and the conclusion arrived at was that the latter had furnished him with secret information. It was sufficient, however, that Coyle—whose judgment never seemed at fault—was buying the shares, and buying heavily. There was a rush to secure them before they rose too high. The Exchange was besieged by an eager, excited crowd, drawn from almost every walk in life. The rich trader rubbed shoulders with the artisan in his working-clothes, the shopkeeper with the clerk who had saved a few pounds.

The shares went up literally by leaps and bounds. The first day they jumped from a few shillings to one pound, then to thirty shillings, then to two pounds. The market closed at that price. There were buyers in abundance at two pounds or over, but no sellers. The brokers were nonplussed. They had held off at first, not knowing what to think, and vainly seeking information in every direction. Coyle, when appealed to, preserved a Sphinx-like attitude. There was an enigmatical smile on his boyish face. Telegrams were despatched to the mine, begging for information; mounted messengers posted away in hot haste to make inquiries on the spot. No information was forthcoming, however. Those in charge of the mine declared there were no grounds, so far as they were aware, for the excitement. No lode had been struck, no fresh discoveries made. They expressed surprise at the phenomenal rise in the price of the shares, for which they professed themselves wholly unable to account.

In spite of these damping reports, however, the shares continued to mount in price. The brokers could no longer stand out. They were drawn into the speculation, with the result that in one week White Horse shares rose to seventeen pounds.

Then came a startling, though welcome, surprise. News reached Ballarat that a reef of gold-bearing ore had been struck in one of the old side-shafts of the mine—a shaft long abandoned as hopeless. It was impossible to gauge the extent of the reef, but the sample of the ore sent to Ballarat showed gold in plenty. Another wild rush for White Horse shares followed. Up, up went the price, until it touched thirty pounds per share. Nor did it stop at that figure. People appeared to have lost their heads in a mad desire to grow rich. While the boom lasted, the shares were quoted as high as sixty pounds.

It was at this juncture, as was afterwards ascertained, that Coyle began to unload his shares. He did so in a very cautious and

secret manner, through certain agents in his employ, he himself still professing unshaken faith in the mine. The market was easier for a time; but fresh speculators were not wanting, and the shares maintained a high level all through.

Then came the crash. The reef had given out. It proved to be a solitary vein of limited extent, and search revealed no further gold-bearing ore in the vicinity. Down tumbled White Horse shares. In an incredibly short space of time they could have been bought for sixty shillings instead of sixty pounds. They fell lower still, for it was sadly apparent that the mine was now as worthless as it had been before the boom. Hundreds were ruined, some lost every penny of their life-savings; in one or two cases despair drove the unfortunate speculator to suicide.

Coyle had vanished. It was ascertained that he had left the country secretly, having previously realised his shares in all his mining ventures, and carrying away a large fortune with him. This alone was suspicious; but when it was found that Raymond, the underground manager of the White Horse mine, had disappeared also, there was little room for doubt that they had worked a clever swindle of some description between them.

Inquiries were set on foot, and resulted in a surprising fact being brought to light. It appeared that some six months prior to the boom Coyle had entered into negotiations with a New Zealand broker, from whom he had purchased twenty thousand pounds' worth of gold-bearing ore. Investigations at the mine itself led to a still more astounding discovery. In a disused shed, covered up with lumber, a trap-door was found. Underneath, leading down to the abandoned side-shaft, was a secret passage. The conclusion was obvious. Coyle, with the aid of his friend Raymond, had constructed the reef himself! It was for that purpose, beyond doubt, he had purchased the ore from the New Zealand broker. It must have been conveyed secretly to the mine and stored away until required, probably in the disused shed. Raymond was in a position to see to that, and also to prevent any premature discovery. Then the two confederates had carried the ore down through the passage they had constructed, and built up the supposed reef.

Coyle and Raymond had taken to flight after their daring fraud. Every attempt to trace one or the other failed. Rewards were offered for their capture, but without result. Yet the affair, as already stated, had a curious and tragic sequel, which took place years afterwards in a far-off land.

It happened that a mining engineer named Sedgwick, who had been at Ballarat during the White Horse boom, was travelling in a remote

part of Brazil. His journey brought him to a small town, where he heard much talk of a wealthy stranger—supposed to be an Englishman—who had built himself a magnificent abode in the neighbourhood. The house, which was described as resembling a palace, crowned an eminence, while the slopes were laid out in terraces or planted with shady orange-groves; and there, in solitary splendour, but surrounded by a staff of native servants, lived the wealthy and eccentric Englishman. He was known to be eccentric, because he made it a practice to close every entrance to the house after dark, and rarely set foot outside his own beautiful grounds.

Sedgwick's curiosity was aroused. He determined to visit this mysterious Englishman. It was with some difficulty he was admitted to the grounds; and, as he climbed from terrace to terrace toward the white mansion on top, he could not help reflecting on the wonders that wealth can accomplish. It had transformed this hill from its native wilderness into something approaching fairyland.

He had almost reached the house itself, when, in stepping on to a broad, sunlit terrace, he came face to face with—James Coyle. He described him afterwards as looking almost as boyish as ever; but there appeared to be a curious restlessness and watchfulness in his eyes, as though he had to be perpetually on his guard. Sedgwick had not the least doubt of his identity. He was so convinced that this was the erstwhile Boy Speculator that the reception he met with took him by surprise.

'Well, Mr Coyle,' he said, 'just fancy coming across you here! It brings one back to the old days in Ballarat.'

The other stared at him in a cold and repellent fashion. Whether the attitude was assumed or not, there was no trace of recognition in his eyes. 'You mistake, sir,' he said in a haughty tone. 'My name is not Coyle, and I know nothing of Ballarat.' He turned away and walked straight into the house, never once looking round, until the door had closed upon him. Sedgwick was compelled to accept the rebuff, and turn back. He rode away, wondering if by any chance he could have been mistaken. From inquiries he made in the town, it seemed that the stranger was not known by the name of Coyle; but that counted for little, as it was only to be expected he would seek to cloak his identity by assuming a different name.

If any doubt remained in Sedgwick's mind, however, it was set at rest in a tragic manner. While he was still detained in the little town, a native servant from the mansion on the hill rode in one evening in breathless haste. He had a startling story to tell. Less than an hour before his master had been found lying in one of the beautiful orange-groves, shot through the back. There was no doctor in the little town,

and Sedgwick volunteered to accompany the man to the house and render what aid he could. On his arrival he found the boyish-looking owner stretched on a couch in the magnificent vestibule. He was breathing with difficulty, for he had been shot through the lungs, and it was evident his end was near. He only lasted a few minutes, indeed; but before he expired he managed to gasp out these disjointed words: 'Zadok—shot—revenge—forgive.'

To Sedgwick, and to those in Ballarat who subsequently heard the story, the tragic affair needed no further elucidation. They recalled the fact that Raymond's Christian name was Zadok—a name so uncommon as alone to reveal the identity of the assailant. It was plain that Coyle had not kept faith with his partner in the White Horse fraud. He had fled with the entire plunder, leaving the other to fare as best he might. Raymond had pursued him for years, seeking revenge, until at last he ran him down in his beautiful retreat in Brazil.

Zadok Raymond, it may be stated in conclusion, was never traced.

#### THE PRIEST'S GRAVE, ST MAWGAN.

By OSWALD H. HARDY.

'BROTHER AUGUSTINE' and an old-time scrawl  
Of date and 'Jesu Mercy' on a stone;  
A thrush is singing from the convent wall;  
Thy grave, the bird, and I are here alone.

That rough-hewn cross, seared with the scars of  
time,  
Was old long centuries before thy day.  
It linked thy hermit musings with the prime  
When wandering saints stopped here their  
northern sway.

Fresh from the Cross, those early Fathers bore  
Its message to the lands beyond the sea,  
And here, implanted near the Atlantic roar,  
Left this mute image of its sanctity.

What was thy life?—thy round of daily dole,  
Of daily masses and monastic bread?  
What eased the hunger of the living soul,  
From what high source was thy best nature fed?

What was thy solace as the hours went by,  
And men, thy fellows, fought the world and sin?  
Were all thy thoughts bent on thy breviary—  
Sole mirror that to view thy failings in?

No, more than these, the breath of whispering pine  
Told thee of secrets hid from worldly eyes;  
The flowers that clustered round this hoary shrine  
Were decked for thee with life's infinities.

Thy lonely life rebukes our daily coil  
The ill-wrought web our restless lands entwine.  
Could we but spurn the joys that lure and foil,  
And pass our days as near the Cross as thine!

## SEVENTH SERIES

### THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

A CONSEQUENCE of the war, as lately we had occasion to remark, is our attainment of a certain comprehension of the million. The gathering of men and the spending of pounds in the largest quantities available—or unavailable, as it has sometimes seemed—have trained us to some sort of understanding and realisation of the units, or at least the hundreds and the thousands, that go to make the million. It is not only our new familiarity with this colossus, as a sum or a number in regular use for the most practical purposes, that has brought us to this comprehension—or contempt, perhaps, such as comes with familiarity—in the same way that all our thoughts and our imaginations have been widened in three years of the most impressive demonstration that life and possibility are not so narrow as had been unthinkingly assumed; there is also the evidence presented to us unceasingly that the million has become small in comparison with its former self, and that the eminent milliard, from being a luxury, has become, with Governments at all events, a necessity for common reckonings. Upon these obscure nights we look so often with new thoughts and questions, and sometimes apprehensions, to the starlit skies, wondering, it may be, if among those twinklings also there are wars, and if the terrible testing of fitness for survival progresses there as on poor, struggling Earth. We may wonder, now that humans have definitely left the surface in their enterprises and soar upwards, if ever, at some far reach of time, there shall be contests between these sparkling entities; and then we may recall what a learned astronomer lately informed us, that there are, it is believed, between one and two milliards—in other words, from one to two thousand millions—of stars in the full expanse of the skies. These stars, better perhaps than anything else we see and try to understand, convey to us a vague apprehension of infinity and an omnipotence beyond. On the deck of his ship in the waters of Egypt one night Napoleon, who also had his apprehensions, joined a group of his officers who were conversing as materialists and worldlings, and observing, 'Tell me, gentlemen, who made all these?' pointed upwards to the heavenly lights. Even in the matter of quantities they, as nothing else,

so it seems to-day, present obstacles to our new comprehension. The astronomer tells us that two faint patches of light which are to be seen in the southern hemisphere, called the Magellanic clouds, contain a group of twenty-five stars, which are six hundred times more luminous than the sun; and the experts have calculated that they are so many miles away from the earth as is to be suggested only by the figures 186 with fifteen round ciphers following (186,000,000,000,000,000), which is really 186 thousand million million, or, as it may be better put, 186 million milliards. That is a long way. But, in considering it too far for thought, let us reflect that not so long ago a traveller who dared the Atlantic from Liverpool to New York seemed to have approached the boundaries of earth; yet now this New York is, as one fancies, sitting at our very table, and the whole world is shrunk, and has been completely gathered into one bloody scheme of war like a game upon a board. We have come to realise that the world in various ways is too small for an undisciplined and much-multiplied man, who unfortunately, and to his own undoing, has been entrusted with a number of wonderful and beautiful secrets of Nature, and has merely maddened himself by misuse of the materials with which he might have achieved an extent of glory and happiness which to our poor minds is hardly more comprehensible than is the distance of those Magellanic clouds. It is shown that even if the war were now to end, this country of ours would be left with nearly two hundred millions of pounds to find every year for interest on the new national debt incurred in the struggle. Once a year. Looking upon the little children for whom we say we fight these wars, one may turn to wonder what could have been done for the training and welfare of our little Britons with two hundred millions every year. What a race might have been made of them! How much of the millennium, as one might fancifully put it, might not have been bought and paid for on their behalf with the money exploded in these three years of war expenditure! Some remember how in the past but two or three timid little millions were often grudged for such a purpose. Necessity, necessity—yes, it is necessity; yet necessity with a 'but' to follow. The lights in

the firmament of night were surely hung there for a suggestion to emerging man—and long before him—very long. Perhaps they will continue there for a million years, and what will the men of earth be like then, and the beings of other planets, or the anythings, as we can only vaguely suggest the possibilities of evolution? How for that struggle of the survival of the fittest? In what form will it be still continued? To what strange shape will humanity have developed? What will have become of its mind and body, misused as they had been? How many separate ages, like the ice age, will have been lived through? Will humanity be erased, as having been a failure, and creation of living form be begun again from the mass of germinating matter? Perhaps such changes, and more, might be effected in a million years, or, if that were not enough, then a milliard. The grand creation, in its long development, you see, can wait, as poor, wayward man, it seems, can not. There is infinity at the disposal of time.

\* \* \*

Thinking men have found it serviceable in these days, when careless minds are sometimes tempted to move towards an utter abandonment and materialism, to look at the starlit sky at night and meditate upon the limitless. The war is a thing of enormous importance, to ourselves, to our children, to posterity, and to the future of civilisation, as we put it. Yet in too many of the pompous considerations of these times does it not seem to be subconsciously assumed that not merely the twentieth century and the world, but the fate of infinity and the universe, are enwrapped in this struggle? Is it not a further pretty axiom that man in his present form, in some respects if not all, is an ultimate? Never was egoism more naïve than in this assumption. Man with his diseases, his habits, his errors, his selfishness, insincerity, and materialism, and his remarkable wars—behold him for an ultimate achievement! Regard the stars, consider in bowed humility a Creator, and infinity, and millions of years of time ahead, and ask again if this man that we see performing now could be the last effort of a Power with infinity at disposal. Is he not rather an experiment, and, as it may seem for the present, not the most successful? The most impressive thought, fullest in meaning of the infinite, in all the hymns of the Church is contained in those tremendous, shaking lines, simple as they seem:

A thousand ages in Thy sight  
Are like an evening gone.

There is more truth and revelation in those two lines than in a million ordinary sermons. Not long ago we here, you and I, were considering some discovery that had been made at Mizamar—which is, I think, in South America—of stone implements and human objects, seeming to indicate that man already existed in the Tertiary

epoch, which may have been anything from a hundred and fifty thousand to half a million years back from now. This age in which we live, and so painfully struggle to-day, will it be better known and remembered—or respected—in a million or a milliard years than the Tertiary is, man probably having died out, or nearly, a few times in the interval, and having, perhaps, been redeveloped? With our new comprehension of millions, do not let us lose our sense of proportion amid the obsessing difficulties with which we are at present concerned. This struggle may seem important to us; but in the scheme of the universe and infinity, in which we may be but the experiment of a moment in an odd corner of a grand system, it may be nothing. If we try to imagine or suppose a line of progress from the plainest matter, simple stirring earth just beginning to germinate, to some ultimate ideal of an infinite Power, is it not almost certain that we still, as men at war, are much nearer to the animals behind than to the gods ahead? Yet some have likened us to gods! However, we are, for all that, in the Power's control, and though but an experiment, it may happen that this experiment will prove of extreme importance and consequence in the development of the great scheme, and it is clearly our business and duty to strain with it to the limits of our capacity. That is our part in the process of development, and though we know of important experiments in destiny in ages past, we are aware of none that, the world being now so full and so much developed, has seemed so big with the fate of humanity—humanity as we know it now, and as it has subsisted through one short 'evening' of the Power. Here, then, is a test of duty, discipline, and endeavour, a clear charge to proceed with the war as well and as thoroughly as we can. This age of the world may be the critical second in the development of the universe towards some dazzling end of perfection, and there is the stupendous responsibility upon us to take the chance and exert ourselves to the utmost according to belief and strength. As a second though it be in that one short evening of a thousand ages, this era of earth, after all, has its place in the universal march. In the simple life of a human being, how often does it not happen that all his destiny, his place and circumstances, his occupation, friends, relatives, his veritable issue, and so his influence upon time and man, have depended, as it appeared, on the turning of a head, the crossing of a street, the missing of a train, or any trifle that has changed the intended action of a moment to some other, and with such change introduced a chain of other events of ascending importance! So with the war; we do not know to what it leads.

\* \* \*

The foregoing, though it may lack the appearance thereof, is a simple introduction to a glance at one of the strong features and symbols of

Washington, U.S.A. Upon first thought it may not seem reasonable intimately to associate the headquarters of America with these considerations, such as they are, of the evolution of man and his unknown fate; with the stars, the Power, the great infinity, or even the millions and the milliards with which we began. But yea, the millions, they are American things, and it was a first thought of Washington that led one to think of our modern familiarity with the massed formations of these figures which daily make great demonstrations in the newspapers. We seem to estimate their power precisely. We know the extent of their efficiency, their buying, fighting power in days of war. Above all in these days, American milliards and millions become the dominating influences. The dominance, the offensive, is with them. Washington—which we were considering a month ago—seems as a spiritual home of the million. It seems to be the power-house of the seven-figure standard; from here a golden current, giving life and energy to the Allies at war, flows to their nerve-centres across the seas. Gold of Washington roars from the mouths of guns on the Western front, in Italy, out in the East, and elsewhere. The United States—saying it with respect and admiration and, in the case of many of us, affection—is the centre of the new life of the world; only now does she begin to be thoroughly and deeply touched by some spiritual workings, and to think of destiny—of the stars and life and infinity—in a new way. Those stars upon her banner may indeed murmur a new story, make a new suggestion to her; the blood-red stripes beside them begin already to sing of sacrifice. William Gibbs McAdoo, of the Treasury, is a grand ordainer of American force. Daily the cables tell us of the achievements of this marvellous institution in which is represented the great work of the American people for a hundred years, the token of their splendid and honest labour. The other day we were informed that there was approximately a milliard of money in circulation in the United States—that is to say, about nine pounds eight shillings per head, which, in the American term, is 'the best ever,' the record. Although the Government has endeavoured to withdraw gold from circulation as much as possible, there was then still the equivalent of more than seventy-four million pounds moving in gold coin in the land. This, added to what is held in reserve, amounted near the end of last year to over eleven thousand million pounds, which was two hundred million pounds more than the previous year. A few days later there was the announcement that the Treasury Estimates reached two thousand seven hundred million pounds, of which all but half a milliard was needed for the war. Then Mr McAdoo mentioned that two milliards of pounds (keep in mind that a milliard is a thousand millions)

would have to be issued as securities in the following seven months. He reported that the cost of the war to the American people, including the Allied loans, for the two years which will end next June twelvemonth will exceed seven thousand two hundred million pounds; but he specifically warned his countrymen that 'exigencies of the future may cause changes,' and many financial experts in America believe that the total cost to the United States in two years may reach ten thousand million pounds . . . . This is the new way of reckoning the American progress in supplementary figures. It may seem to some that it is like a timid step towards infinity, and the stars on Old Glory may lead to thoughts of the stars of night and all eternity.

\* \* \*

For me, I am brought to think again of Washington, and of the Treasury there, which is the fountain of strength to the cause of the Allies. I remember a visit to the Treasury late in the afternoon of a day in the early fall. Two circumstances caused the experience to be deeply struck upon the mind. One of these was the obvious, the acute, impression of national wealth that is afforded by what is seen within that vast and majestic building at the corner of Pennsylvania Avenue and 15th Street, which, with its grand dimensions, its array of Corinthian columns, and the rest, is second only to the Capitol itself in architectural importance. The other circumstance was that here a wanderer encountered again one of those fine courtesies in the exercise of which the Americans are equalled, if by anybody, by the Spaniards alone. The Americans, wishing always to give an honest stranger some good impression of their land and people, never cease to strive after the utmost effect on the mind of the visitor. They will even incur risks and break rules. Of necessity, the regulations about strangers looking through the Treasury are strict; they are very strict indeed. No such caller is supposed to pass within the portals after two o'clock; that is a stern decree. I had postponed my visit until my last day in Washington, and then by some mischance had overlooked this rule. At half-past three I realised the unhappy truth; the single extenuation was that of having been over the Potomac out Mount Vernon way, where George Washington lived and died. However, it was necessary for me to see the Treasury, and see it well and thoroughly, be American laws what they might. Entering at a side-door in 15th Street, I explained the case to a sympathetic official. He referred the stranger to another, and the second to a third. The belated aspirant was then sent on with a certain introduction to a high official entitled the Captain of the Watch, the name suggesting for once in America something of old France, or the England of the days when there were fine uniforms about the

Tower. He was arrayed neither in colours nor in silks, nor had he a gun or a sword. He wore a black coat, and he sat at an American desk. He was told of the pitiable state a curious wanderer would find himself in did he sail the seas again towards the rising sun without having contemplated the inside of the American Treasury. The Captain of the Watch rose, shook the stranger's hand, and told off his chief secretary to afford him the most thorough inspection and explanation of the Treasury that was possible.

\* \* \*

Here are to be seen the notes prepared and new, ready to go out into the world and do their business, great masses of them representing wealth unthinkable; here too one sees others just come home again, weary and worn, being done for finally in the macerator after being cancelled. When enormous forces like millions of money are dealt with, there must be strict rules and regulations, to be obeyed with delicacy, for it is as if lightning were being handled. One observes the majestic order and system in the great Cash-Room, with its walls lined with American and Italian marble, one of the costliest apartments in the world; and one wonders upon the precautionary formalities with which the old notes that have had their day are brought to the macerator. The birth and the life of the note are interesting enough, and it is highly entertaining to look upon the extraordinary specimens of forgeries, rare as they are, that are exhibited, and to know that the most expert examiners in this special department of the Treasury are ladies; but somehow there is an odd instinct in the stranger that gives him a special interest in the place of the executioners, where, with more niceties and regulations than old-time French revolutionaries would have observed for the removal of aristocratic heads by guillotine, the authorities here work a macerator and put an end for ever to dollar and other bills that have done their duty. It is so necessary that, sentence of destruction having been passed on such a time- and work-worn note, it should be really destroyed after its formal cancellation, and not permitted again to attempt some unhallowed operation. There has already been a knife at work before the macerator is employed. The doomed notes, or bills, as they always call them in the States, are counted and made up into a thick package, and this is cut down the middle by the big blade of a special cutting-knife. One half of this divided package then goes to the Register's office, and the other to the Secretary's department. The half-sheets are counted in each office, and if the countings correspond the two lots are despatched to the macerator. The object of this process, and the reason for the care with which the final destruction is accomplished, are clear—to prevent the possibility of two halves ever being made into one note again.

There are clever people in America, and no man knows where they may not be found. And in these precautions to prevent fraud in a country where paper money was universal during generations when we affected to despise such flimsy stuff and weighed our pockets down with metal, we see something of that thoroughness which America is now applying to her tremendous part in the war. Every day the macerator does its business. It is a big spherical receptacle of steel, which contains water, and is fitted inside with a series of knives closely set together. The lid is very heavy, and is fastened down by three Yale locks, each with its own key. The Treasurer keeps the key of one lock, the Secretary has a second, and the Comptroller of the Currency keeps the third. At one o'clock every day these three high officials or their deputies, and with them a fourth appointed by the Secretary to represent the banks and the people, meet by the macerator to deposit in it superannuated money that has been sentenced to extermination. Each personage unfastens his particular lock, the ponderous lid is lifted, the packages of halved bank-notes are tumbled in, and a million dollars are done for by the one hundred and fifty-six steel knives. The mass is cut and ground finely, and more finely still, and some time later the committee of four unlock a valve, the liquid pulp of what once was notes flows out and is screened into a pit underneath, then transferred to the bureau of engraving and printing, and there rolled out into sheets of bookbinder's board, and sold for forty dollars a ton.

\* \* \*

This is the storehouse. It was stated the other day that the net balance of the Treasury had reached the new high record of one thousand nine hundred and sixty-eight million dollars. They told me that they generally kept in the building a stock of about seven hundred and fifty million dollars. They led me to the wonder of wonders, where, beyond cagings and iron bars, and with hidden electric appliances which would catch up any madman who thought he might steal from the money bosom of the United States of America, I saw a great safe, standing boldly in the light, amid an impressive stillness. This, I saw, was the Altar of Wealth. That idea leaped instantly into the mind. One would have thought it right had there been ambient golden vapours and a strange incense. Within the safe there was wealth uncountable, and—here for one of the contradictions that arise whenever we pass beyond ordinary reckonings and stride out for the country of infinity—there were other representations of wealth so great that the safe was not safe enough for them, and they had to be placed outside, on the top of it, in full view, so that the watchers and the high authorities passing by at intervals might always know that they were there. This symbol of wealth so great that safes were too unsafe for it con-

sisted of one neat packet containing four thousand notes, each of which was of the ten thousand dollar denomination, so that the package stood for forty million dollars. It rested there above the safe like an appalling concentrated power. This package of paper was stronger than many men. One felt timid in looking upon it. This is the kind of terrible power that controls the world. It is for this that men and races live, and fight, and die. It is even for this that wars are made. But at that time neither I nor my guiding American friend knew that the sum reposing on the safe would be only sufficient to pay the costs of one day of the war that was coming on. The vault in which it was stored was closed by a combination of a clock and a lock that only permitted it to be opened when a certain time-limit expired. The vault could not be entered

at any other time save by destroying it. If you or I, turned adventurous, developed a scheme for penetrating it, the only result would be that electric bells would instantly warn the chief of police and the military authorities at Fort Myer and the Arsenal, and police, cavalry, and foot-soldiers would bear down upon us. The Captain of the Watch could immediately arm a thousand men in the place itself, who would probably be able to cope with us—with you and me—even before the army from Fort Myer and the Arsenal assumed a palpable offensive. The truth is that there is a marvellous arrangement here for guarding the Treasury. It is one of the many reflections that lingered in my mind after each visit I paid to America of a tremendous thoroughness where most needed, and those memories are a comfort now.

## THE FORESTER'S GIRL

### CHAPTER VIII.

**W**ITH hard, unseeing eyes David Hardy stood staring after the vanishing horseman; then, rousing himself with a jerk, he re-entered the cabin, and began setting it in order for a long day's absence. This done, he arranged his practical forester's dress as neatly as though for a holiday jaunt—clean, dark flannel shirt snugly buttoned round his short, bronzed throat, broad leather belt with furnishings of hatchet and cartridges, corduroy breeches, and heavy nailed boots, laced and buckled to his knee. Although of only average height, he was well knit, without an ounce of superfluous flesh, and a face at first sight so attractive by reason of bright brown eyes, ready-smiling mouth, and firm square chin, that only a physiognomist would have noted other less amiable traits in the black brows rather too nearly meeting, and a certain dourness which brooded upon his features in repose.

Reaching for his wide-brimmed felt hat, about which by way of band was twisted the mottled skin of a rattle-snake with tassel of several well-developed 'rattles,' he caught his own reflection in the hanging glass, revealing Nat Duncan's handiwork in all its grotesque defiance of tonsorial art. From the back of his head and round about his ears the hair had been shorn so close that barely would pincers have availed to pick it up, whereas upon the crown, and tossing wildly about his forehead, survived a great touse of jetty curls, which, when pressed down below his hat-brim, gave the whole countenance a sinister expression.

For a moment the unfortunate victim of this outrage gazed half-startled at his own image; then, angrily exclaiming, 'The infernal fool!' flung out of the cabin, slamming the door behind him, and consigning the key to its usual hiding-place, betook himself to the wood-shed,

snatched up a bridle, and hurried across to the corral.

A long search for his horses in the wide-lying meadow, with its constantly encroaching bush and groves of young spruce and pine, did not improve a temper already sorely tried. David Hardy, however, was not the sort of man to avenge his own personal grievances upon an animal, albeit it was with neither caress nor friendly greeting that he slipped the bridle over the head of the fresher of his two horses and led it away to saddle. David was that type of person whose animals, though they may not fear, yet never aspire to the proud dignity of friendship, because an unerring instinct informs them that to such a one an animal is merely an 'animal,' and 'nothing more.' Thus to David no horse ever came on the gallop with glad neigh and soft, caressing muzzle; dogs only sniffed at his boots and passed by; cats (canniest appraisers of man's best-concealed idiosyncrasies) crouched and hid at sight of him, or fled on swift, soundless feet. This misfortune on the forester's part—for a misfortune it assuredly is, thus to miss a host of friends in the anteroom of life—was, to do him justice, not the result so much of natural temperament as of certain conditions and influences that shaped his childhood.

The eldest of a large and ever-increasing family of children, whose parents had little leisure from the pressure of the moment in providing food and clothing for rapidly growing bodies to lavish caresses upon them, his earliest recollection was of his father's sharp command to 'sit down in a chair and not bother,' when, as a very small boy, still in pinafores, he had cried to be taken on his mother's lap, upon which perched a fat little brother, while already in the cradle a tiny sister made faces and wailed to be lifted.

Their mother, hearing the rough chiding, had hastily wiped the tear-stained little face of her first-born, and whispering into his ear, 'David is a *man* now!' had sown in the child's swelling heart the first seeds of that self-repression which forms so large a part of the thorny crown of maturity. From that hour all infantile indulgences were sturdily thrust aside in a pathetic endeavour to prove himself the man his mother said he was, and in this he was encouraged by her secret ambition that this eldest son of hers should rise to a fitting place in the world. For David's mother came of good stock, the daughter of a schoolmaster in a town not large, but sufficiently so for his social position to be no mean one; and although as a mere girl she had rather stepped outside of her own circle by marrying a young master builder, she carried to her new home, and later to the cradle of her first-born, the determination that her father's grandchildren should not disgrace him. But a rapidly filling nursery in a small house that was *all* nursery, the scarcity of money and of help in the household laying upon her devoted pair of hands the work of half-a-dozen, had compelled her to concentrate all her energies upon the physical well-being of her children, and the hurt to her pride resulted in a seeming austerity towards them and a rigid economy in the management of the home. Toys were few; pets there were none. The dog which followed his master to and from his daily work had no place in the family life; the fear of dirty paws prohibited his entering the house, kennel he had none, and his bed, summer and winter, was the door-mat. The one cat, suffered to exist solely because of the depredations of mice in the larder, took pot-luck with the dog, was never allowed to come into the kitchen, let alone to raise a kitten, and fled at sight of the children.

'There are mouths enough to feed, and sufficient work keeping you children fed and clean, without having cats and dogs all over the place,' Mrs Hardy would insist when one of them begged for a kitten or a puppy.

So, although no children better dressed and shod attended the village school, they entirely missed the wholesome influence and happiness of living creatures dependent upon their care, and grew up on purely self-centred lines. From his mother, too, the little David early learned the precept that 'a penny saved is a penny earned,' she having given him a wonderful savings-bank in the shape of a large metal dog, painted brown, by the pressure of whose stiffly feathered tail the big mouth opened, and any fraction of a dollar, from a copper cent to a silver 'quarter,' was greedily swallowed down a vermilion throat. Once within its spacious stomach, there was no recovering the valuable provender without smashing the dog; and so, although at first David had been delighted to feed it with every available penny, he soon

learned to regard the toy with anything but a friendly eye, inasmuch as all his slender store of pocket-money was invariably consigned to the metal dog and beyond retrieve.

Added to this, his first glimpse into another home, and a philosophy other than that in which he was reared, resulted not in a softening of his early view of life, but rather the reverse. It happened on this wise. When David was about eleven or twelve years old, already adding, during his holidays, small earnings to the family income and more 'food' to the metal dog, there came to live in the village some Scotch people, whose tow-headed, rosy-cheeked, sturdy-legged offspring were schoolfellows of the Hardys, and who for a time bought milk of the Hardys' cow. David, being one evening commissioned to deliver the new milk, tapped at the door of the kitchen, which the Andersons, unlike the majority of their Californian neighbours, used also as the family sitting-room. David, being admitted, and sitting awkwardly on the edge of a chair, rolled his quick, brown eyes round and about him in mute astonishment. It seemed to him as though the room were filled with animals. On a rug before the fire a large collie lay watching his mistress busily stirring a goodly pot of oatmeal; another dog, of a nondescript kind, was curled up (wonder of wonders!) in a deep, cushioned chair beside his master, on whose knee, as well as on the foot of the stove-oven, on a corner of the table, in the window, were lying cats of all sizes; while kittens rolled and romped, and raced up and down the curtains, the entire family laughing merrily over their antics. Then, just as Mrs Anderson, pouring the porridge into bowls and adding milk, had set it on the floor for the two dogs, there was a scrape-scape at the door, a skirmish among the children as to who should be first to open it, and then there bounded in a great, clumping puppy, his big paws brown with mud, and began leaping up at his mistress. Mrs Anderson, hastily gathering up the clean apron with which her ample waist was girt, laughingly made pretence of scolding, while the children shrieked with delight; and even their father, taking the pipe from his mouth, joined in the fun, saying, 'Have a care of your braw apron, mithers. "Jock" cares na ane straw for clean claes.—Ah, but you're a bad laddie, "Jock,"' he went on, shaking at him a reproving finger, and then leaning forward to pinch the ear of the truant, who, unabashed, was fawning on his knee and licking the cat's face. 'Best gi'e him his parritch and a drop o' the new milk, Jean,' he said to his wife. 'It'll maybe learn the prodigal that there's nae place like hame.' And Mrs Anderson, half-protesting, nevertheless took the lid from the milk-tin, and added a judicious cupful to the puppy's portion of supper.

All this time the boy David had sat a mute and amazed spectator of this domestic miracle—

play. Too young and uninstructed to see beneath the surface or rightly to appraise the relative value of things in life, he felt his heart swell and harden at sight of so much affection and tenderness, of which he himself had had so small a share, lavished upon mere animals; and when before his eyes the great, dirty pup, with forelegs well apart and head thrust forward, began gulping down the sweet new milk, the very drops of which David's own mother almost counted, it seemed to him as though his metal dog had come to life, and were swallowing down good money. Feeling he could endure no more, David rose abruptly, and holding out his hand for the empty tin, bade the Andersons good-night, and hurried out into the quiet street. All the way home the lad puzzled and brooded over what he had seen, and, ere he reached his mother's door, had left childhood behind in registering a vow that one day he would have a home of his own such as the Andersons' seemed to be, with food and drink to spare, but never a wastrel dog to devour his substance.

Thus had David reached cross-roads, and his mother, all-unconscious of the initial reason, secretly rejoiced to see how the boy, though by no means clever, suddenly set himself to forge his way through both the primary and the high school. It was then that David, his parents being unable to send him to college, got his chance. An old friend of his mother, who by his own efforts had risen to a position of wealth and influence, took a fancy to the brown-eyed youth of whose grit and steadfastness he heard such good reports, and contrived to procure for him, despite his qualifications not being quite up to the standard which the State required, a post as assistant-forester on the National Reserve of big timber.

'He'll make good,' his sponsor had assured the powers that be; and David had so far not disappointed him that within a few years he was appointed full forester of the Laughing Lake district, and consequently felt himself in a position to propose to Anita Lalonne, the pretty

little school-teacher in a valley town, with whom he had fallen violently in love.

His long-inculcated spirit of prudence dictating that they should not be married at once, David had for two years scrupulously saved his salary; had even, realising the risks that beset a forester's life, managed to pay the premium on a small insurance to provide for Anita in case of his death; while she, on her part, laid up a nice little nest-egg by giving French lessons to the would-be young ladies of the town into which, like a brown beech-leaf, she had one day been blown from somewhither on the wings of an autumn wind.

Now, however, the forester had at last felt justified in taking the final step towards making Anita his own, and as it was impossible for him to leave his mountain post to wed her, had induced the girl to come to him, promising her protection with kind people until they could go together to the lumber, mushroom village of Keyes Mills, where a minister could be had to tie the knot.

Having counted the weeks and days until school closed and she was free to come, bitter indeed was David's disappointment when, his fellow-forester, Jim Neil, being temporarily laid by with injuries from a falling tree, double duty and the care of the sick man devolved upon himself, and his cherished project for meeting his 'girl' had to be abandoned. When to this was added the failure of the expected letter and Nat Duncan's unintentionally mischievous badinage as to his sweetheart and the stranger Englishman, David's somewhat morose and jealous temper was thoroughly roused. It was, therefore, with black brows and brooding thoughts that the forester again turned his horse's head up the long, difficult trail that led to Niel's distant cabin, savagely reflecting that probably at that very moment another man—an interloper from across the sea—would be enjoying the company and admiring the beauty of his own betrothed wife. In his heart David Hardy cursed Gavin Barrie.

## VISIONS OF DANIEL, PROPHECIES OF JOHANNES THE MONK AND OF HERMANN ABOUT THE HOHENZOLLERNS.

By R. C. WYNDHAM, Author of 'Predictions and Prophecies Relating to the Kaiser.'

**T**HE visions of Daniel, and their interpretation, as recorded by the prophet in chapters vii., viii., and ix., would appear to refer to different events, for it is evident that the 'seventy weeks' (chapter ix. 24) have no reference to the 'seven weeks and threescore and two weeks' of the next verse. A careful examination of verse 24 will show that the seventy weeks had no connection with the Babylonian captivity and the return of the Jews (536 B.C.) to their own land.

Besides, Daniel says in chapter ix. verse 2: 'In the first year of his [Darius] reign I Daniel understood by books the number of the years, whereof the word of the Lord came to Jeremiah the prophet, that he would accomplish seventy years in the desolations of Jerusalem.' Daniel then prayed for an interpretation of the visions which he had in the first and third years of Belshazzar, and this was vouchsafed him, as we read in chapter ix. 'The king of fierce coun-

tenance' (chapter viii. 23) evidently had no connection with the captivity or with the other periods mentioned in chapter ix. He was not to arise till the mystic 'seventy weeks' were accomplished. The seventy years reckoned from 606 B.C., when Nebuchadnezzar took Jerusalem and carried away the inhabitants captive, till the year 536 B.C., when Cyrus gave them permission to return to Jerusalem. The seventy weeks represent seven cycles. As the mathematical cycle is calculated by the number 10, so there would be seven cycles in the seventy weeks, and as the Jewish solar cycle numbers 360 days, so in seven times 360 we get 2520; then by subtracting 606, the first year of the captivity, we have the number 1914, the year the present war broke out. This was illustrated in *Chambers's Journal* for 1917.

The predictions *Vaticinium Lehninenses* were given by Hermann of Lehn in Brandenburg in the year 1240. The manuscript was presented to the public library of Magonza (or Mayence, as the city is now called), and is probably still there, by Albert, the brother of Joachim I., Margrave of Brandenburg in the fourteenth century, and the first printed edition of it appeared early in the eighteenth century. Several editions were afterwards issued at various times, the latest being in the year 1891, by Desclée & Co., of Lille, with branch houses in Brussels and Rome. This edition was entitled *Hermann et Hohenzollerns*.

The following are those clauses which refer more particularly to Germany and the Hohenzollern dynasty:

**1319 to 1373.**—'Brandenburg begins to languish without being mortally stricken. The habitation of the house of Otho is now transformed into a den of lions, and the rightful heir of the blood of Ascanias shall be excluded from the succession. The energy of the Cæsar will triumph.'

**Fulfilment.**—Dissensions in Brandenburg during this period gave Ludwig of Bavaria (the Cæsar) the opportunity of making his son Margrave of Brandenburg.

**1373 to 1411.**—'Brandenburg is hidden under a refuge but little secure. For the second time the royal line is directed elsewhere, and our country ceases to see in its direction its legitimate rulers and nobles.'

**Fulfilment.**—On the death of the Emperor Charles IV. his sons Wenceslaus and Sigismund abandoned Brandenburg. The former became Emperor of Germany, but was deposed in 1411, and succeeded by his brother Sigismund. For the assistance rendered him to ascend the imperial throne by Frederick of Hohenzollern, Burgrave of Nuremberg, he invested the latter with the title and dignities of Elector of Brandenburg (1411).

**1411 to 1440.**—'Thou, my beloved Branden-

burg, will issue from thine obscurity and will have possession of two burghs. Called to long life, the race which governs thee shall have a limited territory until it can issue beyond its bounds and conquer its vassals.'

**Fulfilment.**—The Hohenzollerns laid claim, and made good their claim, to Pomerania, a territory lying between Brandenburg and the Baltic. The Hohenzollern dominions were now divided between the electoral and the Franconian branches of the house.

**1598.**—'The ruler of Brandenburg during this funest year will die in a splendid castle.'

**Fulfilment.**—In 1598 a dreadful pestilence ravaged all Brandenburg, and the Elector John George fell a victim to it in his splendid castle on the river Spree.

**1640 to 1688.**—'Now arise those who inscribe three burghs among their titles. Under the reign of a grand prince Brandenburg will have a still further extension.'

**Fulfilment.**—At the beginning of the eighteenth century the Franconian line became extinct, by which Joachim Frederick, Elector of Brandenburg, acquired Pomeranian Cleves, Julich, part of Silesia, and part of East Prussia. Silesia the elector bestowed upon his son John George, and Franconia on his half-brother.

**1797 to 1815.**—'Germany will groan under much trouble, and will be greatly cast down.'

**Fulfilment.**—In 1797 Napoleon I. sent an army against Germany under the command of General Moreau; this was called the army of the Rhine and Moselle. The German army sustained in 1805 defeat at Austerlitz, and again at Jena in the following year. By the Treaty of Tilsit (October of the same year), Prussia lost half of her territories; however, by the Congress of Vienna, in 1814 she regained all that she had been forced to resign at Tilsit.

**1830 to 1861.**—'Disturbances in Europe will cause troubles in Prussia.'

**Fulfilment.**—The revolutions in various parts of Europe during this period had their effect on Germany. Riots occurred in several parts of the Empire, especially in Berlin, Cologne, Frankfurt, &c.

**1861 to 1888.**—'The son [of Frederick William III.] will have a glorious reign. He will possess what he never dared to hope for. I see approach the time in which he will have a marvellous stroke of fortune. Finally the sceptre is in the hands of him who will be the last of this royal line. He will have for his successors a king of Poland, a king of Hanover, and a king of Saxony.'

**Fulfilment.**—The first part of this prediction was fulfilled by the results of the wars of William I., German Emperor, in 1870. In 1864 he gained possession of Schleswig-Holstein; in 1866 he drove Austria from the German Confederation, and seized on Hanover; and in 1870 he acquired Alsace and Lorraine, and was

proclaimed German Emperor. The second part of the prediction was fulfilled by the accession of the present Kaiser to the imperial throne in 1888; the last part has yet to come.

THE RISE AND PROGRESS OF THE HOHENZOLLERNS.

Brandenburg, the original nucleus of the Prussian kingdom, was at first an inland district inhabited by the Suevi, a people which comprised a great number of migratory tribes, and were so called in contradistinction to the more settled tribes of the Ingaevones. Cæsar represents them as divided into a hundred cantons. They were subsequently supplanted by a race of Vandal origin. In the seventh century A.D. the provinces on the outskirts of the German Empire, of which Brandenburg was one, were called marks or marches, and were administered by governors called marchgraves or margraves. Under successive rulers the country made some figure, especially under the Ascanian margraves, descendants of Otho the Great of Germany, but in 1411 Sigismund of Bavaria (as before stated) created Frederick of Hohenzollern Elector of Brandenburg. The rest is told above.

With regard to the prophecies of Johannes the Monk, which were uttered by him about the year 1600, the manuscript is in the archives of S. George, in Venice. As it is not easy to get at it just now, it may be interesting to know that there exists in Rome a book called *Vaticinia Sæ Prædictiones Illustrum Virorum*, published in Venice by Gio. Battista Bertoni in the year 1605, in which the prophecies are annotated. This book the writer has had the advantage of

seeing and perusing, and it can be seen any day. It is printed on vellum, in Latin and Italian, and is in fairly good condition, but somewhat discoloured by age.

The English poet Thomas Joseph Moulton about the year 1500 prophesied many events connected with the present war. Among other things, he says: 'In 1917 there will be a new form of government in a great empire.' The fulfilment was certainly in the revolution of Russia.

Another English poet in 1762 wrote: 'The last Emperor of Germany shall be paralysed in the arm, and will mount his horse on the opposite side.'

Many other instances of predictions being fulfilled in their time I might give, without fear of being accused of superstition. What of Agabus (Acts xi. 28), who prophesied the dearth which should take place throughout the world, and 'which came to pass in the days of Claudius Cæsar'? Nor need we inquire too strictly into the sanctity of those individuals thus gifted with second-sight. Was Balaam a good man when he prophesied the star in the East that should arise at the birth of the Saviour?

We are told in I. Corinthians xii. 10 that to some is given the gift of prophesying; and again in I. Thessalonians v. 20: 'Despise not prophesyings.'

It is to be presumed that St Paul's Epistles, though written expressly to the various Churches, were yet intended for the edification of Christians through all time. Shall we not, therefore, accept his admonition: 'Wherefore, brethren, covet to prophesy, and forbid not to speak with tongues' (I. Corinthians xiv. 39)?

## JOCK'S NEEBORS.

### CHAPTER II.—NUMBER TWO.

**T**HOROUGHNESS was Jock's strong point. When he slept, nothing would wake him, not even a 'Black Maria,' so long as it did not hit him. Therefore it was not surprising that he was unconscious of all that was taking place around him in the early hours.

When at last he rubbed his eyes open and stared about, the first thing he noted was that the next bed was empty, the mattress was rolled up, and all the linen removed.

'He's been richt efter a,' he muttered to himself. 'Wha wad hae thoct it? An' noo I'm left wi' a lawyer's job.—Hey, nurse, at what oor did Dauvid Graham slip awa'?'

'At six this morning,' replied the sister, as she stopped in passing. 'He'll find it hot enough where he's gone to.'

'Nurse, ye're irreverent,' retorted Jock in a shocked tone. 'What ails ye at Dauvid Graham? He was a decent sort, an' a Scotsman.'

'I have said nothing against him.'

'Weel, ye hae pretty clearly implied it, onyhoo. Why should ye send him whaur ye said? He never did ye ony harm.'

'Jock, you are the funniest creature out,' laughed the nurse, 'and the most provoking. You always take people up wrong. How could I say where he was to go? It is the colonel, of course, who decides that.'

'Then the colonel tak's a mighty deal mair on hissel' than he ocht to'—

'Jock, be quiet, or you will get into trouble,' said the nurse warningly.

'An' then ye'll be sendin' me next to the same place.'

'Yes; if you develop any more temperature you will go at once.'

'Ye've an' unco' queer way o' pittin' it, nurse, no to say callous. Ye can tell the colonel frae me that it's no i' his haunds to send puir Dauvid whaur ye said. I'll hae naethin' to dae wi' they papish doctrines.'

The nurse looked critically at her patient, put her hand on his brow, and felt his pulse.

'Now, Jock, you must lie very quiet, and not talk, or else they will be sending you after your friend, and we do not wish to lose you. Besides, remember, the nurses there will not be so good to you.'

'It's the first time I ever heard o' there bein' nurses i' that place. Dae they keep a stock o' ice tae?'

'Yes, for the worst cases.'

'Weel, I wish I was the Kaiser, then.'

The nurse looked puzzled, then anxious. 'You must just shut your eyes, and try to go to sleep,' she said soothingly.

'No likely. I've got Dauvid's wull to attend to first, an' it doesn't maitter to the lawyers whaur he's gane to, as lang as he's deid.'

'But he is not dead, or anything like it,' responded the nurse, with a new light in her eye. 'They have only taken him to the fever hospital.'

Then Jock's bed shook as if it were in the throes of an earthquake, and peal after peal of uncontrolled laughter startled the ward.

'He told me last nicht that he was deein', an' when ye said that he had gane I thocht it must hae been true.'

'Oh, it is only a slight touch of dysentery. He will be well in a few weeks,' the nurse replied, laughing now herself as she realised the grim misunderstanding.

'Ay, that's aye the way wi' they dysentery patients; they live i' their boots,' muttered Jock, 'an' spend their time writin' wulls.'

Later in the day a new neighbour arrived for the empty bed, and Jock's interest was aroused again. From divers moans he concluded that the man was pretty badly wounded, so he did not obtrude himself. But tea has a wonderfully social influence, and the new-comer could not resist a smack of the lips and an exclamation, 'That's guid!'

'Ye're feelin' better noo?' asked Jock, ready to take advantage of the smallest opening.

'Ay, better than I'll be for mony a day to come.'

'Weel, if that's the way ye look at it, I expect ye're richt,' Jock remarked with a touch of sarcasm in his tones. 'If ye expect trouble ye'll get it i' this warld. I aye notice that the applicant for a situation, for instance, wha lets his mouth droop gets juist what his face foreshadows—disappointment. Sae cheer up, old man. I have had one neebor wi' dysentery a'ready, an' I dinna want anither.'

'It's my leg that's the maitter wi' me,' responded the new-comer. 'I got it badly smashed when oor ship was submarined, an' they're gaein' to operate on it to-morrow, an' perhaps tak' it aff. Sae I hae guid reason for what I said.'

'Sae ye were on that ship tae. I wonner if

ye kenned anither Scot named Dauvid Graham?' asked Jock, with a curious smile on his lips.

'Dauvid o' Kilmachie? Rather! He an' I used to be great pals. Weel, up till last year. But I maun forget a' that's come between us, for he saved my life. If it hadna been for him I wouldna be here the noo.'

Jock's eyes kindled with a new interest. He was certainly on the scent of something fresh in human nature.

'Hoo did he manage that?' he questioned.

'We were baith i' the same cabin whaur the torpedo exploded. The water rushed in an' filled it to the roof afore we could dae onythin'. I saw Dauvid get oot o' his bunk an' feel his way towards the exit above us. I tried to follow, but at that moment a big table that was floatin' aboot bumped richt on the tap o' me, an' I was caught a prisoner underneath it. I made an' effort to shout to Dauvid, but the water only got intil my mouth. He had seen my deeficulty, hooever, an' though he was gey exhausted hissel', he did a brave thing.'

'What was that?' demanded Jock breathlessly, for the story was taking a most unexpected turn.

'He lowered hissel' down, an' liftin' his leg, he gave the table a mighty kick that knocked it clean aff the tap o' me, an' I got free, an' rose to the surface juist efter him. He was ower exhausted to notice me, an' I was ower done oot to gae up to whaur he was lyin' on the deck. They pit us intil different boats, an' I hae never had the chance o' seein' him to thank him for savin' my life; but I'm gled I've met a freend o' his. Whaur is he noo?'

'He was in this very bed ye're in; but they took him awa' this mornin' to the fever hospital. He's no very bad, the nurse tells me. I'm thinkin' he'll be gey gled to hear ye're alive,' Jock said with the emphasis of conviction. Then he added, 'Ye'll be Dugald M'Callum?'

'Ay, that's my name. Did he tell you that he had saved me?'

'Na,' answered Jock truthfully.

'He's been gey modest aboot it, an' that mak's it a' the mair praiseworthy,' remarked Dugald M'Callum with enthusiasm. 'He was aye a guid sort, an' I did wrang to think ill o' him; but I'll mak' it up to him noo. Ye're a stranger, but I think ye'll dae ane thing for me.'

'Onythin' i' my power.'

'Weel, I hae a kind o' feelin' that I'll no staund the operation to-morrow, an' if onythin' was to happen to me I wad like to leave Dauvid somethin'.'

'In yer wull, ye mean?' suggested Jock, who was now beginning to feel a bit of a lawyer.

'No that exactly,' said the other hesitatingly.

'I understaund,' interrupted Jock. 'Ye're no quite sure hoo to work the document. Tak' a piece o' paper, an' I'll tell ye'—

'Na, ye dinna grasp it quite. What I want

to leave him canna be pit down i' a wull. It's no siller or guidas. I havena muckle o' that, onyhoo.'

'What is it, then?' asked Jock, puzzled. He had already torn a sheet from his writing-block, and made a flourish or two with his pencil. Now he stopped, mystified.

'It's a young leddy,' began M'Callum.

'Ye're richt,' interrupted Jock again. 'We canna pit her on to paper.' He dropped his pencil, and glanced inquisitively at his neighbour.

'Weel, it's this wey,' continued the other. 'We are baith i' love wi' Mary M'Millan; but it's clear to a' that she's ta'en a fancy to me. I was sorry for Dauvid, but, o' course, life has its disappointments. Hoosomever, efter I'm gane I dinna want Mary to be left a widow, so to speak. Sae, if I dinna get through the operation to-morrow, I want ye to send word to Dauvid sayin' that I've left her to him.'

'I'll dae that for ye,' said Jock. Then he added meditatively, 'Div ye think I ocht to mention the maitter to the young leddy hersel?'

'Ay,' replied the other after a pause. 'It wad maybe be best. Ye can tell her that it was my last wish, an' that she's no to judge Dauvid by his face, but by his he'rt, and'—the speaker gulped something down in his throat—'for my sake she maun mak' a guid wife to him.'

'Noo,' said Jock, assuming a more important air, 'I think I ocht to tell ye somethin'. Yer freend, Dauvid Graham, made oot a wull, which he entrusted to me. Here it is. Perhaps I ocht not to show it to ye afore he's deid; but the nurse says he has only a mild attack o' dysentery, sae it micht be a lang time to wait, an' as ye hae been sae generous to him, it's but richt that ye should ken that he's left everythin' he has to ye.'

'Ye dinna mean that!' exclaimed M'Callum, sitting up in bed.

'Ay, it's a' here i' his last wull an' testament, an' it's no as if he hadna muckle, for he telt me hissel' that he had a lot o' property.'

'Weel, a' I can say is that it's juist like Dauvid. He's aye been a real guid sort, an' I hope he'll no dee.'

'Ye're the richt kind o' freend to hae,' responded Jock in tones of admiration. 'I'm thinkin' ye're weel matched, an' I hope that ye'll baith live lang an' be the best o' pals a' yer days.'

#### CHAPTER III.—NUMBER THREE.

THE bed was vacant again. Dugald M'Callum, after his operation, which turned out to be a slight one, was taken to another ward. So for some weeks Jock had no immediate neighbour on his right, until one forenoon a big Australian was carried in and laid between the sheets.

Jock waited his chance, and some hours later, when the new-comer had turned towards him, their eyes met.

'What's happened to ye?' asked the inquisitive Scotsman.

'The best stroke of luck I have ever had in my life,' replied the Australian.

'Ye're the richt sort o' man for a neebor. I thocht oor nurse said that ye had broken yer leg.'

'Something a great deal worse than that, my dear fellow,' laughed the other with the outspokenness of the Colonial. 'I had two accidents on the ship coming out from England. The first and least was the breaking of my leg. I slipped during a rough sea, and fell down the companion-way. I had got a run to England after being wounded in Gallipoli, and was on my way back.'

'An' what was the second accident? The nurse didna mention anither,' was Jock's inquisitive comment.

'Not likely. I did not tell her. Women are not to be trusted with these secrets. But you look a decent sort, Scotty, and when a fellow is happy he has got to tell somebody. The fact is, the next thing that snapped was my heart. They got me a perfect daisy of a nurse. I should call her a bluebell, for she is a Scot like yourself. That is why I have taken to you already. I know a good thing when I see it; so I was not long in telling her that she had to mend something more important than a fractured leg—something she had broken herself; and she did it. My heart is all right now, and I do not mind about my leg; in fact, I will be rather glad if it keeps me in Malta a bit. She has come to be a nurse here. I only hope she is sent to this hospital. Then my luck would be complete. I will introduce you to her some day, for she will be sure to find me out. You see, we are engaged already, and as soon as I can stand up we'll get married. Hallo, here she is! Speak of angels!—'

Jock looked round to see a sprightly V.A.D. tripping down the ward, her fresh cheeks tinged with a deeper glow than that of the sun. 'Ay, she's as bonnie a Hielan' lass as I hae seen,' he muttered to himself.

'Let me introduce you two Scots to each other,' said the Australian, after he had welcomed his fiancée. 'What did you say your name was?'

'Jock M'Gowan.'

'And this lady,' continued the Australian, 'is Miss Mary M'Millan of—of— I'm afraid I can never get my tongue round these Scotch names.'

'Kilmachie,' she answered. 'Have you heard of it?'

'Rather!' exclaimed Jock. Then he could not refrain from adding, 'I have two friends there. Perhaps you may know them—Dauvid Graham and Dugald M'Callum?'

He watched with a smile her cheeks getting even a deeper red.

'Yes,' she replied.

'Baith guid pals?' he continued.

'They used to be, anyhow,' she laughed slightly.

'Weel, I never!' Jock startled them with his exclamation.

Two men in blue were coming down the ward. David Graham was giving his arm to Dugald McCallum, who was limping along at his side.

'We thocht we wad pay ye a veesit thegither,' said David, his eyes too closely fixed on Jock to notice who was standing beside the neighbouring bed. 'I'm convalescent noo, sae I cam' ower to see Dugald, an' found him able to limp a bit; sae we made up oor minds to come along an' see hoo ye were gettin' on.'

'Ye couldna hae choslen a better time. I dinna need to introduce ye to this lady?' responded Jock.

'Mary!' Both uttered her name at once.

The girl's colour fled, and she remained silent in her astonishment.

Jock, though he was inwardly laughing, came to her rescue. 'Ye'll hae to congratulate her, boys,' he said. 'She is to marry oor Australian freend here; an' I'm thinkin' they'll mak' a richt guid pair.'

Then, turning to the Colonial, he said, 'Here are twa o' the best pals ye hae ever met, an' I'm thinkin' they are muckle indebted to ye for the continuance o' their freendship.'

It was wicked of Jock, but sometimes he was mastered by a spasm of naughtiness; and, besides, only three understood the real meaning of his words.

'It will always be a pleasure to do my utmost for Mary's friends,' the Australian answered.

'You have done your best already,' was Jock's puzzling reply.

The two turned away, and limped down the ward in silence, their friendship more cemented than ever by their mutual disappointment.

THE END.

## THE MONTH: SCIENCE AND ARTS.

### NEW SOURCE OF PAPER-PULP.

**R**EFERENCE is made in the *Indian Trade Journal* to experiments which have been carried out by a well-known agricultural and technical chemist in Queensland, Australia, with a view to utilising the lalang, or 'blady' grass, for the manufacture of paper-pulp. This grass is very similar to the esparto grass found in North Africa and Spain, which is said to make the best paper-pulp known. These experiments, which have been entirely successful, should lead to a valuable industry, as the growth of blady grass in Queensland is so extensive that it has become a serious nuisance. Moreover, it yields three crops a year.

### SOUND-WAVES ACTUALLY SEEN.

According to correspondents of *L'Astronomie*, sound-waves can sometimes be actually seen against the sky near the front when heavy gun-fire is going on. The appearance takes the form of rapidly moving waves of light and shade, and on one occasion this phenomenon was witnessed by all the members of a battery of artillery. The waves vary in size, being larger for heavy artillery, and smaller for lighter guns. In another instance, sound-waves seen by a French curé took the form of circular arcs having a very large radius, the appearance being similar to that caused upon the surface of water when a stone or other object is flung into it. A third observer describes the appearance on another occasion as resembling the spokes of an enormous wheel.

### MOTOR FIELD-KITCHEN OF CAPACITY.

In preparing the equipment for her army, America had the advantage of being able to utilise the experience of the Allies during the last three and a half years, and naturally she has done her best to 'go one better.' Aircraft manufacturers have co-operated to produce what is known as the 'Liberty' engine, which is claimed to be as near perfection as existing knowledge and experience permit, while lending itself to standardisation and manufacture in large quantities. Another item of equipment which has been evolved on similar lines is the 'Liberty' truck, an army lorry of the heavy type, capable of carrying loads up to five tons. A still more recent invention is the motor field-kitchen, which is capable of serving three hot meals a day to two thousand men. The idea for this truck originated with Mr J. C. La Vin, the manager of a well-known hotel at Newhaven, while the chassis was supplied by Mr C. M. Bradford, and the body by Mr H. D. Baldwin. The cooking utensils consist of two ninety-gallon kettles for stew or fruit, and two coffee-urns, each of fifty gallons capacity, all heated by steam. The steam is derived from a boiler of ten horse-power, and the chassis is driven by a powerful motor, which gives it a speed of nearly fifteen miles an hour. Two of the field-kitchens are capable of feeding a full regiment, either in camp or on the march; and one, with its complement of two cooks, is said to carry out operations previously requiring two kitchen units of eighty men and forty horses.

At a recent demonstration at Newhaven, Connecticut, one thousand seven hundred and fifty men were fed in less than an hour. An electric dynamo is to be added to the equipment, which will be driven by the motor when the kitchen is stationary. Enough electricity will be available from this source to light up the men's quarters, and to operate a search-light and a field wireless station.

#### VISIBLE WIRELESS SIGNALS FOR GERMAN AEROPLANES.

Owing to the deafening noise from the engine exhaust and the propeller, a pilot or observer in an aeroplane cannot hear wireless signals in the ordinary way; and, according to Mr William Dubelier, a New York radio-engineer, who actually saw in Vienna the apparatus which he recently described in *The Electrical Experimenter* (New York), the Germans have perfected apparatus whereby wireless signals are transformed into visible representations of dots and dashes. Described generally, the instrument consists of a sensitive galvanometer (an appliance which indicates the passage of electric currents) in co-operation with a lamp and a mirror that project the movements of the galvanometer into a prismatic binocular, through which they are seen by the observer. These movements are long or short according as dashes or dots (Morse code) are being received. The messages are picked up as usual by antennæ, in the form of intermittent currents of electricity, these being passed through the galvanometer, with the results already described. The outfit is provided with 'tuning' apparatus, which can be adjusted to suit the wave-length of the instrument transmitting the message, this adjunct being needed by all wireless receiving appliances.

#### POWER FROM THE INTERNAL HEAT OF THE EARTH.

Under the heading of 'Volcanic Steam as a Source of Power,' reference was made here last February to the utilisation of the natural steam which is obtained from bore-holes in certain parts of Tuscany. When the above-mentioned note was written about twelve thousand horse-power was being generated from this source, but it was suggested that, 'as the supply of steam is almost unlimited, we may expect to see a very large development of this natural source of power in the near future.' It is now reported that extensions are being added to the generating plant which will increase the output to fifty-five thousand horse-power; while a project is on foot for utilising the sources of volcanic heat near Naples, where high temperatures are met with at comparatively shallow depths below the surface. These schemes are, however, dependent upon exceptional natural conditions, and it has occurred to an American engineer, Mr Nathaniel B. Wales, that similar conditions could be produced arti-

ficially. According to Mr Wales's plan, two or three tubes should be sunk in the ground where heat is likely to be met with comparatively near the surface, until a temperature of 350 to 450 degrees Fahrenheit is reached. These tubes are of different sizes, and arranged one inside the other, leaving space enough for steam to come up between them. Water is to be pumped down the central tube and into the heated crater at the bottom, where it would be turned into steam, and rise up through the spaces between the inner and the outer tubes to be utilised for generating power at the surface. Many areas are said to exist in the United States where the necessary temperature would be met with at depths of under five thousand feet. Whether such sources of power will prove a commercial success depends upon the cost of the tubes compared with that of coal; that is to say, if the interest on the capital needed to sink the tubes, together with the annual charge for depreciation thereon, comes to more than the cost of coal for a given horse-power, the natural power will not prove a commercial success. The extent to which such power is likely to be utilised, therefore, depends very much on the depth below the surface at which sufficient heat is to be found.

#### FERRO-CONCRETE SHIP LAUNCHED BOTTOM UPWARDS.

Since the subject of concrete ships was treated here in April, developments in this direction have been proceeding rapidly, and ferro-concrete vessels are being built in Norway, Sweden, Denmark, the United States, Canada, and this country. A motor-ship of six hundred tons is already in service, while another of one thousand tons has been launched, and will shortly run her trials. One interesting development is the plan of launching ferro-concrete vessels bottom upwards, which has been originated by the Porsgrund Cement Company, Norway. This method has been adopted to simplify the moulds for running the concrete, while it is said to give better results. As already explained in our previous note, a framework is built up of bars and wire-netting, and it is essential that this steel-work should be embedded in the concrete with an equal thickness on each side, and not thin at one side and thick at the other. This requirement is said to be more easily met when the vessel is built bottom upwards, as the concrete can then be applied to the whole of the bottom with moulding-boards on the inside only, instead of having to be run in between boards on both sides. The vessels are not only built bottom upwards, but are also launched in this way. One would naturally expect that they would sink upon taking the water, but the deck is so arranged that enough air is imprisoned in the hull to float them, and by the admission of water at one side they are made to turn over. A sea-going lighter has already been built and

launched by this method with satisfactory results. This vessel took six weeks to build, but it is anticipated that the next one will be constructed in half the time.

#### SEA-WATER FOR MAKING BREAD.

One would reasonably suppose that many culinary operations involving the use of water and salt might equally well be carried out with clean sea-water. This, however, is only the case where a very small quantity of water is needed, or where the water is rejected after the cooking operations have been completed. For instance, sea-water for boiling potatoes is perfectly satisfactory, but it is far too salt for making Irish stew. French housewives situated within reach of the sea have long used sea-water for making bread, which does not become dry so quickly as when made with fresh water, this being the result of the magnesium chloride contained in the sea. Moreover, sea-water contains other mineral substances which are valuable in promoting health. The practice of making bread with sea-water has recently been advocated by M. Albert Saint Sernin, a French naval pharmacist, in the *Revue Scientifique*. This authority urged the reduction in the salt traffic which would result by the making of bread with sea-water in the coast towns; and in proof of the advantages from a health point of view, M. Sernin mentions a voyage of five months by a sailing-vessel in which one hundred and eighty-five passengers and crew were carried, during which bread made from sea-water was used exclusively, and no case of illness occurred on board. He further recommends the use of bread made with sea-water for growing children, convalescents, and all those who need to repair the waste due to fever or to hard labour. Preferably sea-water for making bread should be taken at some distance from the land, and from a depth of twenty feet. Fresh water must, however, be used for preparing the yeast, the salt water being added to the flour when the dough is mixed.

#### ARTIFICIAL WOOD MADE FROM STRAW.

Although various uses are found for straw in this country, it is mainly a waste product in the huge wheat-growing districts of Canada and other parts of the world. Consequently any process for transforming straw into a valuable product should prove of great advantage to such countries. This problem has recently been solved by a Frenchman named Carré, who has invented a process whereby straw can be converted into artificial wood. The straw is split lengthways by a cutter, which delivers it upon a travelling table, where certain binding materials are added, while heat is applied by steam, as in the process for making paper. The straw and binding materials are next subjected to a pressure of two to three tons per square inch in a hydraulic press. Various depths of the materials

are arranged on the table to give different thicknesses of the final product. In general appearance the material resembles American white wood, and it can be sawn, cut, or planed with wood-tools, while it does not easily split when nailed. Where large quantities of straw exist it can also be made up into briquettes for burning, and matches and the corrugated packing now made from strawboard can be readily made from it.

#### STANDARDISATION IN INDUSTRY.

As most of our readers are aware, fine wire-gauze is used in funnels and containers for petrol, one purpose being to strain out any foreign matter, and another to prevent fire from passing through into a container. At the outbreak of war much of this gauze was imported, and many different grades of fineness were used, according to the fancy of the manufacturers. As the result of a consultation between the Air Board and the leading manufacturers of wire-gauze, and of experiments at the Royal Aircraft Factory, a standard gauze has been agreed upon, which will much facilitate the manufacture. The gauze is to be known as the 'Air Board Standard Petrol Gauze.'

#### AIR-RAID DANGERS.

There has been much excitement and nervous apprehension among Londoners in regard to danger from air-raids, also such a variety of different advice as to seeking shelter in underground railway stations or other places, that an estimate of the risks—or, rather, small risks—Londoners run when comfortably sheltered in their own homes or other cover may be of interest, and will, it is hoped, convince the nervous ones that the risk, under those circumstances, is really exceedingly small—so small, indeed, that it may be described as a *quantité négligeable*. The fact that insurance companies are all eager to accept the risk at a merely nominal premium should be sufficient proof of this statement without further argument. However, figures, although dumb, are irrefutable. Suppose we take greater London as representing a space stretching 14 miles north to south, and 14 miles east to west; this will give us 196 square miles, or say, roughly, 200 square miles, covered to the extent of about one-half by bricks and mortar, and the remainder represented by parks, public and private gardens, rivers, canals, roads, open spaces, &c. Let us now divide the 200 square miles into square yards, and we get approximately 600,000,000 square yards. Taking every residential building and its garden to occupy an average space of 300 square yards (which is probably on the liberal side), and dividing this 300 into the 600,000,000, we get 2,000,000 spaces of 300 square yards, some with houses, and some without; so that Mrs Jones, who lives

in Hampstead, or Mrs Brown, in Ealing, stands 1 chance in 2,000,000 of getting a bomb on her house. If after a warning or during a raid the town-dweller is away from home, he may be well advised to get home as soon as possible. If there is any difficulty in this, then take cover anywhere, not necessarily in a Metropolitan Railway Station, which has great disadvantages. Where there is, of course, real danger is from falling fragments of our own shells, but if we are under cover there is very little cause for alarm.

#### MUSSELS FOR PEARL BUTTONS.

The raw material for making pearl buttons is largely taken from mussels, and in the United States the latter are obtained from the mussel-beds in the Mississippi and other rivers. These beds recently showed signs of becoming exhausted, and experimental work has been carried out by the Federal Bureau of Fisheries at the Fairport biological station with a view to restocking them artificially by breeding the mussels. The first investigation carried on concerned the propagation of the mussel, during which Mr George Le Fevre and Mr W. C. Curtis discovered that the young mussel could only come to maturity by attaching itself to the gills, fins, or tail of a fish. According to *Popular Science Siftings*, various members of the fish family were infected with the young mussels, or glochidia, and placed in ponds to await development, while two thousand eight hundred fish infected with over three hundred million glochidia were liberated. The fish and young mussels are placed together in tanks for a period of about half-an-hour, when the former are liberated. The glochidia bury themselves beneath the outer skin of the fish, and each fish of average size can carry one thousand to two thousand of these parasites without injury. In about a fortnight the young mussels come through the skin and fall to the bottom of the river, where they grow in the ordinary way. By these means the mussel-beds can be restocked in a period of three years, thus keeping up the supply of raw material for the manufacture of pearl buttons.

#### ABOLISHING KNIFE-EDGES IN WEIGHING-MACHINES.

It is essential that the beam in a pair of scales should move entirely without friction, and this result has hitherto been achieved by 'knife-edges' at the fulcrum. In the heaviest weighing-machines, however, knife-edges have not been found satisfactory, more particularly those for weighing railway wagons, which in the United States range up to a very big tonnage. The knife-edges in such machines very soon get out of order owing to heavy loads and rough usage. A recently invented device to overcome this difficulty is a thin flexible steel plate, which bends with the movement of the scale-beam.

Naturally the bending of these plates requires a certain amount of force, but the movement is so slight that the force required is practically negligible. Moreover, the movement always being the same, the force needed is compensated for when the scales are adjusted. A new weighing-machine has recently been constructed for weighing railway wagons on the Pennsylvania Railway, in which all the fulcrums consist of thin flexible steel plates. This machine is capable of dealing with weights up to one hundred and fifty tons, and by means of intermediate scale-beams between the main beam and the actual weighing beam, the adjustable weight of the latter is multiplied eight hundred times. Consequently the short arm of the weighing beam is pulled down with a force of only three hundred and seventy-five pounds when a weight of one hundred and fifty tons is on the weigh-bridge. This force is still further reduced by the ratio between the short arm and the long arm of the weighing beam. The latter is graduated up to three hundred thousand pounds at one-thousand-pound intervals, and a supplementary beam is marked in units of fifty pounds. The new system has received the sanction of the United States Bureau of Standards, which, in fact, has ordered a master-scale with flexible plate fulcrums. It is expected that weighing-machines with these fulcrums will retain their accuracy for very long periods.

#### POTASH FROM PRICKLY PEARS.

Attention has recently been drawn to the possibilities of obtaining potash in commercial quantities from the Australian prickly pear, and already the work is in progress at Dulacca, in Queensland. The prickly pear plants, as soon as they have finished bearing, are killed by spraying them with trichloride of arsenic. The dead plants are then burned in the open air and without any special precautions, and the ashes are found to contain 15 per cent. of potash. From five acres of the plant recently burned ten hundredweight of 80 per cent. carbonate of potash was obtained. Experiments have also been made in Mexico with the ash of prickly pear, cacti, and even sage-brush. It has been found that the Mexican prickly pear produces nearly 5 per cent. of ash when burned, and that this ash contains nearly 10 per cent. of oxide of potash, which is equal to a content of  $14\frac{1}{2}$  per cent. potassium carbonate. The plant, when alive, contains about 84 per cent. water, and from this and the above data it can be calculated out that the fresh green plant contains about 0.7 per cent. carbonate of potash, which works out at fifteen and a half pounds per acre of growing plant. When it is remembered that in Australia, in Mexico, in all Central America, and in parts of the United States there are millions of acres growing nothing but prickly pear, and that the yield, being annual, is in the nature of interest rather than a drawing out of

principal, as is the case with natural potash deposits, it would seem well worth while to exploit this source of supply at the present time. It is almost certain that all forms of cacti contain a high percentage of potash, and could be burned to make fertiliser.

#### THE PNEUMATIC MORTAR.

During the present war a number of devices and appliances long considered hopelessly obsolete have been revived in a slightly modified form. Among these is the pneumatic or compressed-air gun, which was in use so long ago as the time of Napoleon. According to the *Scientific American*, the French are now using a considerable number of trench-mortars in which compressed air or gas is used to propel the bomb into the enemy trenches. The operation of these mortars is very simple. A bomb is placed in the breech, and a puff of air or gas is admitted at a pressure of about one hundred and fifty pounds to the square inch. The air is drawn from a steel cylinder charged at the above pressure, which will provide a number of shots before the pressure falls low enough to be ineffective. These cylinders may be charged behind the lines and brought up ready for use, or they may be charged in the trench by a hand-pump. The puff of air is released by a trigger exactly as is the case in the ordinary mortar. Compressed-air mortars, although having longer barrels than the explosive type, are very much lighter. They can be worked quickly, and at a low cost. Moreover, the results with them are very accurate, the bombs falling exactly where intended.

#### OIL-SUPPLIES FOR THE EMPIRE.

An enlightened member of Parliament has said that oil is probably more important than anything else. You may have men, munitions, and money, but if you have not got oil all other advantages will be of comparatively little value. We require fuel oil for the naval and the mercantile fleet, and in some cases for locomotives; benzine for motor transport and aeroplanes, for lubrication, and incidentally for the manufacture of explosives. This makes the report of the Anglo-Persian Oil Company of more than usual interest. We learn from it that our Government holds a million and a half of the shares. The capital of the concern has been recently increased to five millions sterling. Von Tirpitz, more honest than many of his compatriots, has acknowledged that Germany must recognise that Britain had won more in the war than she had lost. 'Not only has England taken our colonies and Mesopotamia, but everywhere she has made deeper and firmer bases for her maritime and colonial supremacy.' Of such is this Anglo-Persian Oil Company, which owes its existence to the enterprise and foresightedness of the late William Knox D'Arcy, the son of a Devonshire

gentleman, who went to Queensland, where he followed legal, pastoral, and mining pursuits from 1866 to 1889, returning to England in the latter year. He was a large-hearted man of great integrity. The Anglo-Persian oilfields are among the most extensive and prolific in the world, and it is regarded as possible that in the near future Persia may one day be as big an oil-producer as the United States. One field has the capacity of yielding four million tons of crude oil annually, and a well which has already produced over one million seven hundred and fifty thousand tons of oil continues to produce as freely as ever. The whole yield is now larger than the pre-war produce of the Roumanian and Galician oilfields. One of the latest contracts is to supply the Indian Government with oil, which is to be used instead of coal on western Indian railways. This is the result of a long series of trial runs and experiments, which demonstrated the greater efficiency and economy of oil.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

#### GRANDMOTHER'S LETTERS.

Draw them gently from their hiding,  
Echoes of a bygone day.  
How their faint, sweet perfume lingers  
Like a half-forgotten lay!  
Dust, long since, the hands that pen'd them,  
Yet these fragile records stay.

How they conjure up old faces  
Lost in swiftly passing years,  
Memories of joys and sorrows,  
Vanished hopes, forgotten fears!  
Still their music haunts and vibrates,  
Moves to smiles and melts to tears.

Touch them softly, faded tokens  
Of a friendship left behind  
When the world had time for loving  
And for being just and kind,  
When war's horrors did not darken  
All the light of heart and mind.

Put them back, mute, tender relics  
Of a sweet and tranquil past  
(Mark the polished, stately phrases  
Writ to bind affection fast).  
Lay them by again, and fondly  
Fragrant rose-leaves on them cast.

BARBARA PENSON

#### \* \* TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

### THE MAN WHO SCOFFED.

By ARTHUR BEVERLEY BAXTER.

#### PART I.

DENNIS MONTAGUE emerged from his bath, glowing and talkative. A luxurious deep-blue dressing-gown was wrapped about his form, the colour in it accentuating the gray-blue of his eyes and his light-brown hair. His valet stood beside his bed, on which reposed a complete and expensive set of garments suitable for a gentleman bent on spending his evening out.

'Ah, Sylvester! that's right. We poor devils of men must look as well as the abominable fashions will permit. What is the time?'

'Gone past seven, sir.'

'Dear me, I shall be late! I am always late, Sylvester. It partly accounts for my extraordinary popularity. A hostess is so relieved to see me by the time I turn up at her dinner-party that for years afterwards she always associates my face with pleasant sensations. Any mail, Sylvester?'

His servant crossed to the table, on which there reposed four letters. 'These came in this afternoon, sir.'

'Read them to me while I dress.'

'Read them, Mr Montague?' The valet's face was a study of respectful expostulation.

'Is the idea so preposterous, my dear fellow? I believe most people write letters with the idea of having them read.'

The decorous Sylvester sighed, and broke the seal of the first letter. "I would beg to remind you," he read, "that your account"—

Montague made a deprecatory gesture. 'How polite these trades-people are!' he said. 'I shall expect one some day to enclose forget-me-nots. The next letter?'

Sylvester solemnly opened a diminutive envelope. "'Mrs W. De-Ponsy Harris requests the pleasure'"——

'Another request! What is it—a tea or a dance?'

'A dinner, sir.'

'Good! I shall go. Mrs Harris is the worst hostess in the city, but she keeps the best cook. Proceed.'

The worthy Sylvester took from the table a delicately scented letter that breathed its delightful suggestion of romance to his grateful nostrils, whereupon he promptly blushed a deep, unlovely,

No. 375.—VOL. VIII.

tomato-like red. 'It starts,' said he, "'My Dearest Love'"——

His master glanced at him. 'Don't blush,' he said. 'The *grande passion* is nothing to be ashamed of.' He carefully adjusted his tie. 'What is the young lady's name?'

'Myrtle, sir.'

'Ah yes; poor little Myrtle! What a pity a woman clings to a romance that is dead! There is something morbid in women that makes them do it. It is like embracing a corpse.'

'Shall I read it, sir?'

'No, no; don't bother. I know what is in it. On the third page she declares she hates me, and on the fifth page she denies it. Myrtle runs so deucedly to form.'

A look of relief crossed the rotund countenance of Mr Sylvester as he took up the last letter. 'It's from a society for educating the poor, sir.'

'Tear it up. What we need is a society for educating the rich.' Completely dressed, he turned around and struck an attitude. 'It is my intention some day,' he said with grandiloquent airiness, 'to found a *Conservatoire Universale*, where philanthropists will be taught charity, ministers of the gospel will gain humility, musicians will learn to feel, and newspaper writers will take up the elements of language. Heavens! such a scope as I should have! Stick your head out of the window and see if a taxi is waiting.'

Sylvester raised the window and surveyed the street below. 'It's there, sir,' he said, drawing his head in.

'Then I shall leave you. Mrs Le Roy is giving a dinner-party this evening, and she invariably has guests who listen charmingly. Good-night, Sylvester.'

'Good-night, sir.'

When he was gone, William Sylvester scratched his thinly covered head. He then shrugged his shoulders, and followed these actions by pouring out a glass of sherry. He took a sip. 'Eavens!' he said aloud; 'ow 'e do talk!'

Dennis Montague of Toronto, Canada, was twenty-eight years of age, and had an income

[All Rights Reserved.]

FEBRUARY 2, 1918.

which made consistent toil unnecessary. To be true, he wrote for one or two magazines and dabbled with law in a desultory manner, having been called to the bar some four years previous. But he remained an utter stranger to work, and loved luxury with the sensuous delight of an Eastern houri. The present was delightful, and the future was simply the present carried on. When, on this particular evening, however, his taxi stopped at the home of Mrs Le Roy, it left him at the place where his whole life was to be altered in a single evening.

After his usual apologies for tardiness, he led Mrs Le Roy in to dinner, and in five minutes his wit and repartee were dominating the entire party. Whether or not his brain was gold, Montague always glittered, and people love things that glitter.

After dinner they danced. Mrs Le Roy was not a gifted hostess, but she acted on the principle that food, wine, and music—providing the food and wine were high-class, and the music was not—would make any evening a success. Few of her guests disagreed with her; their feet and tongues were light, and they danced and talked without self-consciousness or mental effort.

It was nearly twelve o'clock when Dennis Montague led Vera Dalton into a moonlit recess of the conservatory. 'What a night!' he said, as they stood together surveying the silver glints of the moonlight upon the lawn outside. The girl was silent, but a lifting cloud caused a ray of light to mingle with her hair. Montague turned towards her, his eyes brilliant and his face flushed. He took her hands in his and drew her towards him.

'Don't,' she said quietly.

'Women always say don't,' he replied. 'I suppose they like to have a preliminary *tête-à-tête* with their conscience before they commit an indiscretion.'

'But I mean it, Dennis.'

'All women mean it, Vera.'

'Please let go of my hands.'

'If you pay the price.'

'And you call yourself a gentleman, don't you?'

'I have a valet and three addresses.'

The girl bit her lip, and then looked quickly up as though she would read into his very soul.

'Why,' she said hesitatingly—'why do you want to kiss me?'

Montague smiled. 'The eternal question, my dear. It has trapped more men into proposals than all the wiles of a generation of fond mothers.'

'But you don't love me,' she said searchingly, questioningly, utterly ignoring his flippant sarcasm.

'On such a night as this,' he answered, 'who could help but love you?'

The girl tried to free herself, but his grip held her.

'Dennis—I mean it—I shall call for help.'

His brow contracted with a sudden frown. 'You come here,' he said, 'at midnight—into a deserted conservatory . . . with me. Then because I do what you knew from the first I would do, you suddenly decide to play "Little Miss Prude from the convent."'

'I did not want to come here, Dennis,' she said slowly, hesitatingly. 'I fought against it. I—I had to come.'

A light of conquest crept into his eyes. This was a charming surrender. He drew her to him with a swift encircling movement of his arms.

'I have admitted, Dennis Montague,' she said breathlessly, 'that I came here because you fascinated me. It's true; you have always fascinated me. But I tell you that down in my heart I loathe you, detest you, for the coward that you are.' Montague drew back as though fired upon by a masked battery. 'In all the years I've known you,' she went on furiously, as though fearing that her courage would leave her before the finish, 'you have done nothing that was not selfish, mean, and cowardly—above everything else, cowardly. Look at the girls you have known'—Montague interrupted her with a furious gesture, but she went on: 'More than a dozen I could name have given you the depth and sweetness of their first love, inspired by you, called forth by you. Do you realise what a woman's heart is and what she gives you with it? And you—you are too cowardly to face marriage, too cowardly to love with your own heart—too selfish to leave women's hearts alone.'

Montague took a cigarette-case from his pocket. 'May I smoke?' he said coolly.

'You are a coward about your profession as well,' she hurried on, ignoring his interruption. 'Your mother, I know, had great dreams for you. She planned, worked, sacrificed for you. Yet you are too much of a coward to face competition with what you choose to call "the little legal minds of the city."'

'And thirdly?' he said, lighting a cigarette.

'Yes, thirdly,' she said desperately, although his easy nonchalance was fast undermining her courage, 'you are not in the army. Yet no one could say that Dennis Montague is not fit. I can only presume, like every one else, that you are afraid.'

'And lastly?' He was still calm, although keener eyes than hers would have noticed a dark, ominous flush under his eyes.

'And, lastly,' she said, unconsciously repeating his formula, 'you scoff at everything that is good and pure, sneering at religion, and drawing yourself aside from your fellow-creatures as though they were loathsome. Yet I say to you, Dennis, that there is not a man in the slums whose soul

isn't far, far richer than yours. It is only a coward, afraid to face the real things, who scoffs at life.'

Weak from the effort she had made, her voice tumbled into silence and a cold sweat broke out on her brow and the palms of her hands.

'Will you smoke, Vera?'

'No, thanks,' she answered faintly.

'Do. It would soothe you.'

'No, I thank you.' She repressed a sudden desire to fly from the conservatory. She had become suddenly afraid of the cool, smiling figure beside her.

'As far as girls are concerned,' he said quietly, replacing the cigarette-case in his pocket, 'just as long as they angle for us with every artifice of dress and rouge and coquetry, so long will they catch us and the consequences. As for the law, which my mother planned for me, I regret that my father left me the instincts of a gentleman, not an attorney. I am not bothering you?'

'No, no. Go on.'

'As for the army, I don't happen to be interested in the war. I disapprove of the crudeness of our Canadian civilisation. I disapprove of England's lack of the artistic. I disapprove of German militarism, Scotch bagpipes, Swiss cheese, Chinese laundries, and American politics. Why should I fight for one when I disapprove of them all? As for my fellow-man, I dislike the ordinary man of the streets because he does not think, read, or bath often enough. I am not hostile to him; I merely ignore him. I am not a coward at all, my dear Vera; I am merely an artist among artisans.'

With a graceful movement he offered his arm to her. 'Let us return to the dancing,' he said.

With a frightened, inquiring glance, she took his arm, and without a word they left the conservatory. At the door of the ballroom they paused, and she laid a timid hand on his arm. It will ever be a mystery to men how women can love and despise the same object.

'Dennis,' she said, 'will you try to forget what I have said?' Her courage had gone, fled before his coolness and the fascination he held for her, though she had striven with all her womanhood to free herself from it.

'I wish to Heaven I could,' he said grimly.

The morning sunshine invaded the rooms of Dennis Montague with pervading cheeriness. It was nearing the end of April, and a hundred birds sang of the wonders they had seen during the winter, of arid Africa, of the witcheries of the Nile, where they had seen Pygmies at war with the butterflies, and had heard the great god Memnon raise his mighty shout to greet the dawn of day.

Oblivious to the sunshine and everything but his thoughts, Montague lay in bed the following morning, and sought to wrestle with the truth he had heard the night before. It was impossible to dismiss the thing from his mind. His brain throbbed with resentment, questioning, searching her words—striving to convince himself that her charge of cowardice was the vituperation of an unrequited love. But it was useless. He could explain her actions, dissect her motives, applaud his own pose, but he could not eliminate the feeling of personal nausea which clung to him, as though he had suddenly sickened of his whole nature.

A knock at the door interrupted the thread of his thoughts, and his valet entered with a tray of breakfast-things.

'Good-morning, sir.' Sylvester carefully arranged the tray on a little table beside the bed. 'It's a beautiful morning, sir, and I see by the paper that the 'Uns are giving the Canadians a rough time of it, what with gas and what not.'

His master gazed listlessly at the breakfast-things. 'Sylvester,' he said quietly, 'for years you have ministered to my body. What can you do for a soul that is starving?'

The valet beamed reassuringly. 'That's halright, sir.' He rubbed his hands in genial encouragement. 'A bromo-seltzer will fix you up.'

A large and varied experience as a servant to young gentlemen had inured him to morning-after reproaches.

The sound of a military band drew Sylvester to the window. 'Ow, look!' he cried, his natural decorum suddenly dispelled by the inspiring sounds of the music. 'There must be blooming near a thousand of them. Seems like 'ome, it does, when the Guards used to do London in all their swankin' regimentals.'

A battalion swung past in steady rhythmical tread to the stirring strains of the Welsh hymn of freedom, 'Men of Harlech'—a splendid body of men with their chests expanded, arms swinging freely, and their whole bearing one of vigorous, unconquerable manhood. The last man passed, and the music ceased as suddenly as it had come. The birds resumed their chorus, and William Sylvester reinvested himself in his imperturbable mask of deference. Languidly Montague rose from his bed and lit a cigarette.

'Our civilisation,' he said quietly, 'need not pride itself on raising these men. Men have always been brave since they were men. The terrible failure of our times is that it has produced men like me—a coward.'

The valet scratched his head. 'You ain't a coward, sir,' he ventured. 'Lor' bless me! I've seen you ride a buckin' mare that'—

His master turned on him with a vehemence that his valet had never before seen in him. 'I tell you I am a coward,' he said fiercely. 'Don't I know that my place is with these men?'

In that battalion that passed there are married men with families, there are only sons of widows, there are brothers, sweethearts. Who is there to care if I go? My death would not cause a single tear; and yet I stay, not that I am afraid of bullets or death, but because I know that I shall have to sleep beside men who are filthy, unclean, and because I shall grow filthy too. I detest it. I abhor it, and yet I stand aside and let others go.'

'You—you are a gentleman, sir.'

'A gentleman!' He burst into a rasping laugh. 'My own definition last night was, "A man with a valet and three addresses." What a fool I was! No, I am not a gentleman. I've never been one. The greatest gentleman of all time was a carpenter. That is the truth I have to burn into my soul.'

A perplexed and troubled look spread over the vastness of Mr Sylvester's countenance. This was a new phenomenon to him. He was frankly puzzled, and reached for the breakfast tray with a melancholy slowness of movement that quite inadequately expressed his inward perturbation.

A cool shower and a shave having failed to dispel the brooding mood that had fallen on him, Montague hastily dressed himself, telling his servant he would not return before dinner. Clothed in an immaculate gray suit, with a velours fedora and a walking-stick, he strode into the street, a handsome, striking figure of a man, whose lithe athletic figure spoke of vigorous strength, a strength devoted to sporting activities, but a stranger to toil.

## WHERE DIFFERENCES COUNT.

By W. V. ROBERTS.

IF one set out to write a book on things not generally known, he might find material for a very considerable chapter in the differences in tradition, custom, and form which mark the ordinary procedure of one House of the British Legislature as compared with the other, but which nevertheless almost entirely escape public notice. Yet some of these traditions are deeply cherished by members themselves. Some are not without importance, and nearly all have great historic meaning.

Take, for example, a few of those that cluster round the office of Speaker in either House. In the House of Commons the Speaker is always elected by vote of the members, and during his term of service he is above all party, while usually he may continue in office as long as he feels able to bear its burdens. On the other hand, the members of the House of Lords have no voice in the selection of the Lord Chancellor, who acts as their Speaker; for the Lord Chancellor owes his appointment to the Prime Minister, and goes out of office with the Ministry. Again, the Speaker of the House of Commons never takes part in debate, though he may, of course, give his decision on points of order and on all matters that pertain to order; whereas the Lord Chancellor is a frequent speaker in the House of Lords. In the House of Commons, members in debate always address the Speaker, and it is a gross breach of propriety for any one to pass between the member who may be speaking and the Chair; but in the House of Lords the practice is reversed, as each speaker addresses, not the Lord Chancellor, or the Chair, but his fellow-peers. Tradition also prescribes that in the House of Commons the Speaker should not vote in any of the numerous divisions that take place, though in the rare event of a tie he may

give a casting vote; contrariwise, the Lord Chancellor may vote like other peers in the House of Lords, but has no casting vote, the rule being that should a tie occur the 'Not contents' have it, so that the motion falls to the ground. Curiously enough, also, in the Lords, the peers who vote are counted as 'Content' or 'Not content'; in the Commons the members vote 'Aye' or 'No.'

Further, in the House of Commons it is the Speaker who calls upon the members to speak, and the effort to catch the Speaker's eye is among the standing humours of parliamentary life; but in the House of Lords it is not the Lord Chancellor but the peers themselves who may decide should there be a competition between two would-be speakers determined not to give way. Other differences are equally notable. Whoever, for instance, is appointed to the office of Lord Chancellor is immediately made a peer, so that he may take his seat upon the Woolsack and act as Speaker of the House of Lords; a peerage is just as invariably conferred upon whoever is chosen to act as Speaker in the House of Commons, but in his case it is necessarily deferred till he lays down the duties of office, when, there being little further distinction to offer in the Lower House, he passes almost as a matter of course to the House of Lords. On the same line there is also this difference to be noted, that a new Lord Chancellor enters the House of Lords to preside forthwith over its deliberations, while a member of the House of Commons is seldom chosen to act as Speaker of that assembly until he has had years of experience as a member and shown that he has special qualifications for the post. It is often supposed that the Lord Chancellor, with 'a round ten thousand pounds a year,' is more

highly paid than the Speaker of the House of Commons. But there again there are differences that should be explained. For many years the emoluments of the Speaker of the House of Commons have been five thousand pounds a year and an official residence, with a pension of four thousand pounds a year on retirement, and a peerage. As compared with that, the Lord Chancellor has received four thousand pounds a year for acting as Speaker of the House of Lords, and a further six thousand a year, the salary of a Lord of Appeal, is assigned to him for presiding over the judicial proceedings of the House; and it was not till the beginning of 1917 that an agreement was made whereby he was allowed as an official residence the house formerly occupied by the Clerk of the Parliaments.

In other directions also curious distinctions may be found. An Irish peer, for example, may be chosen to sit in the House of Commons for any constituency outside Ireland, and Earl Winterton, an Irish peer, has for more than thirteen years been member of Parliament for the Horsham Division of Sussex; but, on the other hand, no Scotch peer may be elected for any constituency. Peers of the United Kingdom, of course, have seats in the House of Lords, and peerages of the United Kingdom are frequently conferred on Scotch and Irish peers. Thus it comes about that a Scotch or an Irish earl may receive only a United Kingdom barony, with the result that he sits in the House of Lords as a baron, although outside his title of earl is always used by courtesy. The case of Earl Curzon is almost unique. First, in 1898, he was created an Irish peer, which gave him the title of Lord Curzon, while Viceroy of India; then in 1908 he was chosen as one of the Irish representative peers, which gave him a seat in the House of Lords; in 1911 he was created an earl of the United Kingdom, and as an earl he sits and votes in the House of Lords, although, as Irish representative peers are elected for life, he remains an Irish representative peer also.

In matters affecting the Church and the two Houses there are various rules and traditions. There are nearly forty bishops in the Church of England to-day, but only the two archbishops and twenty-four bishops may sit in the House of Lords at one time, most of the bishops entering in order of seniority of consecration as vacancies occur. But as against that, no clergyman of the Church of England may sit in the House of Commons unless he first allows himself to be unfrocked. Should, however, a clergyman of the Church of England succeed to a title in the peerage, he may at once, as a peer, take a seat in the House of Lords; and there are now at least three clerical peers in that House—the Earl of Strafford, who was at one time chaplain to the Speaker of the House of Commons, Lord Byron, and Lord Thurlow. While, however, clergy of the Church of England may not enter

the House of Commons, Nonconformist ministers of any denomination may do so. The late Rev. C. Silvester Horne, for instance, was member of Parliament for Ipswich while in charge of Whitefield's Tabernacle, Tottenham Court Road, London; and the Rev. Towyn Jones, formerly a Congregational minister in Wales, is now not only a member of Parliament, but a member of the Government as Junior Lord of the Treasury.

Among the men of law the distinctions as between Lords and Commons are equally clear. Should a member of Parliament be made a judge, he must, of course, leave the House of Commons, but does not enter the House of Lords, unless appointed to one of the higher posts, such as that of Lord Chief-Justice, Master of the Rolls, or Lord of Appeal, with the added dignity of a peerage. That he should be addressed in court as 'My Lord' does not imply connection with the peerage. But should he succeed to the peerage he may act both as a peer and a judge. Lord Coleridge, succeeding to the barony first bestowed on his father, is now both a peer of the realm and a judge of the King's Bench Division; and Lord Ilkeston, succeeding to his father's barony, is both a peer and stipendiary magistrate for Birmingham. While a judge may not sit in the House of Commons, a recorder may do so, though he must seek the approval of his constituents by submitting himself for re-election. Curiously enough, although judges are often appointed from among members of the House of Commons, and seldom from among the peers, the House of Commons does not exercise the judicial authority entrusted to the Lords, who sit as the final Court of Appeal, that court consisting of the Lord Chancellor and six Lords of Appeal, with such peers of Parliament as hold or have held high judicial office.

But that by no means exhausts the differences that mark tradition in the two Houses. The number of members of each House is now much the same—six hundred and seventy in the Commons, and six hundred and eighty-six in the Lords; yet forty members are needed to form a quorum in the House of Commons, and only thirty in the House of Lords. The Lords are not paid for their legislative work; but members of the House of Commons are paid four hundred pounds a year each; and the members of the House of Commons now included in the Government outnumber the peers in the Government by about three to one, so that the emoluments of the commoners are considerably more than those of the peers. Financially there is another distinction. Should a member of the House of Commons become bankrupt his seat in due course falls vacant; but peers who become bankrupt, or in Scotland have their estates sequestrated, are simply disqualified from sitting or voting till after a discharge is obtained or bankruptcy is annulled. In any event, a member of the House

of Commons is chosen for the Parliament only, and has to seek re-election at each dissolution; a peerage of the United Kingdom carries a seat in the House of Lords for life, with reversion to the eldest son or other heir.

In matters of legislation also there are differences that always count. Thus a money bill, or a bill imposing taxation, must always 'originate,' as it is termed, in the House of Commons, that being one of the most important distinctions in the whole series here spoken of. By way of balance, bills relating to such subjects as restitution in blood or honour or 'pains and penalties,' originate in the House of Lords, custom in these last-mentioned matters being traced back to a time when the Commons had not the power enjoyed by the Lords of examining witnesses on oath. As there is a difference in originating bills, so also there is a difference in treatment when they have passed both Houses. An ordinary bill so passed remains with the Lords till the royal assent is given to it, but a bill of supply is sent back by the Lords to the Commons for presentation by the Speaker at the bar to the sovereign, or the Royal Commissioners, for the royal assent—a custom that

further marks the power of the House of Commons over the purse.

Even when the royal assent is given there is a difference in form. A bill of supply takes precedence, and the royal assent to it is in these terms: '*Le roy remercie ses bons sujets, accepte leur benevolence, et ainsi le veut.*' To a general bill the royal assent is given in the simple words, '*Le roy le veut.*,' while to a private bill it takes this form: '*Soit fait comme il est désiré.*'

Such are a few of the distinctions that attend the course of legislative procedure from year to year. Possibly some of them may seem trivial, but it may be gathered from what has been said that all have grown with time. It may have been noticed, for instance, that the royal assent is still declared in Norman-French. Others are but as symbols of issues long since dead. But whether as symbols of the past or as active rules of to-day, they are cherished in the House which they specially concern, for nothing is so dear as precedent to Parliament men. That traditions should count for so much makes it worth while to know them, and to understand their import in modern usage.

## THE FORESTER'S GIRL.

By Mrs W. F. IRVINE BELL, Author of *John Pardon's Choice*, *Ole Cam'ron*, &c.

### CHAPTER IX.

THE long letter Anita wrote to her lover that morning of her first venture alone into the forest was destined never to reach him, and this notwithstanding that, contrary to Charlie's prediction, a party of campers *en route* for the lake-fishing passed through the Grizzly the next day, and gladly undertook to carry mail and parcels to all the scattered dwellers along the mountain road. Not that the forester was again left wholly without a message from his 'girl.' It was a very sweet, very tender little scented note which his eager fingers extracted from the letter-box on the evening of Nat Duncan's ministrations as barber.

It began, 'Dearest Dave,' and ended, 'Your own Annie;,' the possessive adjective doubly underscored, and no mention from first to last of the Englishman.

As he read it David's face cleared. Nat was a fool, and himself another—a scoundrel he felt himself to be for nursing unworthy thoughts of that sweet girl. It was all his nasty, jealous temper cropping out again. A wretched life he would lead poor little Annie (his thoughts ran on in a contrite passion of self-arraignment) if he let it get the better of him whenever she looked at some other man. Still, it *was* odd. He re-read the note. Perhaps that might be the very reason she had avoided any mention

of her travelling-companion. David shook himself angrily in supreme self-disgust.

'If you're *that* kind of a chap, David Benedict Hardy,' he argued with himself, 'you'd just best not marry at *all*—leastways not a sweet, sensitive, loving little soul like Anita Lalonne. You'd break her heart with your beastly suspicious ways of lookin' at things!'

Filled with compunction, David pressed the little letter to his lips; sniffed at the delicate fragrance that reminded him so vividly of the writer; took her photograph from the pocket in which it always reposed, feasted his passionate eyes on the great, soft ones looking back so candidly into his own; then, with the last trace of the thunder-cloud banished from his brow, he set to work on his usual routine of bachelor housekeeping, a cheery whistle on his lips.

Thus it happened that at the very moment when the flame of a kindling newspaper in the forester's stove was dyeing his rugged countenance crimson and yellow, a tiny ball of crumpled, closely written pages was darting pinky tongues of colour and pencilling soft shadows on the smooth, round cheeks of his 'girl,' crouching over a diminutive bonfire of cones and twigs in front of her hut at the Grizzly Station. For Anita Lalonne had that day reached a doubtful place on the trail of her new life, and, like many

a one before her, had taken a wrong turning, ignorant of the bogs and boulders towards which it might lead her.

The girl truly loved her forester; so it was with deep distress, mingled with contrition, that after the hurried midday meal she had shut herself up in her room, and there, picturing David's disappointment when no letter reached him, had taxed herself severely for neglect of him. The poor child was, at most, guilty of the very pardonable sin of losing note of the flight of time in the enjoyment of a congenial companion; but that which gave poignancy to her self-reproach was the disquieting knowledge that in the society of this other man not only had David been quite forgotten, but she had felt more exhilarated and more in her element than ever she had done in the company of her American fiancé. Thus troubled and dissatisfied, Anita took from her dress the unposted letter, smeared and creased from careless handling, and glancing through it, became uncomfortably conscious of the oft-recurring words 'Englishman' and 'Mr Barrie.' Written as they were in all innocence, Anita suddenly caught herself wondering as to how David Hardy might regard this prominence of a stranger in her first letter to him on the threshold of their married life. That her lover was intensely jealous she had, by experience, already long since learned, and although to a certain extent this was pleasing enough to her feminine vanity, she had on occasion found it extremely irksome, and an open quarrel had been averted solely by her own sweet, well-controlled temper and readiness to fall in with David's wishes. Even to see her fondle a kitten had seemed to vex him; and when one time, in a sudden gush of pleasure over a beautiful young dog, she had kissed the smooth, satiny muzzle, David had quite frightened her by his stern bidding 'never again to do such a thing in his sight,' and had even made show of refusing to allow her red lips to touch his own until she had promised that in future none but himself should know their pressure.

As all this surged through Anita's mind, while with paling cheeks and tearful eyes she sat perched on her bed, the letter in her listless hands, there came the sound of hurrying feet, a sharp knock on the door, followed by the voice of the genial Charlie crying out, 'Oh, Mees Lalonne! I say, Mees Lalonne! Dere's come a party of campers goin' up to de lakes. Dey'll take your letter to Dave Hardy!' And, as Anita hastily opened the door, 'Eh? What? Bin cryin'?' Why, dot's all right, Mees Lalonne. You just gimme de letter, an' Dave'll have it to-morrow evenin'. Dese folk are goin' as far as Rainbow, an' dot's a good bit de furdur side of de Laughin'.'

Charlie stood smiling up at her kindly and holding out his hand for the letter.

'Oh, Mr Axel,' stammered Anita, 'would the

people—oh, won't they *please* wait just a few minutes? The letter—I—I want to add a postscript!'

'Yah, yah; I understand, Mees Lalonne,' laughed Charlie. 'Dey're awful nice people—*awful* nice. Guess *dey* know what lovers is like! I'll tell 'em, and dey'll wait all right. Only, you'd better be quick, 'cause dey've a long way to go to de first campin'-ground before night.'

'Yes, yes; I'll be as quick as possible,' replied Anita eagerly. 'Thank you so much, Mr Axel!' Then, as the man walked away, she flew to her bed and snatched up her letter. Suddenly she crumpled it in both tiny hands. 'I'll write him another!' she cried, and dragging from her trunk some dainty note-paper, scribbled the few lines that were to bring such happiness and consolation to her sweetheart. 'There!' she exclaimed, hurriedly imprinting several kisses on the pages and sealing the envelope; 'that's much better. I can tell him all the rest by-and-by.'

Then, with a lighter heart and the dimples again playing hide-and-seek about the red ribbon of her lips, she ran down the steps, and soon had the satisfaction of seeing the campers, with their precious burden of mail for the in-dwellers of the forest wilds, rattle out of the station-yard.

It was not until the following evening that a draught from the open door sent the ill-shaped paper ball rolling to her feet from under the bed where it had fallen, and Anita, not caring to leave it blowing about, ran out with candle and matches, and heaping together a miniature pyre, cremated the pages wherein Gavin Barrie's name figured so conspicuously, and with the toe of her childish boot rubbed the soft gray ashes into the rich forest loam.

In the meantime that mischievous little god—Chance yclept—whom oftwhiles even the most faithful of us are sorely perplexed to differentiate from 'the divinity that shapes our ends,' had busily continued forging the fine links of a chain wherewith to shackle this man and woman whose lives, according to the natural course of things, should have remained as far asunder as the Poles. Had not a wild west wind nearly exterminated beneath a torn-up tree a certain forester; had not Charlie Axel's clumsy horse trampled on Gavin Barrie's foot; last, but not least, had not Kenneth Grey inherited from a long line of medicoes the conscience that suffered neither rest nor pleasure to deter him from daily attendance upon his feverish little patient at Silver Creek, the fellow-passengers in Charlie's outfit would, in all likelihood, have travelled together not a yard farther than Grizzly Station. But granted all these trivial circumstances, which inevitably threw together two young people of magnetic personalities and strong mutual interests, and who shall say but that they were bound to tread at least a Sabbath-day's journey: the self-same trail?

The latter half of each day found the two Englishmen absorbed in the comfortable, quasi-busy-lazy fashion peculiar to young men on a holiday, killing time with all diligence, taking to pieces and cleaning guns already spotlessly clean, unreeling endless yards of lines to reel them up again, comparing flies a hundred times compared, discussing details of a prospective camping trip, visiting the salt-lick and bear-trap, or merely sitting in one or other of their tent-doors, smoking in happy silence, broken only by the satisfied snores of the red-brown dog.

The morning hours, however, when Kenneth Grey's mission of mercy took him away from breakfast until dinner, left Gavin, his game-foot still obstinately painful, and the solitary girl in sole possession of the station. The unwontedly early hour of rising, too, with its exhilarating freshness, and the allurements of dewy, fragrant woods to wander abroad before the heat of the day, all conduced to the same end; and as Barrie's moccasined foot and Anita's timidity tended respectively to limit their rambles, the two were constantly running across each other in what Anita called their *petits voyages*.

That these *rencontres* with the pretty, lively girl should have been other than agreeable to the young man would have been scarcely human; and although her frankly appealing '*Où allez-vous maintenant, monsieur? May I come too?*' evoked nothing more enthusiastic than a brief 'Yes, if you like,' his tongue was soon limbered up, and the slow, reluctant English speech gave way to a ready flow of the language which was the natural exponent of his second self.

As for Anita, her fears of the wilderness being, thanks to his influence and companionship, steadily overcome, she was full of pretty eagerness to learn all that he could tell her of bird and beast, of tree and flower, so that their talk increasingly turned on the immediate present; and as Gavin made no sign of having guessed her identity, the girl became less and less inclined to reveal it—nay, rather on guard not to do so. After all, what did it matter? So she reasoned with herself. All that part of her life—how unreal and remote it now seemed! She, an obscure little school-teacher in an insignificant Californian town, the bride-to-be of a plain, self-made man; and he, this tall, handsome Englishman of the grave eyes and grand air, whom the strangest of chances had again thrown across her path. All things considered, she reflected, it was doubtless far better that the long letter to David had not been despatched; the Englishman could not interest him, and that chapter of her life in which he had played so large a part lay so wide of the forester's own experience that he could neither sympathise nor understand.

Mr Barrie, too—evidently her very appearance must have faded from his mind; while she—yes, in the innermost temple of her heart he was

enshrined, and worshipped there not as mortal lover, but as some hero-god far above her, and beyond the dreams of human desires. It was this childish deification of a perfectly normal, matter-of-fact young Englishman that had at first made it difficult for Anita, after a lapse of several years, to recognise in her fellow-traveller of the prosaic dust-coat, and surrounded by the commonplace contents of Charlie Axel's wagon, the fair young god of her visions.

That her own identity might, by the wholly different circumstances of her dress and environment, be equally obscured never crossed her mind. Nor did she once reflect that if the wide, wide world had swallowed beyond her ken this man whose memory was so dear and sacred, no less so did it apply to her own case, and that in the over-smartly-dressed young woman, represented to him by Charlie as a schoolmistress on her way to marry a forester of the National Reserve, Gavin Barrie could not reasonably be expected to recognise her. Great, therefore, would have been her surprise had there been visible to her, just at the time that the forester was delighting over his sweetheart's missive, and she herself destroying the ill-fated letter, a little scene occurring within the neighbouring tent.

The two friends, Barrie and Grey, having smoked their final pipe together and parted for the night, the former, closing the tent-flap and pulling forward his portmanteau, began emptying the contents on the floor. From the very bottom he finally lifted a small, flat parcel, and unwrapping it, held at arm's length, and in such a position that the full light of the candle fell upon it, a sketch in pastel, of rare delicacy as to line and colour, on the back of which was roughly written in pencil: '*Les Cérises*.'

'Ah!' exclaimed Barrie in a low tone of suppressed excitement. '*Of course it is! What a blind fool she must think me—unless*'—

This way and that he turned the sketch, scanning critically the contour and every feature of a delicately poised head, with bare throat and shoulders, the draperies about which were vaguely indicated in filmy blue. It was that of a young girl—a child as yet—her abundant black hair cut short and lying in thick, loose waves about the nape of her neck, about the small, shell-like ears and low, white forehead, the whole face seeming to serve merely as a setting for a pair of enormous black-brown eyes. But that which caught and held one's attention was neither the hair nor eyes, not even the classic shapeliness of the head daintily erect on a lily-stem of pure white throat; it was the lips—full, ripe, crimson lips, like unto a true lovers' knot of brightest ribbon. Other colour there was none, save where, in a corner of the sketch, the artist had, as it were, dropped from his brush a triplet twig of ripe, red cherries.

(Continued on page 163.)

## RAILWAY REFORM.

## LARGE WAGONS: THEIR UTILITY AND ECONOMY.

By JOHN ORR.

**SOME** years ago—a good many now—all eyes were turned towards America, where, with characteristic enterprise, the Americans had equipped their practically new railways with everything that applied science and ingenuity could suggest, with results entirely satisfactory to themselves—quick service and economical working, the perfection of railway management. It is just possible, however, that in their hurry the Americans overlooked the essential condition here—‘safety first.’ One of the factors of their success, perhaps the principal one, is undoubtedly the almost universal use on the American railways of freight-cars of large carrying capacity compared with the standard British wagons and vans for merchandise traffic, also the wagons used for mineral traffic, especially coal and dress.

The obvious gain and advantage in the use of large wagons for the working of goods and mineral traffic are economy in engine-power, time, and haulage; less shunting and marshalling; more steady and smooth running, thus making for greater safety and freedom from accidents alike to the trains themselves and the merchandise carried, this last probably the greatest economy of all, as there can be no doubt whatever that more than 50 per cent. of the claims for damage by breakage, chafing, tearing, leakage, &c. are directly due to the excessive shunting of long, loosely coupled trains in station yards and at roadside stations, which, under present working conditions and type of plant, cannot be avoided. Why the British companies have not boldly adopted the American type of wagon with all its advantages is difficult to understand. Perhaps our insular prejudice or conservatism is the cause; or it may be the hesitancy is due to fear of the cost. Whatever the reason, it is not complimentary to the British companies, and would seem to indicate a lack of enterprise or courage. ‘Tis true, ’tis pity, and pity ’tis ’tis true.’ They must wake up and bestir themselves to perform their part in the great industrial organisation of the country, and by developing their resources, and changing (revolutionising if necessary) their system, be better equipped in the material sense at least to overtake the tremendous increase of traffic that will surely follow the declaration of peace. The adoption and use of large wagons of thirty, forty, or even fifty tons capacity would, of course, necessitate a change in the system of working; but this would not be so formidable as at first appears. Indeed, when worked out in detail, the difficulties (financial and otherwise), which bulk so largely in theory, would simplify

themselves in practical working operations and be falsified by experience. The Caledonian Company is the only one, in Scotland at least, to show any enterprise in this direction. It has a number of large wagons, but no large vans. The tendency, however, to adopt the principle is certainly making progress, particularly in regard to coaching stock, as is evidenced by the large, sumptuous corridor trains and the dining, sleeping, and Pullman cars now in use, all purely American, even to the adoption of the name ‘car.’ But why not extend the principle to the merchandise and mineral traffic? What is there to fear? Nothing! It would simply be a change to a better condition, which results would amply justify. The iron road is now heavy and strong; the engines are likewise heavy and strong; the other conditions have therefore, I fear, been more largely magnified in our horoscope than would be found in actual working experience.

While a number of small wagons may still be required for private works and siding traffic, also certain traffics, such as oils, chemicals, ice, draff in bulk, &c., which cannot well be mixed with other goods (although even such consignments could be conveyed in large wagons by having them built with tight bulkhead partitions, which, when not required, could be opened and the whole space thrown into one), nevertheless fully three-fourths of the present merchandise trucks could be dispensed with altogether, and practically the whole volume of traffic dealt with in large wagons, open and covered.

The manner of dealing with the traffic would, as already indicated, necessitate certain changes, and the following examples or illustrations of traffic-working are probably the lines on which these would be conducted.

First, local traffic, usually the most difficult to handle, so as to secure full loads for the proper utilisation of the plant. From all large cities or centres (such as Glasgow) the traffic for local stations, say from twenty-five to thirty miles out, serving fifteen stations, would be despatched twice a day (perhaps only once under present conditions); the evening train leaves with anything up to forty wagons, containing, roughly, one hundred and sixty tons goods traffic, the whole of which could quite easily and more safely be carried in five or, at most, six large wagons, the goods to be loaded and stowed at the starting-point in station order, thus at the outset avoiding shunting and marshalling. Two or three porters, called ‘train porters,’ would accompany the train, and, with the assistance of the station staffs, discharge the traffic on to the

station shed platform, or, in the case of small stations, into the store on passenger platforms. Goods to be uplifted would then be loaded up in the right wagons in like manner. Traffic for stations on branch lines would be put out at the junction stations, but when there was sufficient for one of the large wagons it would be detached and taken forward by the branch train. The work of loading and unloading merchandise at the stations by the train porters and station staffs would be expeditiously performed, and in less time than is at present occupied by the train men, the guards, and yard staffs combined, in the shunting operations of placing wagons inside the shed and sidings, shunting out, marshalling, and placing outgoing traffic on the train (it is usually in this process and at this time 'transit' damages occur). This is simply an extension of the sundry-van system, the invoices taking the place of the van way-bills. Many advantages would thus accrue: the goods would be checked forthwith; discrepancies, shortages, condition, and actual damage, if any, at once discovered and noted; and the goods safely put under cover, so that no subsequent damage might occur. Under the present conditions and system of working, especially at country stations, the merchandise is allowed to lie in the wagons until consignees take delivery, who, for one reason or another, may not do so for four or five days after being advised. All this time the wagons with their contents are exposed to the weather (and our weather is often unkind); they are also subjected to shunting operations several times each day, when further 'transit' damage occurs. In this connection heavy claims are being made at present. It is really surprising they are not much heavier when valuable goods are exposed to such unnecessary risks, but under the present working conditions there is absolutely no hope or prospect of any reduction of this serious loss to the companies; in fact, the number and value of claims have now reached alarming proportions, and are still steadily increasing. On this head alone, for the prevention of claims, the system recommended is entitled to the serious consideration of the companies, as only in this direction is there any guarantee that an improvement could be effected, even including 'pilferage' in transit, a source of claims at once the most prevalent, the most costly, and the most difficult to locate or check. Demurrage would give place to storage charges. These would be easier to collect, and more profitable, but would have to be rigorously enforced to prevent abuse of shed accommodation.

Second, through traffic arising at roadside stations on the main line, but requiring transshipment, would be dealt with in the same manner as local traffic, including also branch line traffic. It would be loaded up in the large vans on the main line trains, labelled direct to the regular and common transfer stations, such as Carlisle, Leeds, Preston, Crewe, Newcastle, &c. These

stations would, therefore, only receive from the north four or five large wagons tranships from each district instead of forty or fifty separate wagons as at present, traffic flowing from south to north being dealt with in like manner. Note: the cost of the train porters might be met by reductions of staff at the country stations, whose work they partly perform.

Through traffic in full wagon-loads is much easier to arrange and organise than local and roadside traffic already referred to; train porters are not required, as the goods are loaded and unloaded at the terminal stations, where large staffs of porters are employed. The traffic is, therefore, more economically manipulated, and the saving of plant is enormous, as the following will show.

To take Glasgow again as a centre, there are despatched from the principal stations fifty merchandise trains daily with traffic for Edinburgh, Dundee, Aberdeen, Greenock, Ayr, Newcastle, Liverpool, Manchester, Leeds, Nottingham, Birmingham, London, &c. Each of these trains consists of thirty wagons (a low estimate), containing, roughly, one hundred and fifty tons of merchandise (a high estimate), because, on account of the limited cubical capacity of the British standard wagon (if there is a standard wagon), it is filled up long before its weight-carrying capacity is reached; hence the duplication of wagons and the creation of long trains. To follow this out, it will be seen that these fifty trains are hauling no fewer than one thousand five hundred wagons, carrying probably five thousand tons of merchandise dead weight.

Under the large-wagon system now advocated, the whole of this traffic could have been stowed in two hundred and fifty wagons, each of thirty tons capacity; fewer still if forty or fifty ton wagons had been used. These figures refer to the traffic from only one city and centre; but multiply that, say, by fifty cities and centres throughout the country, and the enormous saving effected would be clearly demonstrated to, and appreciated by, every railway official. The trains could be reduced nearly one-half in number, thus securing at once great reduction in locomotive power, train mileage, rolling stock, siding accommodation, and claims—this last not the least; indeed, the economies effected would be both large and manifold, but can only be realised to the full by practical experience as the system unfolds and develops itself.

Third, the same principle can also be applied to mineral traffic, especially coal and dross, which can be most advantageously dealt with in large consignments, so that to secure full loads in the larger wagons would be simply a matter of arrangement between senders and consignees. The smallest coal-merchant can, generally speaking, deal with twenty-eight tons at one time—that is, one large wagon, say, once or twice a week, equal to four or eight wagons respectively.

the case of large merchants handling over a hundred tons daily, the economy in plant is, of course, greater in proportion. This quantity could be carried in four wagons instead of perhaps fifteen, as at present. The new wagons would have end doors, and also be fitted with partition doors—the latter, when not required, could be opened—so that small consignments for private parties could still be carried; but it would be incumbent on senders to have consignments sufficient to fill all the compartments each journey, senders to declare the weight of each consignment, as at present.

The wagons would not require to be detained more than one day, which would be essential for their proper economical working. Merchants would, therefore, require to discharge into the coal-bing any part of the contents not immediately disposed of to works or houses. Depots in future would consist of larger bings, and more of them. On the other hand, the sidings would be practically empty, or, better still, cleared each day, because the wagons would be kept moving. The collieries would also have a regular, steady supply; demurrage would practically cease for station traffic, as the charge would then be on ground rent, which would be more easily collected and more profitable to the companies; though the charge for demurrage, when it was found necessary to levy it, must be heavy—prohibitive, in fact—consequently there would be no inducement to risk it.

Shipping and sea-borne traffic could also be dealt with both expeditiously and advantageously. With suitably enlarged harbour facilities, gangway hoists, and shoots, a cargo of, say, one thousand tons of coal carried in thirty-five large wagons could be put on board in much less than half the time occupied in shipping the same quantity out of one hundred and twenty-five wagons of the present type. The time taken to tip the contents of a large wagon is practically the same as in the case of a small one. The saving of ships' time alone is obvious, and would be much appreciated by shipping companies.

A further advantage which would accrue through the speedy clearing of steamers, either when loading or unloading, is the practical solution of the 'congestion of ports' difficulty, as the only possible relief port authorities can hope for in this regard is a large reduction in the excessive number of wagons about the docks. Any change that would effect this, without reducing the railway facilities—that is, the carrying capacity of the wagons supplied, also their mobility to meet all the present demands of shipping, with power to increase same, which is confidently expected to be required in the very near future—would be heartily welcomed by port authorities. By the adoption of the large-wagon system, a reduction of from 50 to 75 per cent. of wagons about the docks could be secured. What an immense improvement in the shunting and general work-

ing of harbour traffic could thus be effected! It is, in fact, the only proposition or scheme yet suggested whereby congestion at ports may be overcome, so far, at least, as the railway companies are concerned. The confusion and congestion so common at large railway stations—in fact, almost chronic at some places—are a source of serious loss, trouble, and vexation both to the trading public and the companies. This condition of affairs is not really the result of, or caused by, the volume of traffic passing, heavy as it is, but is due entirely to the extraordinary number of wagons involved or used in carrying it, which, in turn, necessitates the large number of trains to manipulate them. At present there is an insistent, clamant demand for more station and siding accommodation, more trains, and more loop-lines to run them along; and this demand must be acceded to if the work is to be carried on under the present unsatisfactory system. But to continue the present system would be most unfortunate. It would simply be a sop to Cerberus—more wagons, more sidings. To increase the one necessarily involves an increase of the other, which merely perpetuates the evil, and the expensive increase of both wagons and sidings would become imperative and absolute. The position in this regard is parallel with that in pre-demurrage days, when the coalmasters filled the wagons (and kept them standing under load) as fast as the railway companies could build them. Like *Oliver Twist*, they demanded more, the excuse being to keep the collieries working; yet the demand was wholly unreasonable and unwarranted, as the thousands of useless wagons left on the companies' hands clearly proved, whereas under this new system of large wagons the companies would find themselves with miles of sidings at their disposal.

In like manner, therefore, the solution of this difficulty is clearly in the use of wagons and vans (mostly vans) of large carrying capacity of thirty, forty, or fifty tons each. The proper working and utilisation of such plant would involve changes in the method of handling the traffic as demonstrated, and shown in outline, in this article.

The British companies should tackle this question, this revolution, in fact, at once. No more wagons of the present type should be built; but perhaps in this epoch-making age the duty will fall to the Government, when they take over the railways wholly (as rumour confidently assures us is coming). *Inter alia*, this would be a fitting reform with which to begin the many and great improvements expected and hoped for under the new regime. The deeper this matter is gone into, the more it is considered in detail for practical working operations, the more railway officials and men are impressed with the almost unlimited possibilities our railways now actually possess not only to cope expeditiously and satis-

factorily with the existing traffic—which, under present working conditions, has nearly overwhelmed them—but also to develop, under the new conditions, resources and facilities for dealing

with further large increases of traffic more freely and more economically, as scarcely 'even dreamt of in our philosophy.' But it must be grappled with thoroughly.

## 'VON TIRPITZ:' THE TRUE STORY OF A SUBMARINE HUNT.

By JOHN S. MARGERISON.

'AND this,' moaned Lieutenant Augustine Reginald Batty, Royal Navy, commanding officer of his Majesty's elderly and disreputable Torpedo-Boat O 36, 'is what they call a patrol station. In my opinion, it's a blinking refrigerator, and I should like to have ten full unofficial minutes with the bounder who detailed me to look after it.'

He snapped out an order to the helmsman which sent O 36 gliding well to the starboard of a monster iceberg, and buttoned his lammy suit closer to his chin in the keen air. His sub-lieutenant and second in command, one Marmaduke Bliss, smiled happily at his senior's outburst. He didn't mind the loneliness at all, and the cold left him unaffected.

'I wouldn't moan about anything at all,' went on Batty, as O 36 steadied on her course once more, 'but we never see anything worth *strafing*. Now, if only an occasional chance submarine would lose her way and meander in this direction, so that we could *strafe* her, we might bring the fact of our existence to the notice of the powers that be, and get removed to some more exciting beat.'

Bliss stiffened suddenly, and flung out a pointing hand to the northward. 'What more do you want than that?' he queried. 'Old Von Tirpitz himself come to pay you a call.'

'Glory be!' exclaimed Batty. 'It's actually a submarine, I do believe; though what the dickens she's rigged up with beats me. Give her a round from the fore-castle gun, quick, and for the Lord's sake plug her! We haven't had a chance like this before in all our lives.'

With the aurora borealis making delicate tracery on the night sky behind her, and with gigantic icebergs encompassing her on almost all sides, lay a German U-boat. In the light the two officers could even see the black-and-white diapered lines on her upper part, and the white-painted U on her conning-tower. But she was not as other U-boats. From her bows, extending on each side and outwards, curved like the claws or pincers of a lobster, were a pair of antennæ, the invention of her own *oberleutnant*, and the means whereby she had up to now managed to cut her way through various nets set to catch her.

Night-time was her favourite period for breathing, and, like other of her sisters, it had indeed proved to be the only safe time for coming to the surface. Therefore, when O 36

called to her with the fore-castle six-pounder, she resented the interruption, but stayed not to argue. Deeming the depths safer and more peaceful, she dipped hastily, just as the six-pounder shell, flying wide, exploded near the summit of an attendant iceberg. And the chunks of ice flung apart by the explosion fell crashing into the sea, some even sinking as fast as she did. Indeed, one huge piece, weighing some fifteen tons, dropped clean on the starboard claw of her net-cutter, and snapped it off like a rotten carrot.

O 36's officers swore heartily and unashamedly, and very loudly, at that unlucky layer of the six-pounder.

'Best chance we ever had, and we missed it,' they cried in unison, as the boat reached the spot lately vacated by the German. 'But he won't get any peace now we've seen him. We'll make his life a mizz.'

And they did. Their wireless called to all the other boats of the patrol, reported 'Von Tirpitz,' and made arrangements to ensure the complete misery of her life thereafter. And by means of their own, possessed by all U-boat hunters, they shadowed that one-whiskered submarine so that she became a fugitive. Wherever she went some craft with designs upon her life showed up and headed her off. A drifter caught her one day, and it was only after three hours' bitter fighting with the bomb-charged nets that the submarine got away. On another occasion a trawler ran a wire-hawser sweep under her keel as she lay on the bottom, and the submarine only got clear in time. Three minutes more, and that red tin of gun-cotton, with electric wire attached, which they slid down the taut wire, would have rested against her hull, and, upon the touch of a button, have sent her sides crashing inward like a squashed bully-beef tin.

They headed her back into O 36's sphere of influence at last, and one night she came up for breath as usual. The six-pounder again snapped angrily, and this time the port leg of her antennæ flew circling through the air, leaving her as any other boat.

She slid downwards rapidly, and pushed blindly southward again at a horrible depth, while her storage-batteries sparked badly and gave off fumes which almost choked her crew. By good fortune she managed to hide herself for one full day in a Scottish inlet; but at the end

of that time a scouting motor-boat asked her, *via* a three-pounder semi-automatic gun firing twenty rounds a minute—and the motor-boat spoke for a full minute, too—what she wanted.

As 'Von Tirpitz' had no convincing answer ready, she evaded the question in her usual way, and added a second bloodthirsty tracker to the list of her immediate foes. For nearly a hundred miles across the North Sea the torpedo-boat and the cockle-shell motor-boat followed her, and the submarine began to hope that at last she was bound for home. But she ran into a long line of more than usually dangerous nets, and turned back disgustedly, running again to the south-east. Although she did not know it, she passed once more from O 36's ken; but the motor-boat, being tied down to no restricted area, accompanied her as if towed. They made the mouth of the Channel, just off Dover, and here a paddle-boat added herself to the chase, an elderly paddle-boat, whose name ended with 'Belle,' and who had once carried holidaying crowds to 'fortified towns' on the south coast, such as Ramsgate and Margate. She ran up alongside 'Von Tirpitz' one night, just at breathing-time, and failing to ram her, owing to some trick of tide or helm, tried to drop a lump of dynamite down her open conning-tower hatch. But the light was bad, and the bullets from the German *oberleutnant's* revolver whistled round the skipper's ears; so the attempt failed.

She shook off her trackers, save for the motor-boat, who now became so weather-stained and short of fuel and provisions that she had to appoint another small pigmy craft as her deputy. And some inquisitive vessel, seeing the strange motor-boat on the job, spread a rumour that there were now two submarines instead of one in the hunt, and hopes rose accordingly. The disappointment, when it finally came out that it was still the same old craft who was being hunted, was intense, but made the hunters all the more determined to kill.

Then came a day when 'Von Tirpitz' found herself surrounded, quite close to shore, and well within O 36's beat, by a host of small craft—trawlers, drifters, ocean-going tugs, paddle-steamers, mostly from the Clyde and the Forth; motor-boats, and one or two torpedo-boats, who proclaimed their presence hoarsely, and stood aloof to watch or to bear a hand as the necessity arose.

The submarine tried to break through to the open sea; but the snares were too strong for her. Fighting bitterly all the time, she was driven towards the land, over the mud-flats and sand-banks. She tried to dive, but the bottom was too close for safety, and she bumped upwards at an alarming rate. Then she turned, and really, before she knew it, discovered an ancient runway, unguarded by nets. She promptly took it, leaving behind her periscope—a six-pounder shell from a resentful drifter snapped it off—and

emerged at the other end temporarily free, but blind.

Another day of grace was accorded her, during which she rigged her spare eye; but this time wandering coastguards turned her into a rifle-practice target, and succeeded in scoring bull's-eyes on three of her crew.

Followed another week of hunting, during which 'Von Tirpitz's' crew grew sullen and discontented, and only their hatred of the hunters prevented their mutinying incontinently and surrendering their craft to the patrols. But their *oberleutnant*, like the sportsman he was, told them that it was up to them to see the game through, and read them extracts from German newspapers which stated that all submarine crews captured with their ships were towed astern of their own boats and drowned.

'But,' he added, 'I have every reason to believe that if the boat is lost, they simply intern the crew till the end of the war; but even that is not good enough for us children of the Kaiser. So, if the end comes, we must destroy the boat. That, of course, means that we shall all be killed outright.'

Now, I have said he was a sport, and he did not want his men to be killed. One should die for the safety of the others, he explained. 'We will all draw lots,' he went on—'I with the rest of you. The man who has the ace of spades'—or its German equivalent—'dealt to him will be the selected man. When the end comes—if we cannot escape—that man will stay below while the others go on deck, and he will have a bomb with an instantaneous fuse ready in his hand. When the hunters come to take off the prisoners, I, or the senior man on deck, will kick hard three times in succession on the hull. Then the bomb will go off, and if the accursed British get the men, they will lose the boat. Is it so?'

'It is so,' growled the crew, and the cards were dealt.

Breathlessly each man grabbed his little pack as they came to him, and a little fair-haired youth gasped with terror. Then he straightened his shoulders and looked his officer between the eyes. 'The honour has fallen to me,' he said simply. 'It is enough. The Fatherland demands it.'

For the next day, and the three following that, the little fair-haired Saxon prayed that the God of Battles would see U 72 through the mess. But stores ran short; provisions were giving out at an alarming rate, and the storage-batteries were running dry. U 72—or 'Von Tirpitz'—decided to seek another friendly inlet, ignorant of the fact that there were now three motor-boats acting as her shadows.

She sought shallow water, where she could lie secure and rest. But she found it not till the third day, when the battery almost refused to give off enough current to run her motors. And then, with the three motor-boats close on her

heels, she ran into shoal water once more. No runway opened to her this time, the bay she had chosen was landlocked, and the way to the sea barred by those three boats.

'The end has come,' remarked the *oberleutnant*. 'You are ready, Johann?'

The fair-haired boy went to a locker, and removed a small case. From its interior he disinterred a spherical object. He withdrew the safety-pin, and handed it to his superior. Then he placed his thumb on the trigger—the loosing of which would immediately detonate the bomb—and knelt close to the hull.

'I am ready, Herr Leutnant,' he said.

'Surface; blow all ballast,' ordered the officer. The boat shot upwards, twenty yards away from the trio of hunters. The conning-tower hatch sprang back, and the crew filed slowly out on to 'Von Tirpitz's' whaleback. One of the motor-boats' captains seized a megaphone.

'Anybody there speak English?' he commanded.

'I do,' replied the lieutenant, sure of the next question.

'Then what about it?' came the words. 'Do you surrender?'

The German shrugged his shoulders. 'I have little option,' he replied. 'Yes, of course.'

The three motor-boats moved slowly, cautiously ahead, their pigmy guns ready for immediate action at the first sign of treachery. Those men who were not guns' crews loosened their automatics.

Twenty yards away two of the boats slowed and stopped, keeping their guns trained on the U-boat's conning-tower. The third shot alongside, a brown-faced officer, R.N.V.R., in the stern-sheets.

'All there?' he asked. 'Nobody below?'

'No one at all,' replied the *oberleutnant*, as he made to step into the boat.

'Hang on a minute, then,' was the order, and the brown-faced young man swiftly counted the Germans. Then, pistol in hand, he clambered to the submarine's whaleback. The *oberleutnant* stepped quickly towards the conning-tower.

'Wait a minute, Herr, I said,' interposed the R.N.V.R. officer. 'Don't be in a hurry.'

He thrust the muzzle of his automatic under the German's nose, and the latter gave back a step.

'Bates,' called the Englishman to his coxswain, 'just keep your pistol on these chaps, and if any of 'em try to approach the conning-tower, plug him. I'll stand the racket.'

He drew himself swiftly to the top of the tower, and dropped within. Inside, close to the hull, he saw a fair-haired youth, crying bitterly, but with his ears cocked for a signal. And in his hand was a bomb.

'Don't drop that thing,' said the R.N.V.R. man quietly in German, 'or it might go off, and then you'll lose that nice, comfortable internment-

camp we've got ready specially for you. Besides, if you do drop it, your mother will miss you ever so much. And don't forget I've got a pistol pointing straight at you. Best come on deck with me, and don't be a ruddy fool.'

The fair-haired youngster, at the first words, started. He thought swiftly. The signal—the three kicks—had not come; therefore his comrades were still on deck. If he exploded the bomb he would kill them all as well as himself, and that was what he didn't wish to do. And at the mention of his mother he broke down completely.

He stood up, and, with the few words of English at his command, intimated his willingness to accompany the captor. The latter pointed to the ladder with his pistol, and followed close on the Saxon's heels.

'Now then, over into the sea with it, quick!' he ordered, at the top. The explosion drenched the German crew, but did no other harm. The transhipment took three minutes, the run to shore and the posting of armed guards on the landed prisoners another three, and then the motor-boats returned to the carcass.

They searched 'Von Tirpitz' thoroughly. They found quite elaborate plans and charts on board her, some of British ports and others of German harbours; and they also found the huge store of gasoline which she had not been able to use through being kept below the surface by the barriers.

'And that reminds me,' said the R.N.V.R. skipper, 'I've wired to — for the torpedo-boat which usually beats in that neighbourhood to come and take this boat in tow, and, as we've used quite a lot of Government gasoline in the capture of the packet, I don't see any reason why we shouldn't fill up from these tanks. Anyway, it'll be something to do while O 36 is on her way down here.'

The tanks had scarcely absorbed the last drop ere O 36 poked her inquisitive nose into the inlet. Batty was quickly put in possession of the facts and of the 'kill,' and as he passed a wire-hawser for towing her, even as he rang down for speed on his engines and went ahead, he gave vent to his feelings once more.

'Once in a blue moon we saw a submarine, and worked like devils to catch her. And then, after three weeks of the most harassing work we've ever done, we have to come and take her in tow, somebody else having got the credit and prize money. If there wasn't a war on I'd send in my papers, and start a farm.'

'And,' chipped in Sub-Lieutenant Bliss, 'you'd be back to sea again in a week, even if they sent you Arctic-exploring.'

He would have said more, but a flying log-book took him neatly by the back of the head, and when he had recovered his composure the only words he found handy were profane, and therefore unprintable.

## SIAM IN 1863.

By F. NICOLLS.

**I** SOMETIMES wonder if there is any other Englishman alive who visited Siam over half-a-century ago. There is certainly not one who went there twice, travelling what used to be called 'overland' from Burma, though to get to Bangkok, the capital, most of the journey has to be performed by boat. I was trading in timber in those days, and my first visit was from Moulmein to Raheng, a journey which occupied some ten days by boat and elephants, and then from Raheng by boat to Bangkok down the river Menam, which took nearly as long. Roads in the wilder parts of Siam and Burma are very much what they were fifty years ago, mere paths in the jungle made by the constant passage during three or four months of the dry season of the year of traders and pack-animals, uphill and down dale, through thick forest growth. The pack-animals may be elephants, which open out a fairly wide path, but oftener consist of bullocks, mules, or ponies. If a large tree is blown down by the high winds which often accompany the change of monsoons, no one in a caravan of traders, as a rule, thinks it worth while to cut through or remove the obstacle. A detour is made twenty or thirty feet on one side or the other, which becomes the road of the future. Where there are many of these fallen trees in a day's march of ten or twelve miles, the journey is considerably lengthened. Jungle grows fast in a tropical country with an annual rainfall of perhaps eighty to one hundred and twenty inches, and large trees sometimes fall across the new pathway, necessitating, as no one will undertake the trouble of clearing them away, a fresh detour, and thus a fresh addition to the length of the day's journey. There has been some talk of laying a railway between Moulmein and Siam, but in the meantime the jungle track is much like what it was when I travelled on it just fifty-three years ago. Raheng was then a fairly large and prosperous-looking town. There were numbers of well-built teak bungalows, and each house had a compound with fruit-trees and flowers surrounding it. The Siamese Governor did all he could to assist us on our way, and during the week we were in his jurisdiction sent us daily presents of fruit and fish. He eventually obtained for us two comfortable boats, in which we proceeded down the Menam to Bangkok.

We did not come across anything in the way of game between Moulmein and Raheng except green pigeons and jungle fowl, but on the banks of the streams where we encamped at night we saw marks of tiger, deer, and wild pig, which had evidently come down to drink. There were said to be small villages

of hill-folk within a few miles of the route, but we did not come across any. We were carrying our stores with us on hired elephants, and our object was to get to Raheng as quickly as possible. Game was doubtless to be had in the vicinity by those who could spare the time to look for it. During many years of forest and jungle life I have never seen a tiger in a wild state, though constantly coming across the marks of their claws on sandbanks and the banks of streams. They have not the objection to crossing water which cats have, and sometimes are seen swimming a large river like the Irawadi in Burma. About the beginning of last century there seems to have been a pretty general belief that elephants would not breed in captivity. I suppose this has vanished now, for many young ones have been born amongst those kept by the Commissariat Department in India, and by the Burma Forest Department. In Siam elephant-breeding is fairly extensive. I have seen as many as eight young ones following their mothers in the forest near a village of not more than a dozen houses. The mothers take great care of their young, and female elephants seem to act on the co-operative principle, feeding near one another and helping to surround the young ones at the least sign of anything like danger. The male elephants of the same village are kept at a distance, usually grazing with their hind-legs hobbled with cane, half a mile or so from the females. There is always a demand for hire of elephants either for dragging timber or for baggage purposes. Prices have more than doubled in Siam and Burma during the last fifty years, and three thousand to four thousand rupees each are given for animals which might have been bought fifty years ago at from eight hundred to one thousand five hundred rupees apiece.

Bangkok in 1863 presented a very different scene from what it does now. The Suez Canal had not been opened, and such trade as there was with Europe was by sailing-ship round the Cape. There was only one road, and communications were all by water. The houses were mostly floating, attached by cane-ropes to large teak logs sunk in the river, or the numerous canals leading to it from all sides, something like the hobbles attached to the legs of elephants when they are let loose to graze in the forests. These went up and down with the tides, keeping the houses always on a level. I spent a very pleasant week in a floating house, the guest of a young Frenchman employed by one of the Bangkok firms. Unless one looked outside it was hard to guess that the house was floating at all, except that occasionally the cane attachments

made a squeaking noise in the process of going up or down. We used to have our morning coffee and toast seated on the open front veranda, with hundreds of boats, of all sizes, and sampans passing to the markets laden with fruit, vegetables, betel-nut, tobacco, fish, and almost everything required for domestic consumption. There was no necessity to go or send to the market at all, for all supplies could be bought from passing boats. My host told me that at certain seasons of the year he could catch large prawns off the posts of his house in a butterfly-net he had for the purpose, and that he often had curry for dinner made from prawns which he had caught an hour or two previously.

Sir Robert Schomberg was British Consul-General when I was in Bangkok. He had been a great traveller in Brazil and South America, and was an enthusiastic botanist, but he was getting past work, and the business of the Consulate was principally carried on by Thomas George Knox, the first assistant. The names of others in the Consulate, I remember, were Alabaster and Edwards, and the medical officer was Dr Campbell. Alabaster was a studious man, and afterwards wrote a book on Buddhism, *The Wheel of the Law*, which had a great vogue in its day. Knox had served as an officer in a British regiment in the Punjab, and after he had resigned the service gravitated to Singapore and Siam, where he was appointed by the King of Siam to drill the Siamese army. He learnt Siamese thoroughly, and was employed as interpreter in the British Consulate, eventually, I believe, becoming Consul-General. The then King of Siam was the grandfather of the present monarch, and one of the few Eastern rulers who took some trouble to improve himself and to become acquainted with affairs. He could read and write English, and corresponded with President Lincoln of the United States, suggesting that he would find it advantageous to introduce elephants into America, and offering to send him some to make the experiment. Lincoln, who was then occupied in putting down the Confederate rebellion, wrote a courteous letter in reply, thanking the king for the kindness he had always displayed towards citizens of the United States in his dominions, and to the missionaries who had settled there. He pointed out that the climate of most parts of America would be against the acclimatisation of elephants, and that the extension of railways and steam navigation seemed to afford better means of carriage, both for men and merchandise, in temperate climates.

Siam at that time possessed no railways or tramways. She has now over two hundred miles of railways, and a tramway in Bangkok. There are said to be about fifty miles of roads in Bangkok at the present time, whilst when I was there in 1863 there was only a single road little over a mile in length. Siam is the

one remaining country of tropical Asia that has been able to preserve its independence, and this is doubtless due in a large measure to the wisdom of her rulers during the last fifty years, and to the spread of education. Her future will no doubt largely depend on the continuance of good government. The country is fertile, and her position would seem to be favourable for attracting the trade of the southern provinces of China. It is noteworthy how German trade interests increased in Bangkok in the closing years of the last century, when they managed to acquire Holt's line of steamers plying to Singapore and Hong-kong. The war should give British traders an opening for renewal of their trade with this progressive state, which it is to be hoped they will not neglect, and of which the friendly and pushing Japanese have partly availed themselves already. The Siamese have learnt in the last twenty-five or thirty years that low-priced articles are not necessarily the cheapest in the long-run. British manufacturers, if they want to push their trade in Siam, will have to study the demands and requirements of their customers after German fashion, and not act as if they thought that their particular makes must be the best, and should therefore satisfy all tastes.

#### THE TOWER OF THE PICTS.

WHO are the folk by the Loch that dwell ?

Can you understand ?

In the birch-trees that grow in the shadowy dell,  
Or the bracken that climbs on the side of the fell,  
Or the silver strand ?

Do you see them gliding from tree to tree.

Or among the bushes,

Mounted astride the humble-bee,  
Or the dragon-fly, shimmering o'er the lea,  
Or over the rushes ?

Who are the folk that built yon walls

Hoar with the ages,

Which echoed with war-like cries and calls  
As they gathered the cattle into the stalls,  
While the combat rages ?

They all are gone, and we do not see

Their faces peering

Over the walls, with gibbering glee  
And fiendish shout, nor ever do we  
Now hear their jeering.

For the men have gone, they have passed away

Into history's dream,

And naught is left but the peaceful bay,  
And the gray old ruin of yesterday,  
And the murmuring stream.

But the kindly folk will come to you,

And do you no wrong ;

Though not to many, but yet to a few  
Is given the sight, ever old, ever new,  
Of the Elfish throng.

## SEVENTH SERIES

### FREE PASSAGE.

By C. G. NURSE.

**SERVICE** in the Indian Army has its attractions in the way of pay and larger pensions, but it has also its disadvantages. In peace-time an officer of the British Army serving in India has many opportunities of getting a spell of service in Great Britain, either on promotion to another battalion or by getting detailed for a couple of years at the depot. In either case he gets a free passage home and out again if he has subsequently to join a unit serving in India. The Indian Army officer, on the other hand, can only get home by taking leave, in which case he not only loses a considerable amount of pay, but also has to bear the cost of his passage both ways. It is true that if a subaltern of the Indian Army is sent home on sick leave, he gets a free passage; but even then he has to find his own way to India on the expiry of his leave. The cost of a passage to England and back is, more especially to a married officer, a very heavy expense, even if he travels second-class, and a considerable number of officers consequently never attempt to take leave home while serving in the junior grades, but content themselves with leave to Kashmir or the Himalayas. A few of the more enterprising, if impecunious, spirits manage to get cheap passages on 'tramps,' and I have known one or two cases where officers worked their passage as stewards or in some such capacity. Such methods do not commend themselves to the authorities, and are usually kept dark by those concerned.

In my subaltern days I once got a passage to India at about half the usual fare in a boat carrying fifty tons of dynamite on deck. We had a pretty bad passage, and arrived at Bombay several days behind our time, so that I overstayed my leave. But as the dynamite did not explode, and my leave was extended in due course, I was eventually none the worse.

Some twenty years ago I was serving at Aden, where, for my sins, I have been unfortunate enough to put in two terms of duty. I have occasionally met men who said they liked Aden, though it was generally when they were well away from it; but I cannot remember having come across any one who professed a liking for it during the hot weather. When I was there one of our favourite discussions at mess used

to be whether we would rather put in May to September serving in Aden or in prison in England. The general opinion was that, if the disgrace of a conviction could be eliminated, six months' hard labour in a jail at home would be far preferable. But then none of us had tried the latter, so far as I am aware.

Like Jack Bassett, who went, however, to Quetta, in Kipling's verses, I had been for some time

Doing two men's duty  
In that very healthy spot,

when at length my turn came for leave, which was duly sanctioned. The next thing was to obtain a passage, and as several liners call at Aden, I had a fairly wide choice. But here a lucky accident served me. I am usually, like most men who have been in the army, punctual both on and off duty. But, just as I was about to leave my quarters to book my passage home, I was delayed for about fifteen minutes on a matter of duty. During this quarter of an hour I received a note from a friend, which I should have missed had I been able to start punctually.

My friend wrote as follows: 'Glad to hear you have got your leave. If you have not taken your passage, H.M.S. *Tyne*, carrying naval details from Australia, is expected in a day or two. The captain is a very good fellow, and he may be able to give you a passage if you ask him nicely.'

This was a chance too good to be lost, so I got my kit packed, and made all arrangements to leave at short notice. I had only a day to wait, for H.M.S. *Tyne* arrived next morning, and I went on board and asked to see the captain. I explained the situation, and told him I should be very grateful if he could give me a passage to England, in case he had a vacant berth. The captain's reply was not encouraging.

'Well,' he said, 'I know nothing about you, and you may be fleeing from justice for all I can tell.'

As I was in uniform, I thought the remark rather uncalled for, and my hopes of a free passage fell to something below zero. However, he asked me to breakfast, during which things began to thaw, and at the end of the meal he

said, 'I am going ashore to call on the general, and will make inquiries about you. If things are all right, I may be able to give you a passage, at any rate as far as Malta, so you had better remain on board till I return.'

All the officers on board, except one subaltern of the Royal Marines, belonged to the Royal Navy, and I ascertained from them that H.M.S. *Tyne* was returning to England with invalids, time-expired men, and transfers to other ships, after having taken out relief crews to the Australian station. Orders had been received to call at Malta, with a view to taking on board any invalids, &c., for home. I found the officers very friendly, and soon made up my mind that, if I were offered a passage as far as Malta, I would accept it, as I felt pretty sure that if I got so far some one would find me a berth or a hammock for the rest of the voyage.

In due course the captain returned, and informed me that he had ascertained from the general that I was not a fugitive from justice, but that I had duly obtained leave. He said that, if I were willing to pay the usual messing charge of six shillings and sixpence a day, he would give me a passage, at any rate as far as Malta, and probably the whole way to England. I naturally thanked him heartily, accepted his offer, and went ashore to get my kit. Besides my ordinary personal luggage I had four large cases of skins, horns, and other natural history specimens, and I really had not the cheek to present myself on board with this amount of baggage. Every one who has been at Aden knows Messrs Cowasjee Dinshaw's establishment, where one can buy almost anything from a packet of pins up to the necessary outfit for an expedition to Somaliland. As the firm in question are agents for several steamship companies, I went there to arrange for the transport of my heavy luggage. But here again luck favoured me. Just as I was making inquiries regarding ships and freights, a couple of officers of H.M.S. *Tyne*, whom I had met at breakfast, appeared. I explained that I was coming with them as an 'indulgence passenger,' but that really I had not the face to bring such a lot of kit with me.

'My dear fellow,' said one of them, 'don't waste good money. Bring the whole of your things on board. We have lots of room.'

It was not without some trepidation that I acted on his advice, as I feared that the captain might not be altogether pleased if he saw all my baggage. However, I soon got it stowed safely on board, and probably the captain never knew anything about it.

Everything had gone well so far, but we were not to leave Aden without experiencing one of the worst sandstorms I have ever seen. The wind, which was blowing from the shore, increased almost to a gale, bringing with it such clouds of dust that it was impossible to keep

one's eyes open for more than a moment or two. Some barges that were alongside the ship were nearly swamped, and when we sat down to dinner we were obliged to have the 'fiddles' on the table, though we were still at anchor in harbour.

The hot weather had not yet begun, and the passage up the Red Sea was by no means unpleasant. Several of the officers on board had been serving on survey-ships on the Australian station, and their experiences were full of interest to a landsman like myself. We played cards a good deal, and eventually arrived at Malta, where we took on a few more invalids for England. But, fortunately for myself, I did not have to vacate my berth. Among the officers who joined us at Malta was a sub-lieutenant of the R.N.R., who had been attached to the Royal Navy for a course of instruction. He was supposed to be suffering from sunstroke, as he had jumped overboard from the flagship while at sea, and had been picked up with some difficulty. I will call him Sub-Lieutenant Robinson, though that was not his name. He was placed in the charge of the ship's doctor, and was kept to some extent under restraint.

Our destination was now Plymouth, and as the weather was fine, the voyage, if a bit slow, was quite pleasant till the Bay of Biscay was reached. Sub-Lieutenant Robinson, or 'the Looney,' as he was generally called when out of hearing, seemed quite normal, and after a time the doctor somewhat relaxed his supervision, and allowed him to join us at cards, and to take part in anything that was got up to relieve the monotony of life on board ship. In fact, he turned out to be quite a pleasant young fellow, and soon became popular among us. When we arrived near the Channel some one proposed that we should have a sweepstake as regards the time we should reach Plymouth Harbour. The matter was soon arranged; twenty-four tickets were issued, one for each hour, at half-a-crown each, and an amusing evening was spent in selling and drawing for them. The winner was to be the owner of the ticket on which was indicated the time we passed the lighthouse on the breakwater outside Plymouth. The captain and 'No. 1,' on account of their official position, took no part in the proceedings, but the latter officer agreed to be judge of the time when we actually passed the lighthouse. Most of us, including Sub-Lieutenant Robinson, took a ticket or two, and the list of tickets and owners was duly posted up on the notice-board.

A day or so later, when we were already within sight of Plymouth, and had passed the Eddystone Lighthouse, most of us were assembled at lunch, when we heard the cry, 'Man overboard!' and felt the engines stop. Going up on deck to see what had happened, I found that a boat had just been lowered, and a man could be seen swimming in the sea several hundred yards astern of us.

The boat's crew being men of the Royal Navy, it did not take long before the swimmer was safely on board, together with a life-belt that had been thrown him. When the boat was hauled up it was seen that the man who had gone overboard was Sub-Lieutenant Robinson. As he came on deck, clad only in his shirt and trousers, he remarked apologetically, 'I'm very sorry to have given so much trouble, but I felt I must have a dive.'

It appeared that, when the deck was clear owing to officers having gone below to lunch, he had taken off most of his upper garments, which he had carefully folded up, and then jumped overboard, not from any wish to commit suicide, but from an overpowering desire to have a swim. The engines again started, and an hour or so later we passed the lighthouse on the breakwater,

the time being given by the first lieutenant as 3.10 P.M.

'By Jove!' said one of the officers, 'the Looney wins the sweep;' and such proved to be the case. He held the ticket from 3 to 4 P.M., and had, by jumping overboard, *delayed the ship just long enough to win*. As the total amount was only three pounds, less the usual 10 per cent. for naval charities, he was acquitted of any design in the matter, but the coincidence was certainly curious.

The ship's doctor, however, did not care to take any more risks, and, on our arrival in harbour, duly handed him over, together with the sweepstake money, to the naval authorities. I never heard what became of him, or whether he eventually got rid of his peculiar desire to jump overboard at unreasonable times.

## THE FORESTER'S GIRL

### CHAPTER X.

'**WHY** didn't you tell me?' The question, suddenly rapped out in tones of hurt reproach, sent the blood rushing to Anita Lalonne's fair cheeks. Then, ebbing as rapidly, it left them snowy white. 'Why didn't you tell me?' he repeated, while the girl's great eyes, dark with emotion, strove to meet the gray ones, pained and perplexed, looking down upon her. For Gavin Barrie had sought and found her—his little waif from far, fair France; found her among the sprawling roots of a giant pine, like a small brown mushroom among the russet needles.

As he came towards her, down a lofty aisle of the forest temple, he heard her singing, for Anita was feeling light-hearted now, and tranquilly happy. Another chance messenger from the lakes, passing through, had left her a note from David. Only a few days more, and he would be free to come for her. And so she sang—sang with a voice of no great compass, but exquisitely sweet and clear, like the notes of a bird:

*'Chantez, chantez, ma belle,  
Chantez, chantez toujours. . . .  
Chantez, chantez.' . . .*

Then Gavin Barrie! The song died on her lips. 'Why didn't you tell me?' he asked a third time; and she, poor child, feeling a sudden clutch at her heart as, in bewildered amaze, she saw something passing belief and very mortal in the eyes of her 'god,' flushed and paled, and stammered low, 'I—I thought you had forgotten me.'

'You *knew* I had not forgotten you,' came the half-bitter reply; and Anita, feeling the reproach in his voice, sat mute, her fingers nervously twisting the forester's letter.

'Come!' bade Gavin; and in silence the girl, obeying, followed him down the path to the

scene of their first forest meeting, beside the musical waters of Bear Creek. Motioning her to sit, he began mechanically fitting together the joints of his rod, and, without looking at her, said, 'I don't understand any of this, and you need not tell me unless you wish; but why did Axel call you Miss Lalonne?'

'Why did he call me Miss Lalonne?' the girl echoed, bewilderment in voice and face. 'But why *not*? I am not yet'—she hesitated, flushed crimson, then hurried on—'not yet married to David Hardy!'

They spoke in English, as though by common consent avoiding the greater intimacy of the language dearly familiar to them both.

Barrie savagely bit the fragment of gut with which he was deftly tying a fly before replying, 'The name Lalonne is equally new to me; you must be quite aware of that. But I have no right to press for an explanation.'

'Mr Barrie,' the girl exclaimed, suddenly rising to her feet, 'there is—there must be some misunderstanding. You—you mistake me for some one else. My name is Anita Lalonne, step-daughter of Monsieur Pierre Grossier of the "Rose d'Or" at Amiens, and afterwards of the "Café Bon Repos" in the Rue Saint Jacques, Paris; and you—you say you never *heard* the name Lalonne!' she ended, with a quiver of deep hurt in the slow, low words.

A light broke over Gavin Barrie's face as, with strained attention, he listened to her. 'Monsieur Grossier of the "Rose d'Or"! Was he, then, your step-father?' he asked in surprise.

'*Mais oui*. My own father had been dead a long time,' answered Anita; 'and mama—she was an American singer. You knew that, did you not?'

Gavin nodded. 'Yes, I knew that. Tell me

all about it, Nita,' he added quietly, and sticking his rod in the ground, began practising the lately acquired knack of rolling a cigarette.

'My father was a French Canadian,' Anita narrated, her hands clasped tightly in her lap, and her eyes, now sad and misty, fixed on the sparkling stream that hurried past them. 'He came of a good old family in the province of Quebec, but he was poor and a musician. By some means—I know not, nor would it interest you, m'sieur—he drifted back to *La belle France*, the land of his ancestors, and there he played premier violin in the orchestra of a small company. So he met my mother—very young then, and with a wonderful voice. *On dit*, had she lived, the world would have worshipped her in grand opera. They were married, and, being very poor, she continued to sing, and he to play. So it happened that, when they were touring the provinces, they came to Amiens, and my mother falling ill, my father lodged her with Monsieur Grossier at the "Rose d'Or," while he continued to tour with the company. There I was born. Monsieur will remember the little garden, the vine-covered arbours, the cherry-trees, and the river flowing so smoothly just beyond the gate. And "Jean Marie," the parrot. Does monsieur remember "Jean Marie"?' she asked, a tender little smile on her red lips and tears in her voice. Ah yes, Barrie remembered it all; but he merely nodded as, throwing away the newly made cigarette, he prepared to roll another. 'In that garden,' Anita continued, 'my beautiful young mother nursed and sang to me, and waited for papa to come and see her *poupée*, as she called me. But, alas! he never came. There was an accident in the crowded night streets of Paris. (*M'sieur sait tout ça bien.*) Some one brought to *ma pauvre mère* the fragments of his violin, but him she never saw again. Money she had none, nor friends, nor relatives, except in far-distant California—only her *poupée*. So, after a time, just as the *poupée* began to toddle about the garden and play with "Jean Marie," she consented to marry M'sieur Grossier, feeling so ill, *ma pauvre mama*, and fearful of dying, and leaving her child without home or guardian.'

Anita's eyes filled with tears, and impulsively

she turned towards her companion, who had seated himself on the farther end of the recumbent log; but his face, half-concealed in the concave of his hands, in which he was fostering a feeble match, being still averted, the girl, with a brave effort at self-control, continued a little unsteadily: 'She lived long enough for me partially to realise her homesick longing for the "golden state" of her birth, and to have her little daughter grow up among her own kindred; and she wrote an address on a slip of paper, sewed it in a tiny silk bag, and bade me never to lose it—carefully to keep and use it if I at any time should be in trouble. I was still too young to understand all her anxious fears for me; but afterwards—*Mais, m'sieur!*' she suddenly broke off, rising to her feet and facing Barrie, 'surely—surely you knew all this. I believed—I was led to believe by Monsieur le Pasteur de l'église Américaine in Paris that it was you—you who'—She stammered, flushed, and looked piteously up at the man, who had also risen. Then there dawned on Gavin Barrie's mouth his rare smile, so tender and sympathetic that the beholder stood amazed at the revelation of the real man behind the mask of assumed indifference.

'You understood quite right, my little Nita,' he said gently; 'and you understood also—surely you understood why it was I took myself quite out of your life? You have never regretted being sent away from Paris and restored to your mother's country?' he added in a tone questioning, yet wistful.

'N-no—no, of course not,' she faltered; 'only, sometimes I still feel a stranger here. My mother's relatives, to whom I was sent, are dead, but I had kind friends who found a place for me as school-teacher; and now—well, now I have *David*,' she ended softly.

'Yes, now you have David,' repeated Gavin in a hard, dull voice, preparing to throw his line.

For a few moments Anita watched the light fly dancing among rippled shadows; then, saying, 'I am going back to the station now, Mr Barrie,' she turned her steps slowly and thoughtfully towards the Grizzly.

(Continued on page 184.)

## INDUSTRIAL AMERICA AND BRITAIN.

### INTERNATIONAL COMPETITION AFTER THE WAR.

By E. T. GOOD.

WILL the big United States or little Great Britain win the coming trade war, as it is called? Germany, our greatest competitor before the war, will suffer from such a loss of man-power, such restrictions on her supplies of raw materials, such a weakening of her finances

—of her ability to subsidise exports—and will suffer such a world boycott, that she will be quite unable to regain anything like her pre-war position in commerce. The international trade race for supremacy in manufactures will be between America and Britain. But of one

thing we may be quite certain: we shall not experience from the United States any of that Government and syndicate subsidised 'blackleg' under-cutting that characterised German competition. The rivalry will be fair, honest trading, and that nation will take first place which can produce, ship, and sell its products the cheapest.

American manufacturers, with a huge, rich, and well-protected home market, will certainly enjoy great prosperity without troubling very much about foreign trade. But many of them are desirous of cultivating export business on a big scale—of displacing the Germans and competing with ourselves and others in neutral markets.

Before the war we had the remarkable spectacle of the United States, with almost fabulous reserves of raw material, with a manufacturing capacity equal to that of Britain and Germany put together, occupying quite a third-rate position in international trade. But the war is effecting a mighty change. To what extent this will prove permanent will depend partly upon the real competitive powers of the Americans, partly upon how far the Germans are permitted to resume trade connections, and partly upon how far we utilise our resources, how far we organise ourselves, and how far we embrace our opportunities. At all events, the industrial capacity of the United States is well worth a brief review.

The Americans, who have been enjoying an unexpected and unprecedented trade boom, free from war taxation for two and a half years, whilst we and the Germans have been concentrating our energies upon fighting, intend making a bold bid for a foremost place in international commerce after the war. They are adopting big measures and making bigger plans to retain permanently the footing in foreign markets and shipping which the war has given them temporarily. The future of the world's trade, in which we have such a vital stake, depends largely upon how far these American measures and plans succeed. The natural resources, the works capacity, and the manpower of the United States are such that that country may easily beat us in trade, providing she can build and sail her ships and sell her goods cheaply enough. Our manufacturers, shippers, and workmen must clearly understand that their future depends mainly, if not entirely, upon cheap—upon economical and large-scale—production and efficient organisation. We are confident that we shall beat Germany in the new trade race. But what about America?

President Wilson has expressed the opinion that it will be a long time before Europe can recover her economic balance, and that the United States will be in a better position than any other country to compete in the world's markets after the war. State Secretary McAdoo

has declared that it is absurd to think that American prosperity will wane after the war. Ambassador Page says his countrymen will lead us a merry dance for our money. Representative Americans even believe that they will be able to develop enormous shipping and ship-building trades. One high New York authority, the *Annalist*, in summing up the possibilities of future competition a little while before the United States entered the war, concluded that 'it was probable that for many years to come the cost of labour and materials in the United Kingdom and Germany would be as high as in the United States, and that the start which American yards had obtained, thanks to the war, would enable them to compete successfully with foreign shipbuilders.'

When the war broke out the tonnage of United States shipping engaged in foreign trade was only, in round figures, 1,000,000 tons. Between 1850 and 1910, in spite of the enormous growth of United States population, industry, and trade, the shipping of that country declined from 2,500,000 tons to 1,000,000 tons. Since war broke out more than 1,000,000 tons of shipping has been purchased by the United States; nearly another 1,000,000 tons has been launched by American builders; about another 1,500,000 tons is in course of construction; and a further 2,500,000 tons is under contract for American ownership. The United States Government has appropriated and is spending hundreds of millions of dollars on new shipping. If the full programme is carried out America will have 10,000,000 tons of ocean shipping in a few years, on the top of her 5,000,000 tons of lake, river, and coastal shipping.

In manufacturing and engineering the Americans are vastly increasing their already enormous capacity. In the iron, steel, and engineering group of trades the United States capacity of production, measured in terms of ingot steel, was nearly equal to an output at the rate of 40,000,000 tons a year at the end of 1914, though that tonnage was never attained, against a German capacity of less than 20,000,000 tons, and a British capacity of less than 10,000,000 tons. By additions which have been made, and are in course of being made, the American capacity will soon approach a 50,000,000 ton level. The Americans will require a positively enormous foreign trade in steel and engineering goods, in addition to their own home trade, adequately to employ that capacity. Similarly in the textile and other manufacturing industries, capital is being literally lavished on new plant and extensions.

Leading American firms and trusts have sent travellers nearly all over the world, and they are doing all they can to make long-date contracts. The Government has appointed ten special trade commissioners and agents to obtain information concerning the demand in foreign markets for

particular lines, and to issue reports to enable American manufacturers and shippers to plan their business campaigns. Organisations of manufacturers are devoting special attention to foreign markets. Over a thousand business delegates assembled at this year's National Foreign Trade Convention of the United States. The necessity for a large and permanently sustained export trade was emphasised. The discussions demonstrated a very strong determination to cultivate foreign business. It was announced that many schools had already been started for teaching foreign languages and trade customs; that the leading banks were giving free instruction to their staffs; that they had decided to establish many foreign branches; and it was determined to agitate for a special 'bargaining' tariff.

In weighing up the trading possibilities it is necessary to note that in spite of the vast resources of the United States, that country is not nearly so well situated, naturally and economically, for building and operating ships and exporting manufactures as is the United Kingdom. In the States the iron ore is deposited a thousand miles from the coalfields, and the steel-works, on account of the coal, are mostly between four hundred and five hundred miles from the seaboard. In spite of their low railway rates, it costs the Americans much more to assemble their raw materials at furnaces and carry the finished products to port than it costs us, for their haulage distances are enormous, whilst ours are short, and our general shipping facilities are almost infinitely superior to theirs. Again, skilled labour is extremely scarce in America, notwithstanding the enormous population. Wages, salaries, and general costs are abnormal in that country. Save in one or two specialities—motor-cars and typewriters, for instance—the Americans could not compete with us before the war; nor are they likely to beat us after the war, unless we fail very badly to organise our resources and exploit our opportunities.

Much is said about the greater per capita value of the output of the labour in America. We often have figures given us—particularly by a German with an English name who conceives it to be his duty to dictate the entire economic policy of the British Empire—making it appear that American workmen produce two or three times as much, and in some industries even five times as much, as British workmen. These figures are more than misleading—they are a gross libel on British labour and the managers of British industry. These figures, or the people who hash them up, ignore the inflated American prices, the higher costs for machinery or power,

and the generally extravagant charges for plant, machinery, automatic appliances, and management. If half what we have heard about American labour efficiency had been true, British goods would have been swept clean off the world's markets, and British ships off the sea, long ago.

Mr Gary, chairman of the United States Steel Trust, is under no illusion about America's competitive powers. He has expressed the opinion that European nations, especially Britain, will not only not be prostrate, but will emerge from the war better equipped than ever for manufacturing and exporting. And so we shall. During the war we have spent hundreds of millions on modern machinery; we have built hundreds of acres of new workshops; skilled workers have learnt to speed up; vast numbers of unskilled workers have become efficient; and our manufacturers are learning how to organise and specialise. Even our lawyer politicians have come to realise that productive industry is of some importance. But that by the way. Before the war the wages of the workmen employed by the American Steel Trust averaged no less than nine hundred and seventy dollars per man per year. Since the war started those wages have been increased by 46 per cent. Add to that the fact that the capitalisation of American works is between three and five times as heavy, per ton of output, as our capitalisation, and it will readily be seen that the chances of the United States cutting us out of neutral markets, even if they desired to do so, are small indeed.

Mr J. W. Powell, president of the Fore River Shipbuilding Corporation, testified before the Trade Convention last year that the average wages in shipbuilding in Great Britain were 50 per cent. less, and the net output per man 14 per cent. higher, than in American yards. Just before the war reports submitted to the Trade Convention showed, among other things, that a steamer costing £66,000 in England would cost £136,000 in the United States, whilst the cost of sailing was £80 per month more in wages and £20 per month more for food, stores, &c. under the American than under the British flag. The truth is that in this little Great Britain we have our coal and iron supplies, works and ports, all practically side by side; we have the best labour, in spite of all its faults; and we have absolutely unique shipping facilities. With anything like efficient commercial organisation and reasonable harmony between capital and labour, coupled with fair encouragement for industry from the State, we can obtain and retain the first place in international trade, and adequately employ all our plants and workpeople.

## THE MAN WHO SCOFFED.

## PART II.

HIS walk, unplanned as it was, drew him towards the centre of the city. He mechanically avoided the streets that were crowded, and, like a bit of flotsam on the ocean's surface, was guided and buffeted until, turning down a quiet side-street, he emerged upon the corner of a huge stone building. He glanced up to realise that it was the Armouries, and was about to change his course when a recruiting sergeant, noticing his hesitation, stepped up to him.

'Beg pardon,' he said, 'but was you lookin' to sign up?'

'Sign up?' Montague repeated the words automatically.

'Sure—sign up with the Brindle's Battalion.'

'The Brindle's Battalion?'

'Come off that parrot stuff,' growled Sergeant Saunders.

Montague shook himself together. 'I beg your pardon,' he said stiffly.

The sergeant shuffled uneasily. 'Say, don't be so dashed polite,' he said, not ill-naturedly. 'I'm here to get recruits. We're a tough bunch; we're a rough bunch; but we're men. Our boys ain't strong on polish or eddication, and they're no boozeless, anti-cigarette crowd; but they're straight; and they're game; and they're men.'

'They're men,' repeated Montague, dazed by a dizziness that seemed to wrap himself and the sergeant in an enveloping mist.

'That's what I said,' reiterated Sergeant Saunders, mentally noting that he would make Montague drop his sing-song if he ever got the opportunity. 'What do you say, old scout?'

Montague glanced up. 'Will you take me?' he said.

'Will we take you?' A broad, brown hand grasped Montague's arm, and he found himself being led into a room in the Armouries, where he discovered that his full name was Dennis Oliver Montague, that he was twenty-eight years of age, that he was an Anglican, and that his uncle Charles was his next of kin. He further found that he was the property of His Majesty King George the Fifth, for the duration of the war and six months after. 'So 'elp me; and shove 'im in to the medico.—Glad you signed up, my lad; you'll never regret it; we've got a man's job for you, and—close that bleeding door, Nokes—all right—next!'

With whirlwind rapidity he stripped for the doctor, who pronounced him an excellent example of cannon-fodder; and, still dazed, he put on his clothes and emerged into the open air, a red band about his arm proclaiming to the world that he was now Private D. O.

Montague, of the Brindle's Battalion, C.E.F. He gasped, shrugged his shoulders, then went home.

Sergeant Skimps surveyed the squad of recruits with the eye of a man who has seen recruits for twenty years and is impervious to any emotion on the subject.

'You're soldiers now,' he began, his dialect strongly reminiscent of Bow Bells; 'you're in the service now, so, kiss me, 'Arry, get your 'air cut, all of yer. We don't go in for Paderookies in the harmy. Then 'old yer 'eads hup and put yer chests hout has though you was somebody. You ain't, but don't go to tellin' no one.' (A gentle murmur greeted this sally.) 'Halways respeck yer hoficers and non-commissioned hoficers, and don't go to slapping the colonel on the back and hoffering 'im a cigar. You're in the harmy—that bloke on the hend, spit out that there tobacco—g'wan!—a filthy 'abit on parade, and it'll get C.B. for yer. Where did you 'ail from, hanyhow?—a nice specimen, I don't think—chewing when a sawgeant's talkink to yer. Now, then, fall in—hanother 'arf-hour's drill.'

For five hours that day Sergeant Skimps alternately talked, and his weary squad turned, marched, and wheeled about the gravel parade-ground. Weary to the point of exhaustion, already deaf to the interminable harangue of Sergeant Skimps, the hour of four-thirty found Montague with his first day in the army finished. He had only one desire—to seek his apartment, to feel the cool shower upon his body, and to lounge in languid repose in his dressing-gown, soothed by the inevitable cigarettes. He broke away from the little group, but was hailed by a ruddy-faced Little Englander, who had made various overtures to him during the day.

'Going up?' said the other, his accent proclaiming his British birth, tempered by ten years of Canadian citizenship.

'Yes,' said Montague; 'but I'm in a hurry.'

'Right-o! I'm with you.' He swung along beside Montague. 'This is the life,' he said cheerily.

'What?' asked Montague.

'Soldiering—a dollar ten a day, short hours, and no work—what ho!'

'Do you mean to say you like it?' asked Montague, wishing his companion reeked a little less of his recent exertions.

'Why not like it?' said Private Waller. 'We're in it, ain't we?'

'I suppose so,' said the other shortly.

Private Waller rubbed his hands together. 'He's a sergeant, ain't he?'

'Do you mean that strutting bounder who drilled us to-day?'

'Lordee! don't let him hear you say that.' The little man went pale at the thought. 'Say, if you don't like him, just wait until you see Sergeant-Major 'Awkins.'

A Cockney of even ten years' Canadian citizenship loses his h's when excited. Montague began to wince under it, and wished a dozen times that his companion would hold his tongue and give him a chance to think, to separate the varied experiences of the day, and to edit his thoughts. He shrugged his shoulders and acknowledged the greeting of Mrs Merryweather from a huge motor-car. Waller's eyes bulged.

'I say, you know some swells, don't you? What was you—a chauffeur?'

Montague considered. 'No; I was a jester, a sort of social buffoon.'

Waller considered. 'Something in the plumbing line?' he ventured.

'Not exactly,' answered Montague, and muttered, 'Duration of the war—and six months after—with plebs like this!'

'I'm a carpenter by trade,' vouchsafed Private Waller, and then emitted a shout of delight. 'I say,' he cried; 'blime, if it ain't the missus!'

In a few moments they reached a little Englishwoman, not much more than a girl, who was guiding a baby-carriage containing a chubby little youngster of some two years of age.

'Ello, Bill!' she said. 'Ow's the harmy?'

'Great,' said her husband; 'but meet my pal, Private Montague.—Private Montague, meet my old woman.'

'Glad to know any friend of Bill's,' said Mrs Waller warmly.

Montague bowed. 'Thank you,' he said gravely. 'You are giving up a lot in letting your husband go to the war.'

The girl pouted. 'E would go.'

'You said I had to, Emily.'

'But you wanted to go, Bill.'

'Of course; but I said'—

'I know—about the biby; but'—

'There you go again. Didn't you say I must?'

'Oh, well, Mr Montague—the little woman looked frankly into his gray-blue, unreadable eyes—the biby's a boy, and when he grows up I cawn't say to 'im, "'Arry, your father was a slacker!' Now, can I, Mr Montague?'

He made no answer, but a thoughtful look crept into the hard, unsmiling eyes.

'Come and have a bit of supper, pard?'

Private Waller rubbed his hands together at the prospect.

'No—no, thanks,' said Montague hastily. He was longing for privacy and the solace that comes with solitude. 'Some other night, perhaps, when we have our uniforms.'

'Good enough!' cried the cheery little man.

'Then we'll do Queen Street together and show the girls—what ho—oh no!'

Montague raised his hat. 'Good-evening,' he said.

'So long,' said Private Waller. 'See you in the morning.'

When they were alone the husband turned to his young wife with an air of pride. 'What do you think of my pal?' he asked, with an air of proprietorship.

'G'wan,' said Emily disdainfully; 'e ain't your pal.'

'He is too.'

'E ain't!' She tossed her head. 'Don't I know one when I sees one; me, the daughter of a footman in Lady Swankbourne's! 'E your pal! 'E blooming well ain't—e's a gentleman!'

Far up the street Montague was striding towards his home, wondering if any one had seen him with the Wallers, or had heard the garrulous little Cockney call him pard. Good heavens! what would his friends say; or, for that matter, how could he face Sylvester if he had been seen by that polite scion of servitude? He bit his lip. 'But I'll see it through,' he muttered savagely, 'if only to prove that the under-dog, like all other dogs, is a thing without a soul!'

It was late in October when Miss Vera Dalton, returning from her self-imposed task of helping in the Military Convalescent Home, found a letter from France awaiting her. She broke the seal, and at the first word the blood left her cheeks, and then returned to make them glowing. The letter was from Dennis Montague, and was postmarked with the heading which will cast its unique spell over us and our children for years to come—'Somewhere in France.'

#### 'SOMEWHERE IN FRANCE.'

'MY DEAR GIRL,—In a couple of hours we are going over the parapet to reach the German lines or gain oblivion—or worse. All around me the men I have worked with, slept with, fought with, are writing to, or thinking of, some loved one at home. I do not know whether the love you once felt for me has died or not, but it was once strong enough to hurt me as no one had ever done before—to tear my soul out to where I could see its rottenness with my own eyes. I could not live with myself after that, and as you must have heard, for I believe it was a drawing-room jest for some time, I joined a battalion composed almost entirely of men from the factories, workshops, and streets.

'It was partly a spirit of bravado made me do it, and partly a desire to wrestle with truth. I cannot say how hard it was at first to endure their company, their incessant, meaningless profanity. I hated every one of them. To salute an officer in the street caused me such humiliation that I thought of desertion a dozen times.

From my contempt of my fellow-soldiers to an understanding of their nobility has been a hard, cruel road to travel; but I have travelled it, and I think that somewhere on the road there is a cross whereon my pride was crucified. Vera, my prayer is no longer that of the Pharisee, but of the Publican. I was offered a commission; I was urged to join the signallers or the machine-gun section, because there I should find men more after my own stamp; but I refused—the memory of your words made me stick with the men I started with.

'I have found them crude, uneducated, unambitious, but true as steel, and asking no better reward for their heroism than that their "missus and kids" will be looked after at home. I tell you, Vera, that when the war is over we shall have to realise that it is not only the consumptive and the imbecile that deserve care and thought. There is a grandeur and manhood in the ordinary, unlovely, unkempt man of the streets that our civilisation has failed to bring out, but which war has done. So much has war given to us; so much has peace failed to give.

'Life has become a riddle to me, still fascinating, but fascinatingly puzzling. Perhaps I shall find the answer in No Man's Land.

'Good-bye, dear girl. Don't think from the tone of my letter that I have forgotten how to smile (this is where real humour is found, for humour was always a twin to tragedy). But I am forgetting how to scoff. I suppose, though, that I haven't changed beyond recognition, for I believe behind my back I am called "the Duke."

'Like my comrades, I have written to a loved one at home.

'I trust, Vera, that it is *Au revoir*.

'DENNIS.

'D. O. Montague, Pte. No. 673,895,  
'Brindle's Battalion, C.E.F.'

'Four minutes!' Lieutenant Gray, the youngest of the Brindle subalterns, stood watch in hand, his back to the parapet. Half-a-dozen rifles spat at the German trench opposite. The attack was to be a surprise, without preliminary artillery fire.

'Three minutes!' There was a slight catch in the subaltern's voice as he watched the ominous course of the hand of his watch ticking off the seconds. A signaller looked up from his phone. 'O.C. wants to know if everything is ready.'

'Two minutes! Has every man his gas-helmet, water-bottle, iron ration? Right. Tell the O.C. everything's O.K.'

'One minute!' Every man crouched for the spring—there was a mumbled prayer—a curse—a laugh. Montague took a deep, quivering breath, and his trembling hand felt for the bayonet-stud to see that it was firm.

'Come on, Brindles; give 'em hell!' Subaltern Gray leaped to the parapet, stood silhouetted a moment against the dull, cloudy sky, and, without a word, fell back into the trench a corpse. Cursing, shouting, laughing, the men scrambled over the breastwork, and were met by a torrent of machine-gun fire that swept through their ranks with pitiless accuracy.

'Something's wrong!' yelled Major Watson from the centre. 'They knew we were coming;' and he whirled around twice and dropped in his tracks. Montague leaped forward with a hoarse, inarticulate shout when he felt a blow on his arm as though it had been struck by a red-hot iron. He fell, but rose immediately, madly excited, muttering words that meant nothing. The charge had stopped half-way, and all about him his comrades stood irresolute, desperate, unable to advance, determined not to retreat.

'Come on,' shrieked Captain Greenshields, the adjutant, 'for God's sake!' And he fell, choking, vomiting blood, with a bullet in his throat.

Without an officer left, the men looked wildly about, the bullets spitting around them and taking their steady, merciless toll. With a great feeling of ecstasy, Montague staggered to the front.

'Steady, the Brindles!' he yelled hoarsely. 'Shake out the line to the left—cold steel, Brindles! Charge!'

'Follow the Duke!' roared a dozen voices; and they hurled themselves forward.

They hacked their way into the trench, but their triumph was short-lived. Things had gone badly on the left, and the signal to retire flashed along the line. With horrible blaspheming, the Brindles gave up their trench and started back for their own line. When he was half-way across a bullet struck Montague in the shoulder, and another in the thigh, and he sank to the ground unconscious.

When he awoke the moonlight was streaming over the stricken field. He bit his lip to keep from crying out at the sudden spasm of pain in his shoulder, and then something he saw almost stopped the beating of his heart. A figure was slowly crawling towards him, inch by inch, but steadily, ominously coming nearer with every moment. His left arm was helpless, and he tried to reach for his bayonet by turning over.

'Pard, are you dead?'

Never did sounds of sweetest music fall more gratefully on human ears than the words uttered by Private Waller on the night of October 16, 1916, on No Man's Land, Somewhere in France.

'Thank God!' cried Montague, his voice weak and quivering. 'Waller—old—boy.'

'Damn!' muttered Private Waller. 'The Germans, with customary fiendishness, were searching the ground with rifle-fire to prevent any attempt at rescue. 'Are you hurt much, pard?'

'I'm used up pretty bad,' Montague answered weakly, and in incorrect English. Things change in No Man's Land.

'I'm the third as has come after you,' whispered Waller; 'Sykes and Thompson got theirs.'

'Coming—for me?' Montague's voice trailed off into a querulous sob.

'Sure—those of us as got back shook hands on it that we'd get the Duke back dead or alive.'

Montague tried to speak, but only two scalding tears slowly trickled down his cheeks. He was weak from loss of blood, and he was learning a bitter lesson in the moonlight on the stricken field.

'I'll hoist you up as easy as I can,' whispered Private Waller eagerly, 'and I'll sort of crawl; and if they spot us, I'll let you down as easy as I can. Come on, pard.'

Fifty yards—that was all—but fifty yards of unspeakable agony. The blood flowed again from his wounds and matted over Waller's hair. A dozen times he would have fainted, but he grit his teeth, and crawling, grasping, falling, Waller took him to the edge of the trench. And then a bullet caught the little man, and he dropped.

'Good-bye, pard,' he said. So died Private W. Waller, of His Majesty's Canadian Expeditionary Force.

Almost a year later, a one-armed man was walking along a quiet street in the northern suburbs of a great Canadian city. He paused at a pretty little cottage that nestled in a well-kept garden to speak to a young woman whose black dress was mute testimony to her tragic bereavement.

'Ow can I ever thank you, Mr Montague,' she said, 'for giving me this cottage and going guardian to little 'Arry? And your wife, too,

is that kind and beautiful that after she comes here—and she is in and out nearly hevery day—I feel as if an angel had been 'ere. Well, if here ain't little 'Arry with his face all dirty!'

A sturdy little urchin stumbled forward, and in some way the one-armed man hoisted him to his shoulder.

'Hello, pard!' said Montague.

The little chap chuckled and pulled at his hat.

'I often wonders,' said the little mother, 'why you always calls him pard. Bill used to call you his pard, but I knew all along you wasn't. You was a gentleman, Mr Montague.'

'Mrs Waller,' said Montague, and his voice was very low and soft, 'I lay one night, wounded and dying, on No Man's Land. Your husband came for me, and he called me "pard," and he died for me. Perhaps you may understand a little of—what it means to me now.'

Tears, bitter tears, the heritage of war. Mrs Waller wept silently, and Montague's eyes looked past the garden, past the countryside, and saw neither trees nor houses, but a strip of land guarded by two wire entanglements, and two lines of trenches where men lived, and laughed, and learned, and died.

Fifteen minutes later the same one-armed man stood at a gate that gave entrance to a splendid lawn. It was his home, and as he stood for a moment drinking in the calm and peace of Nature at sundown, a girl emerged from the house and came towards him with outstretched hands.

Wonderfully happy, maimed, but filled with deep content, Dennis Montague, the man who had scoffed, went forward to meet his wife, who had had the courage to hurt the thing she loved. And the deepening rays of the setting sun spread a golden carpet for them to walk upon.

THE END.

## CAMPING IN LONDON.

By REGINALD B. SPAN.

**D**URING the course of many years of gipsy life in various parts of the world I have camped out in many strange places, generally far from the haunts of men and the frontiers of civilisation. For months at a time I have travelled in my wagon through the Rocky Mountains, the vast prairies of Wyoming and Colorado, the torrid deserts of Arizona, and the garden-like country of California; also 'carried the swag,' like any 'sundowner,' in the 'bush' of New Zealand; and have pitched my tent on the banks of rivers and streams seldom seen by white men, though the favourite haunts of Red Indians and Maoris.

From this wild life I went to the other extreme,

and lived for years in the luxurious hotels of the Riviera—at Monte Carlo, Nice, Mentone, &c.—where, at fancy prices, one can obtain all that an advanced and luxurious civilisation can produce.

In this time of war and stress I find myself in London. From hotels at four guineas a week, I turn my attention to rooms at four shillings a week. Too long had I tasted of the 'flesh-pots of Egypt,' and obedient to the cry of the 'simple life,' I was constrained to return to the primitive and natural. The idea of camping in London took my fancy; so, obtaining two attics 'with every convenience,' including the use of an excellent bathroom, at the modest weekly rental

of four shillings, I removed my 'goods and chattels' to the roof of a house in a pleasant residential locality near Kensington Gardens. I say the roof, because that is where my attics are situated, isolated from the rest of the house. There are fine views from my windows over the greater part of London, and I can survey the vast expanse of the heavens, the starry sky at night (with the prospect of hostile aircraft making further illumination), the gorgeous glow of the sunset at eve, and the delicate hues of the dawning day, just as I have observed the skies hundreds of times on mountains, deserts, and seas. There is no sound but the wind and twittering of birds in the tree-tops, and the rumble of distant trains on the Great Western Railway. Surely there is no quieter spot in London. At this spot one obtains pure fresh air, and all the sunshine that there is.

Outside my windows there is an expanse of roof bounded by a parapet about three feet high. Here I can sit and smoke unobserved, save by a stray cat, which makes the roofs its home. Puss and I are now great friends—an Ishmaelite and recluse like myself. On the sun-baked roof I spread my bedding each morning, just as I always did on the sands of the deserts or rocks of the mountains, after arising. When winter comes I shall perforce discontinue the habit, but by that time I shall probably have left my London camp, and facing the peril of submarines and inconveniences of foreign travel, have found another camping-place amid the palms and orange-groves of the Sunny South, beside the sunlit and ever-blue Mediterranean, where in times past I have spent many blissful winters.

The few things I have in my attics are very simple and inexpensive, and of the camping-out order—tables which fold up and come to pieces, camp folding-chairs and stools, folding camp-bedstead, light 'kopak' camp-mattress, warm travelling-rugs, and soft cushions and pillows. Sheets I dispense with, also linen of all kinds. My floors are bare, save for several Indian mats, which are light, cheap, and easily rolled up and carried. There are gas 'cookers' in both rooms, also gas illumination. A penny-in-the-slot gas-meter procures abundance of gas for cooking. My breakfasts are simple and easily prepared. In a few minutes water is boiled on one gas-ring for my cocoa or coffee, and on another eggs are cooked in my little enamel saucepan; a tin of sardines is quickly opened; then there are a couple of pots of jam, a plate of sliced ham, and a dish of fruit. No restaurant could give me better fare.

Lunch I always have out at restaurants. Tea, if I happen to be in the locality, is as pleasant in my rooms as anywhere else, and takes no time to prepare. There is only the water to boil on the ever-handly 'gas-ring.' A cake is kept in one tin, bread in another, biscuits of two kinds in others. Condensed milk and cream are

more convenient than the fresh articles, so I always keep them.

Dinner between 7 and 9 P.M. is too much trouble to cook, so I always have it in a restaurant, preferably one I know of in Piccadilly, where prices are not exorbitant.

I keep an abundant supply of water for washing and drinking in separate pails on the roof outside my window. This water I carry up two flights of stairs every morning. It reminds me of how I used to carry pails of water up to my tent from the waters of rivers, streams, and lakes in the wilds of the earth. I always took care to pitch my tent well above any water I might camp near, as being safer and more healthy. Once, in Colorado, I omitted the precaution, and in the middle of the night a sudden storm with a deluge of tropical rain caused the stream to flood my tent and carry everything away. I was glad to escape with my life. Kensington Gardens and Hyde Park are but a few minutes' walk, and thither I repair in the fine summer weather with my pipe and a book to while away an hour or two before wandering farther afield, to Kew Gardens, Hampton Court, Richmond Park, Virginia Water, Burnham Beeches, and the numerous delightful spots in and around the most beautiful and interesting city in the world.

To really know and appreciate London, one must explore it free and unfettered, with plenty of time and no limitations. To tie one's self down to an hotel or a boarding-house, where one feels obliged to return to meals at stated times, is fatal. I have my meals anywhere, at any time, and have just what I want, though quite simple and inexpensive. London abounds with restaurants where one can obtain refreshment at very moderate prices, well cooked and served in pleasant, clean rooms. Then for a change there are picturesque country inns, by 'forest, mead, and stream,' within easy distance of the metropolis.

In fine warm weather one can be out all day and half the night, returning to one's abode only when so disposed. During the wet weather I can stay in my rooms reading and writing, or go to the splendid reading-room of the British Museum, and read there till 4.45 P.M., with the largest collection of books in the world at my disposal, and a staff of civil, obliging attendants to fetch any book I require. This might not appeal to every one, but I confess I am a book-worm, and consider books my greatest friends and pleasure. There are, however, any amount of places of amusement for those whose inclinations are in that direction.

Visitors to London, as a rule, do not understand the art of living. They tire themselves with rushing about sight-seeing. They complain of the incessant and terrible noise and bustle, the crowded pavements, lack of sleep and appetite, and general fatigue, and soon get run down, and

are glad to return to the country. If they lived as I do they would escape all this, and find London an eternal delight, and remain in the best of health all the time. In my camp on the roof of a five-storied house I do everything for myself, and am not dependent on servants or help of any kind; and really one's little camp duties don't take long. A few minutes' application of a broom to the floor, water to fetch, the bedding to shake out and air on the roof, and occasionally one or two things to wash (so as to be more independent of the laundry), and one is free for the rest of the day. The bed is re-made, the kettle filled with water, and all made snug for nightfall; and, locking the doors, one goes off on one's travels, to return (if the weather be fine) only after dark.

The rest of the house is let out in unfurnished flats to 'quiet and respectable' people, who mind their own affairs and respect the privacy and rights of others. One has a latch-key, and can enter and leave the house at any time without questions or restrictions. A civil and obliging woman acts as housekeeper, and is ready to give

attendance when required for small payment. She looks after the letters and brings up parcels, and cleans the rooms—if required to do so. The landlady, who has four or five large houses near by, all let out in flats and rooms, lives in another of her houses in an adjoining street. Though she charges such small rents for some of the rooms, she makes the enterprise pay *well*; but she is a well-educated woman, with 'her head screwed on the right way,' and the sound, sensible, thrifty business ways of the Scotch. Others, not so well endowed with brains and tact, might try the same business and fail altogether. Personally, I have the attics as a permanent *pied-à-terre* in London. Whether I occupy them or not, they will serve as a good storing-place for my numerous books, pictures, papers, &c., which I have now arranged in shelves, &c., all round the walls.

This is my camp in London, to which I can return at any time from camps in other parts of the country—or world. My next camping-ground will probably be amid the sunlit splendour of the ever-verdant Alpes Maritimes.

## CHEROKEE ROSES.

By DOROTHY E. PAUL.

I HAVE great hedges of them in my garden, to the wonder of my friends, and the slight annoyance of my wife.

'I cannot think why you cultivate them, William,' she often says. 'They have hardly any scent or colour. And such thorns!'

I have never given her a reason. I feel that she would hardly understand why it is I prefer these white blossoms with their thick, heavily thorned branches; flowers that have neither exotic scent nor colour to commend them, but only a certain delicate, elusive perfume and broad, exquisite petals which surround a golden heart of close-pressed stamens. Yet above all other flowers I prefer these—Cherokee roses.

It was when my college days came to a close that I became possessed with a fervent desire to take up missionary work. I set aside a curacy, with a tempting hint of a speedy rectorship to follow. I had no wish to work in an already crowded field; I wanted to go out into the waste places of the world and take the word of the gospel to those that dwelt there.

So it was that, very raw, young, and inexperienced, but filled with zeal for my work, I set out for the vast and silent plains that roll between the Great Lakes and the Polar Seas.

I had a tedious and not too comfortable journey. When I had gone as far as 'steel' could take me, I had to travel the rest of the way by river. Not in a steamer or ordinary passenger-boat, but in a clumsy scow manned by an Indian and half-breed crew.

For transit in this scow I had to wait a week—there being no other mode of travel to Murray's Portage, my final destination—while it and others loaded up with provisions, mail, and trading wares, which they took twice a year up the great river to the lonely outlying settlements and the desolate trading-posts of the Great Slave Lake.

There were six scows in all, and I was a solitary passenger in the foremost, along with a crew of men whom I at first thought rather picturesque. But their manners and habits left much to be desired, and it was only at sunset, when they sang some old-time boating songs, adding a wild poetry to the scene, that they were at all romantic. I wearied of the unceasing chatter and quarrelling of the half-breeds and the sullen monosyllables of the Indian crew.

I felt no less out of place when I arrived at Murray's Portage. There was, of course, no one to welcome me, and none to give me a helping hand. I was a stranger in a strange country, where men glanced at me with indifferent or with alien eyes.

I was making my way up from the landing-stage towards the straggling settlement, when I became aware of a scuffling ahead of me, and the next moment I received a buffet on the face. I knew, of course, that the blow had not been intended for me, but I was tired and sore in spirit, and disposed to resent the fact that no apology was offered for the mistake.

'You might at least have apologised,' I said,

glancing reprovingly at the girl who had dealt the blow, which had, I saw, been intended to keep her male companion at a greater distance.

'You might at least have got your silly head out of the way!' she mocked, and in such perfect mimicry of my English accent that the man with her, a rough, loose-limbed fellow, burst into a guffaw.

That is how we first met—Rose and I.

Cherokee Rose some wag from the south had dubbed her. But whether because he found a resemblance between the petals of the flower and the girl's pale, exquisite skin, or because he had guessed that her rough exterior and sharp tongue guarded a heart golden and true, even as the long thorns of the branches guard their blossoms from the too rough hands which seek to pluck them, I cannot tell.

Scornfully she eyed me up and down. Weary and dispirited as I was, I could not fail to observe her beauty. Her skin was white and clear; neither rain, sun, nor wind had been able to spoil its flower-like delicacy. Thick, dark hair waved about her face; her eyes were gray and steady, matching the resolute curves of her red lips. She was dressed in the roughest of clothes, and wore moccasins on her feet. I took her for what she was, one of the 'poor whites' of the district. But my appearance evidently puzzled her.

'What are you?' she asked abruptly.

'I am a missionary,' I replied, wondering how this information would be received.

The man again burst into a laugh; the girl curled her lips.

'Do you suppose we want missionaries up here?' she cried. '*Doctors* is what we want!'

'I am a doctor of souls,' I answered, feeling my position keenly.

'Reckon you're too late, missionary-boy,' she replied. 'All the souls up here have got their tickets to Hell long ago!'

She turned from me and went up towards the settlement, her companion following. I heard them laughing, no doubt at my expense.

After one glance at the accommodation offered by the only hostel in the place, I decided to sleep under canvas until I was able to put up a cabin of some sort.

Luckily I had come provided with a tent, and it was while trying to fit it that I realised how thoroughly 'green' I was. Perhaps the strong wind which was blowing had something to do with my lack of success. I wrestled with that tent for over an hour, and it was when I was crawling for the fifth time from under the collapsed canvas that I saw the girl Rose standing near, watching.

'Should say you're used ter campin' out,' she cried, with a mocking smile on her lips.

I gulped down my mortification. I thought I detected a not unfriendly gleam in her eyes, and so I smiled and went towards her.

'If you'd help me, I'd be ever so much obliged,' I said.

She was won over at once. In a very few minutes the tent was pitched. She did, moreover, what I with offers of money had failed to do, and that was to commandeer a sulky Indian to go down to the landing-stage and fetch up my belongings. She went to the store and got me such things as were necessary, and that being done, she eyed her work with satisfaction.

'I can't thank you enough. You're a brick!' I said, holding out my hand.

She seemed pleased, and remained a moment or two looking in at the tent entrance. 'Say,' she began, 'what are you doin' up here, anyway?'

I explained why I had come, and the nature of the work I meant to do.

She looked sceptical as regards my power to perform what I professed. 'Reckon you'll find gettin' converts up here about as hard as growin' cabbages on the Portage,' was her remark.

I soon discovered she was right. The Indians alone I might have managed with some show of success had it not been for the evil influence of the white settlers. They had no time, these latter said, for 'Bible talk.' They jeered at my efforts, laughed at my failures, and enticed away those converts I might have gained.

For my own accommodation I had a rough shack built, cheerless and bare in the extreme. Adjoining it I had erected at considerable cost a barn which served as a chapel.

I held service twice on Sunday and two or three times during the week. The rest of my time was occupied in carrying the words of the gospel around the district and into the Indian cabins and wigwams—squalid, miserable places, where there was not a gleam of hope or comfort.

At the cost of strenuous labour I succeeded in persuading quite a number of people to attend the Sunday services. The poor, faded white women of the settlement were my principal congregation. Some Indians came, and they would squat in their rags and dejection on the benches at the back of the barn. They listened attentively, and those that knew enough English made some attempt to join in the singing.

I made no headway with the white men or the half-breeds. Among the former my principal trouble was Young Jake. Young Jake was the brother of Cherokee Rose. Old Jake, the father, was a drunkard, the son was a bully, and both were incorrigibly lazy.

Young Jake caused me any amount of annoyance. I realised at length that I could only hope to settle with him in the one way he would understand.

In the middle of a Sunday service he strode into the mission hall and demanded that one of the Indians there should go on with the work he was doing for him, and in threatening tones he said that I was keeping the man from this duty, which he had been paid to perform. I had

had sundry interruptions of this sort before. My blood was up. I refused to allow the Indian to go; moreover, I offered to fight Young Jake.

Outside a crowd gathered. I sickened at the thought of having to fight with this bully, but I realised he had to be punished once and for all. In height and weight he had the advantage of me, but I knew something of the science of boxing; therefore, after a few rounds, and at the cost of a swollen eye, I had reduced Young Jake to sullen submission.

The girl Rose, who was a spectator, glanced at me with a certain amount of admiration. 'That was fine,' she said.

'It was disgraceful—horrible!' I retorted, thinking of my interrupted service and of the pollution of the Sabbath Day. 'I came to preach, not to fight.'

'But isn't preachin' a kind of fightin'?' she asked.

'Ye-es; in a way it is,' I admitted.

As the weeks went by, and the bitter, immeasurable cold of the northern winter approached, my heart ached at the misery I saw around. I could not become accustomed to the sight of the shivering natives in their rage, knowing that they had but a few mouthfuls of food between them and starvation.

I bought food for them at the store, until the store-keeper warned me that supplies would not last till the spring, and that he could sell me nothing further. Then I drew from my own supplies, so that in the middle of winter I found I should have to go on very short rations until the spring thaw liberated the river, and the scows came up from the south.

Cherokee Rose discovered my plight. She came one day, unasked, to my cabin, to find me looking ruefully into an empty tea-canister.

'Been givin' it all away to them red fellows?' she inquired.

'They asked for it. I couldn't refuse; they looked so wretched,' I stammered in defence of my folly.

'Oh, they'd ask, sure enough,' she retorted dryly. 'They'd chew the clothes off you and not mind. Reckon you're a bit of a fool, missionary-boy. If you starve, who's to hold the meetings?'

'I sha'n't starve,' I answered. But my heart sank as I thought of my depleted store and the long, long weeks that must pass before the coming of the scows again to Murray's Portage.

I didn't starve either. Cherokee Rose saw to that. From her own supplies she kept me going, and would take no denial.

'Tisn't no good your comin' up here to save souls if you don't feed your own body, is it?' she argued; and I had to admit the force of her logic. In fact, she was right in most things. I don't know what I should have done without her help and advice during the first months.

I wondered why she did so much for me;

certainly it was not because of my work. She never attended the services; nor would she ever listen when I remonstrated with her upon her disregard for religion.

She was fully aware of her personal attractions. The men of the district had seen to that; and it was to keep away their unwelcome attentions that she wielded, with all the strength she had, her one weapon, the satire of her sharp and ready tongue.

Old Jake would have sold her for dollars to buy drink. Her brother often tried to bully her into alliances, from the very vileness of which it was his place to protect her. It was her own innate purity which kept her as she was and guarded her among her evil surroundings.

With the passing of winter my congregation dwindled. Outside attractions, hunting and fishing, proved too much for the faith of my proselytes. They came in sparse numbers to the mission hall, and I was forced to admit that the Indian is most often a convert when there is anything to be gained. In the winter I could give them warmth and food; in the summer they could get it for themselves. I was disheartened; my labours seemed in vain.

It was Cherokee Rose who helped me through this, my black hour.

'It's always the hardest work is the best,' she would say; and then, to please me it seemed, she would listen to my sermons, to my teachings and moralising, and all the while she was a hundred times better than I! I believe she detected the weakening of my purpose before I did, and tried to keep my former zeal burning within me. Without her encouragement I should have given in long before I did.

I looked forward to my second winter at Murray's Portage with a certain amount of horror. I dreaded the cold and the endless darkened days. The glamour which my missionary ardour had helped to wrap round the people I worked amongst was quite gone. I saw these people as they were—dirty, evil, hopeless. It needed a greater patience, a more enduring zeal, than mine to deal with them. I had not the courage. I was unfitted for the task. I could not go on.

It was while I was in this wretched state of mind that one day I got a summons to attend the death-bed of an Indian. The fellow who brought the message was a relative of the dying man, and although he himself refused to act as my guide and go back the fifty miles he had come, he implored me to make haste and go, as his relative could not die in peace until he had seen me again and heard me preach.

Then I *had* made one convert, after all! For a little while my former zeal blazed up, and I made ready to start on the long mad journey over the snow. By the time I had started I realised the folly of it, and only a kind of stubborn pride made me go on. In all prob-

ability I should never reach the place alive, as I had only the barest details of the way to go. I didn't care; in fact, I welcomed any enterprise, however foolhardy, to keep me from unpleasant thoughts about myself.

I was struggling on in a kind of blind desperation, when I heard a faint call from the distance behind. I stopped and glanced back. Some one on snowshoes was coming towards me. It was Cherokee Rose.

'I've heard where you're goin'. You're mad!' she cried.

'What business is it of yours, anyway?' I asked. It was the first time I had ever spoken roughly to her. She saw me then less of a parson and more of a man.

'Out here we make it our business when *cheechahos* like you go wanderin' out on the Barrens. Come back!' She spoke with stern reproof.

But I was filled with a dogged determination to go on, which, I fear, I regarded as a kind of martyrdom.

'I'm going,' I said.

'You can't go. You aren't fitted,' she cried.

'Oh,' I retorted bitterly, 'I'm tired of being a weakling. I'm no good, no good at all, I know. But I'm going. The man is dying; he wants me. I've never been wanted before! I'm going to him.'

With that I turned from her and went on. She followed me, whereupon I stopped again.

'Why do you follow?' I asked. 'You won't turn me from my purpose.'

'I know,' she answered; 'but I'm comin' to show you the way.'

I stared at her. Her cheeks were glowing; her gray eyes, steadfast and clear, sparkled as she gazed up at me. Little tendrils of dark hair escaped from beneath her fur hood. I had never seen her look so beautiful. Wholly a man was I as I stared down at her, and a kind of fierce warmth suddenly ran through my veins. For her sake I again told her to go back; I entreated, implored. She shook her head.

'Missionary-boy,' she said, 'you'll lose yourself out here. I am used to it; I know the way, and I'll show you.' She came nearer and touched my hand. 'I wouldn't do it for any other fellow. I can trust you.'

So she came with me. Together we travelled, and her companionship was sweet. Cheerfully she helped me over the dreary way, her courage inspiring me to further efforts of endurance.

When we reached the wretched *tepes* of the dying Indian, it was to find it was not so much religious solace that he wanted, but that I should give food and clothing to his squaw. When the man was dead I left what I could ill afford, entirely against the advice of Rose, who warned me we should need what I had parted with.

As in other things, she was right in this. It

was during our second day's return travel that a blizzard arose. In the teeth of blinding snow and cruel wind we struggled, making very little progress.

Very wretched, hungry, and almost frozen, we crouched for the night's shelter beneath a clump of dwarf pine. The girl somehow managed to start a fire, which added some comfort to our miserable plight. She cooked our wretched meal, bidding me swallow the hot tea. I felt useless and a burden. My frozen limbs refused to move; I was ill bodily and mentally, and had no wish but to remain where I was and die.

It was while we lay that night, close side by side for greater warmth, the one blanket covering us, for the other I had given to the squaw.

'Rose,' I whispered. The little face that lay so near my own turned as I spoke. 'Why do you do all this for me, when it is I who should be protecting you?'

She was silent for a moment, then replied, 'I guess it's because I feel kind of sorry for you. You must have given up a lot to come out here for us folks, so we owe you something in return; that's how it is.'

She *pitied* me! This daughter of a 'poor white' pitied me. I felt a stab of contempt for myself.

How we reached the settlement again I never knew, and afterwards I lay dangerously ill for many weeks. It was then I realised the truth of the girl's words, that it was doctors who were needed, and not missionaries.

Throughout my illness she nursed me, her only assistant being the rough young fellow whose name was Dave. Dave was the only man in the settlement she would speak to in a friendly way, and every one knew he loved her.

My convalescence came with the spring. When the scows came up the river I should go back with them. So I planned. For my work at Murray's Portage was done, or, rather, defeated—I was leaving the field.

It was when I went out for the first time since my illness that I heard the talk about Cherokee Rose. Evil tongues wagged because she had gone with me over the snow, and because she had nursed me since. Her father chose to consider his honour insulted. Young Jake was more foul-mouthed. I challenged him before every one. I was weak physically, and had no chance; but I challenged him for the liar that he was. He would have killed me had not Dave and some others more merciful come to my rescue. I had always to be helped—always, it seemed! But there was one thing I *could* do alone. I went straight to Cherokee Rose. When she saw me she knew by my expression that I had heard the slander concerning her. She lifted her head proudly, but did not speak.

'Rose,' I said, 'will you marry me?'

She looked at me for a moment; her eyelids quivered over her dear gray eyes; then she spoke.

'Missionary-boy, do you love me?' she asked.

Something within me thrilled at her words. Again that fierce warmth ran through my veins. She was my first love; I wanted her; I needed her desperately.

'Rose, Rose!' I cried, holding out my arms. 'I love you. Oh, my dear, I love you!'

Her arms crept round my neck as she came close to me; her lips quivered on mine. I shivered with the delight of a first embrace. Then she freed herself and stood away from me.

'Boy,' she said in a sad little voice, 'I'm not goin' to marry you.'

'Why not?' I cried. 'You love me, Rose. I love you, and I want you. You've helped me so much, and you're going to help me more!' I stepped forward eagerly to take her in my arms again, but she drew back.

'Yes, I reckon I love you, sure enough,' she answered quietly. 'It's because of that that I'm not goin' to marry you. I shouldn't be a help if I did. I'm not your sort, boy; and you know it.'

I hung my head in silence. She had pierced through the glamour of my protestations and seen right down into my heart; she knew what I proposed was impossible.

'What will you do when I am gone?' I asked her on the day of my departure.

'Me and Dave'—she began.

I felt a stab of jealousy.

'So it's Dave you really love!' I cried.

She shook her head.

'No; not in the same way. But he understands. He's been waitin' a long time, so I guess I'd better have him now. 'Sides'—She stopped.

But I understood. I knew she was thinking of the evil tongues which still wagged, and which I was leaving her to face alone.

'Rose,' I cried again, 'I wish you'd marry me. Come right away with me. You won't believe I love you; but I do. *I mean it!*'

'No, you don't,' she replied, smiling a little sadly.

But for once *I* was right and *she* was wrong. I did love her. I love her now.

In memory of her I have turned my garden into a wilderness of impenetrable thorny hedges, on which blossom pale, delicate white flowers.

I love them as I love her; and when the twilight falls upon my English garden, I have only to close my eyes to see again the sunset glories of the northern sky, the foaming of the river unloosened by the thaw, and the magic of the great, vast, silent land wherein I had laboured.

Laboured in vain, since I had gained no converts. But during the wind-swept, sweet spring days I had learned to do one thing thoroughly, to remember and love her always—Cherokee Rose.

## THE SHIPS OF ENGLAND.

'The first word is ships, the second word is ships, and the last word is ships.'—MR LLOYD GEORGE at the Guildhall, London.

WHAT is the Empire's foundation, the rock of Britain's might?

Ye ask in shame with bended head, and, heavens, well ye might!

We and our fighting brothers form the unshakable base,

The bottom rung from which has sprung your splendid pride of race,

We, the merchant ships of Britain, from Mersey, Clyde, and Tyne,

That brave the deep so ye may keep intact the battle line.

The lone Pacific knows us well from Yokohama Bay To the Strait Magellan crags round which the tide-rips play;

From Auckland, past the frowning Horn, with cargo frozen through,

Full fifty days without delays in calm and tempest too;

From China and Vancouver, through the Panamá's white heat,

Day after day we thresh our way that ye at home may eat.

Across the Indian Ocean, where coral-reefs abound, And the lazy, long-backed seas raise a soothing slumber sound,

With the flying-fish a-scuttling, the porpoise on the beam,

We forge ahead with awnings spread to join the endless stream

Of tankers, tramps, and troopships which flows by night and by day,

With ready help from bush and veld to say the War Lord, Nay!

Up in the frigid Arctic, where the seal and walrus play, And the polar bear and reindeer have undisputed sway,

Through the dark, awesome silence of the long, long northern night,

By berg and floe, in driven snow, like spectres, ghostly white,

We grope along the ice-bound ports that skirt the cold White Sea,

From peak and mast the frozen blast blows out your standard free.

On the great Atlantic highways we know each crested wave,

From Sandy Hook to Table Bay, back to the White Man's Grave;

We dare the blind Newfoundland Banks—our plaintive fog-horns cry—

By reck'ning dead and deep-sea lead we creep 'neath the shrouded sky,

And when the western wind whips up the great green seas astern,

Stagger home through the danger zone that ye may live and learn.

We are the bed-rock of Empire for which your fathers bled,

We stiffen the keel they laid, with our brave unhonoured dead—

We, the merchant ships of England, from Humber, Thames, and Tees,

Chance the blow of the unseen foe, we feed the unfed seas,

And our riven hulls lie rusting amid the weed and slime,

For we're the base on which ye place your heritage sublime.

J. VICTOR.

## SEVENTH SERIES

### THE OWL AND THE EXPRESS.

By E. H. LIDDERDALE.

IN TWO CHAPTERS.—CHAPTER I.

IF Robina Forsyth had been less solitary, or if day by day the express for which she used to watch had passed within sight of the silent old-world house where she had lived for so many years, she would probably have cared very little for it. It would have become as unromantic a part of her daily life as the punctual arrival of meals or the long hours when she read the newspaper to her father while he dozed. But though the railway passed barely two miles from her windows, it was invisible in the landscape, for it ran at the bottom of a deep cutting. Only the far-off rumble of the trains, and a faint wreath of smoke quickly melting over the fields, told where the highroad lay that links the bleak northern moors to London town, and through London even to the plains of France, to olive orchards and the blue seas of the magical South.

Robina came to Bonrigg when she was a tall, dark, vigorous girl of twenty. Her father had retired from a prosperous business career, and bought the place as a home for his leisured years. His wife had long been dead; he had no son; his elder daughter had lately married and settled in Glasgow. Robina was his obvious and predestined mainstay.

Old Mr Forsyth, as people even then called the gaunt and silent man, was by nature a solitary; in his eyes the aloofness of the house of Bonrigg was not the least of its charms. A low, irregular building of gray stone, it is set against a shallow cleft between the green sheep-hills of the border. On its western landward side, the long shoulders of the hills come close to it with their gorse and bracken, their little gullies whose dark foamy streams run twisting among hoary boulders. Upon its eastern side the windows of the living-rooms look into a small garden, where, after the homely Scottish fashion, flowers, vegetables, and small fruit grow together without partiality.

A low stone dike encloses the garden and separates it from the fields beyond. Three miles of level corn-land, broken here and there by a square of turnips as by a green carpet, and crossed by the invisible railway, lie spread between the old house and the rim of the

Berwickshire cliffs. Beyond the corn-fields the sea closes the view, its illimitable spaces contracted to a grave and distant floor.

It is a lonely country upon which the old house looks, and well-nigh as bleak as the open sea. The avenue of ancient sycamores which runs from the end of the garden towards the railway catches early in the year the parched and rusty look of wind-swept trees.

In the heyday of her youth Robina was not oppressed by the solitude of Bonrigg; she accepted the sober life she led there much as from childhood she had accepted her relation to a father who was never playful, never tender, sometimes irritable, yet not unkind. But gradually, as Mr Forsyth's unsociability increased with the lapse of years, Robina's sense of isolation deepened, and she began to suffer under it. The visitors whose appearances at Bonrigg her father had unwillingly endured became so irksome to him that she ceased to invite them. She lost touch with her women friends; men she never met, except at rare intervals in Glasgow. Her little niece Effie remained at last the only person whose presence in the house her father welcomed.

Slowly and without outward revolt, though with secret tears, the romantic, buoyant creature who had come to Bonrigg long ago was subdued to the efficient single woman: attentive, unexact, and cheerful by profession. Her neighbours saw in her a perfect daughter, a woman who had made without demur her sacrifice of youth and hope to age. A few there were who roundly called her father selfish, and in her inmost heart Robina did the same. But she ceased to think it when, in his ripe old age, Mr Forsyth had a long illness which left him frail and broken. Then at length he, who had never sought her affection by any show of tenderness, won her pity by his pathetic eagerness to survive, to regain his failing powers.

Secretly she laid her own strength at his feet, and the bitterness of her lot was transfigured by that final dedication. She could not, indeed, restore him. He tottered where once he strode: watched from the garden the

work of shepherd and ploughman. But he became easier to live with, and more lovable in his infirmity than he had ever been in his strength. Robina began to feel towards him as towards a child, and the knowledge that he looked to her for succour sweetened her monotonous round. Often in those years of the old man's slowly growing dotage the doctor said to her, 'He'll see his hundredth birthday, thanks to you!'

It was when the last glimmer of Robina's youth had faded that she began to find a strange satisfaction in the fleeting company of the London-bound express which daily passed Bonrigg in the late afternoon. At that hour old Mr Forsyth was dozing in his deep arm-chair after tea; she could safely leave him and take her walk, knowing that if he woke, Mrs Christie, her trusty housekeeper, would bear him company till her return. Usually she went to the hills, her first love; but as she grew older she more often turned her back upon these, and crossing the garden, slipped out at the little wicket gate in the dike, and so into the sycamore avenue beyond.

On either hand lay the quiet fields, beautiful at all seasons to her nature-loving eyes; far off the sea glimmered between the dark branches of the trees. The lane they enclosed soon emerged from their shade, and dwindled to a grassy path which ran between low stone dikes towards the railway, then turned and continued beside it, dropping to the level of the metals just where they issued from the cutting into open ground. There was here a curve in the line, and it ran sharply uphill for some miles before reaching the spot. Robina could hear the panting of the engine long before it appeared.

Often as she had waited for it at her trysting-place by the fence that bordered the line, she had never lost, never wished to lose, the leap of the heart with which she beheld the labouring monster round suddenly the intervening bank. Then to the engine succeeded the huge and sinuous body of the express, and gazing up, she scrutinised in hungry haste the faces at the windows as they flashed by her, the debonair groups round the little tables of the restaurant car. Sometimes she waved, and a passenger would wave back; and always she was greeted by the drivers, who knew her well by sight and looked out for her. She never saw the train dwindle and vanish in the distance without a pang of longing envy. These travellers speeding from all parts of the north to that friendly yet alien England she knew so little were not necessarily happy; she was too wise to suppose that. But they were alive, as she was not alive. Her life stood still; theirs went its changeful way; not without tears, heartache, hopes made vain, but surely with sunshine and adventure too.

The passing of the express filled Robina with a wistful pleasure which she never confessed to any one. It touched her imagination; seemed to link her for a moment, if but as a ghost, to the life of great cities and splendid enterprise. She would return less lonely than she set out. And if it were dusk the owl in the great sycamore beside the garden gate would be hooting, and the soft eerie sound seemed to utter afresh, as it had uttered for years, the passionless and static calm of her existence. Sometimes as she listened to it she fancied that she had heard ever since she was born that mysterious symbol of the gray, unchanging order by which she was encompassed. Nay! it was no bird; it was her own soul, resigned and solitary, that called to her in the silence of the avenue.

When the Great War broke upon Europe Robina read with wonder of the upheaval it had caused in quiet lives and places the most remote from the clash of arms. Amid much that was strange and terrible, this seemed to her of all facts the strangest, that not the least ripple of the storm troubled the charmed sleep of Bonrigg. By contrast with the harrowing fate of Flanders, life at home seemed to move with even greater placidity than before. She had not even to enlarge the subjects of her daily reading to her father. For Mr Forsyth was now, at ninety, childish, and had lost all grasp of current events.

So alone was she in her hopes and fears that at times she almost wondered whether the Great War were not a figment of her brain. She had long given up her rare visits to the neighbours, because Mr Forsyth was too old and fretful to bear any interruption of his daily round. His little meals must appear to the moment; Robina must be always at hand. And active service was denied her for the same reason; she could help her country only by her knitting, and—upon her knees. The enlistment of the Bonrigg cowman, and of Sandy, the big ploughboy, made the war real to her for a while; but it lost again the keen edge of fact when they were gone. Only the express brought her country's emergency before her in a brief and dream-like way, for now it was often late, and when it arrived was full of ruddy men in khaki, who smiled at her as they passed.

There came a windy day in March when the wind shifted suddenly, as it were, from some distant planet to her very door. It was her niece Effie who brought Armageddon to Bonrigg.

Effie was now twenty-two, a fine, sweet-tempered girl, whose buoyant energy recalled to Robina her own young self, though it was accompanied in the niece by a slightly complacent self-confidence which the aunt had never possessed. And she came from Glasgow trailing clouds of glory—a V.A.D., whose brother had

won the Military Cross, who for months had done her shift in hospital and canteen; had even broken down and been sent away for rest by doctor's orders, and was not unwilling to impress her aunt with the fact.

Effie was delighted to talk of all that she had seen and done, and to tell again the real adventures of real Tommies as confided to her by themselves. It alleviated the horrid dullness of Bonrigg to be able to thrill Aunt Robina.

But she was genuinely surprised when, one evening while she was treating Robina to a spirited instalment of 'Things Seen,' that lady exclaimed with a sort of trembling passion, 'Lucky Effie! Lucky girl!'

They were sitting in her aunt's old-world parlour, while in the adjoining room old Mr Forsyth slumbered with the door open, that they might hear him if he woke. The sunset had faded, and over the sea a little crescent moon was climbing the cold gray east. Robina had been gazing into the fire as though in a dream. Her sudden exclamation upset Effie's preconceived ideas both of Robina and of herself.

'Lucky!' she said, surprised, for she had not hitherto regarded the war-service of Miss Effie Macalister in the light of a frolic.

'Yes—to be young, to be free, to have so much to give!'

'Why, auntie, do you want to nurse too?' she asked.

It seemed to her impossible that any one aged fifty and 'a bittock' should harbour such longings.

'Well, suppose I did?' said Robina lightly, that she might screen her heart from those clear young eyes. 'Don't you think I might make a good nurse? After all, I've been grandpapa's nurse for many years.'

'Grandpapa's not wounded,' replied Effie with a touch of severity, as though she rather wished he were. 'Besides, you could never stand it, auntie dear; you'd be dead in a week.'

There passed before Robina a vision of the glorious lives laid down with laughter and a song, that she and her kind might draw their breath in safety. What had she done to deserve such a gift, who could not lift a hand to save them? 'Perhaps I don't want to survive this war,' she hazarded; and though she smiled, she meant it.

'I do,' said Effie succinctly.

They lapsed into silence, and Robina felt as never before the chasm that parted her from the young girl at her side. Hitherto she had adored in all simplicity the fair-haired creature who came to Bonrigg like some rare bird of bright plumage. Now for the first time she envied her bitterly; the splendour of Effie's opportunity cut her to the heart.

While she herself sat and knitted, this child had been plunged in the tide of the country's mighty effort; young, untried, hers had been the priceless happiness of answering, 'Here am I—send me!' to Britain's call.

Robina, too, at Effie's age had been in harness; but for whom had she spent herself from that day to this? For one whose heart had never leapt for love of her, and who had silently accepted her lifelong sacrifice.

Not for a moment did she doubt that her duty had lain, as still it lay, with her father. Europe might reel, but she must keep her watch lest he should drop his book, or the screen behind his chair need shifting. No outward call could remit her task.

But, quickened by Effie's presence, Robina's deep desire to minister to her country passed from mere longing into active pain. It was as though the voices of wounded men called to her by name.

And at their call the hidden fire of her nature revived, the romance which the gray years had starved and overlaid until she had thought it dead. In the passion which swept over her the young Robina lived again, impulsive still, yet disciplined, and wholly bent on sacrifice by the long habit of her soul. It was no excitement, no distinction, that she would seek for herself, as little Effie, for all her real devotion, sought them; not even the answering light of happy, thankful eyes; only leave to toil, to be spent, at length to fall and lie forgotten in the dust, that those she tended might live!

Robina turned away, and looked out at the darkening garden to hide from Effie the tumult of her heart. And as she did so she heard the hooting of the owl in the great sycamore, and the soft, persistent cry, monotonous as duty itself, seemed to her the passing-bell of all desire.

## THE CORRIDOR-EMPIRE.

### WHAT WOULD HAPPEN IF GERMANY WON THE WAR.

By WILLIAM J. HARVEY, Author of *Denmark and the Danes*.

THE single purpose of the German nation is the establishment by all means and at all costs of *Deutschland über Alles*. The character of her people is such that, even if she is defeated,

she will resume her methods of espionage and penetration in an effort to regain what she has lost, and ultimately to win that world-hegemony upon which she staked the issues of war in

August 1914. British people of all classes and creeds will do well to remember that it will take several generations to change the German character, deliberately trained as it has been for one express purpose—the creation of the German Empire.

A forecast of what would happen if Germany triumphed in this struggle would be open to the objection that political speculation has invariably proved to be one of the most unprofitable forms of prophecy. But a certain number of things, facts grave and sinister, and of serious import to Britain and her Allies, can be said with certainty; and it is to these things that the writer wishes particularly to direct the attention of those individuals in this country who, by their actions, would seem to value peace more than freedom.

If, at the end of the war, German militarism holds the field, undefeated, arrogant, and ambitious in victory, the Potsdam Junkers will pursue with renewed vigour and energy the dreams of *Deutschum und Welt-politik*, Germanism and world-politics. The military domination of Europe and Asia will have been secured, and the political stability and sovereignty of every other European and Asiatic Power will be menaced. The highways of northern commerce; the gates of the East; Egypt, India, our Southern Empire, even our African dominions, would be threatened. The Prusso-Austrian-Islamic Empire would be self-supporting, practically independent of blockade. Most threatening of all would be the vast land, sea, and air forces which would be necessary to maintain inviolate such an immense and powerful combine.

Modern Prussian policy has always been Turcophil, because a strong Turkey, Germanised and bolstered up, means that Roumania and the Balkan States can be easily controlled in Prussian interests. This policy, however, has its dangers. The peculiar position of the Osmanli in the Turkish Empire, and the fact that the political and religious capitals of Islam are not the same, has always weakened the central control of the Turkish dominions. Many millions of Mohammedans live in the British Empire, and are loyal in their adherence to it. But they are Osmanic neither by racial affinities nor by sympathy. In fact, the interests and sympathies of the greater part of the Mohammedan world are British. Moreover, the Arabs and the free nomads of Africa and Mesopotamia are not willing to surrender their autonomies in favour of a Prussianised Turkish overlordship. The real and natural protector of Islam is Britain.

Abdul Hamid, conscious of the fact that friendship with Germany would ultimately involve the political and military vassalage of Turkey, threw in his lot with Britain, and struggled for the independence of his throne and of Islam. Germany supported Enver Pasha and the Young

Turks. Abdul was dethroned, and since that day Turkey has been a tool in Germany's hands. The pompous journey of the Kaiser to Constantinople and Jerusalem has at any rate been justified by the success of its influence on German trade in the East, and the impression it produced in certain important Oriental circles. At the same time, the situation in the Turkish dominions is essentially mechanical and unnatural. It is opposed to the opinions of the greater proportion of the Islamic Empire, and it can exist only by means of a perpetual policy of frightfulness. It is a battle of Osman against Islam, a struggle between central autocracy on the one hand and federalistic and democratic principles on the other.

The people of Britain and the Allied nations should, therefore, remember that a Prussian victory will imply a reign of terror in the Balkans and in the Near East, and probably a holy war between the true followers of Islam and the politico-commercial adventurers of Constantinople.

Another fact of overwhelming significance to the future of democratic principles is the tremendous war-machine which would have to be created by the Central Empires to defend themselves from attack from without. The snaky frontiers of what we will term the Corridor-Empire, extending as they would across Europe and Asia, would be particularly vulnerable to local attacks and to depredatory raids. Therefore, Prussia, to maintain her powers of defence, would be compelled to put all her energies and resources into the service of the State. She would be always aggressive—always ready to enlarge herself by war. The present military-social war-organisation would develop into a permanent institution, and the world would live under the everlasting shadow of armaments and aggression.

The Ukraine, the most productive region of European Russia, already inundated by German agents and concessionaires, would fall into Germany's hands, and would become a wedge, cutting off Russia proper from her dominions in Siberia and eastern Asia.

Berlin would continue to rule at Bucharest. An Austrian writer, Dr Rusch-Reglin of Innsbruck University, has declared: 'The influence of German factions; the commercial relations between Roumania and Prussia; and strong pressure exerted by Prussia through and together with Austria, forced Roumania to become the unwilling opponent of the Balkan Confederation. *The Roumanian people will not be free until the Turks and the Bulgars are defeated.* Let the people of England remember that a German victory will mean the moral and political enslavement of the Balkan peoples, and their reduction to a condition of complete and ignominious vassalage.'

Austria, after the war, will present the German

politicians with their most difficult problem. Those who are competent to judge believe that, in the event of Germany's defeat in the field, the breaking up of the Dual Monarchy into its component entities may be taken for granted. In the event of victory the military caste of Germany will be faced by several anti-German factors which during the war have grown so powerful that only the most resolute repression will serve to keep them under. Court and official circles in Vienna are now largely dominated not so much by anti-German as Hohenzollern influences. The Catholic groups are violently opposed to Prussianism. The commercial and trading communities have realised to their cost that German industrial competition is rapidly destroying Austrian trade. Finally, there has lately grown up a considerable sentiment in favour of some form of rapprochement with Britain which would, it is alleged, enable both countries to force Germany to come to terms, and would free Austria from pursuing the wars with Italy and Russia.

What factors can Germany count on in Austria after the war? The influence of the powerful Magyar group is undoubtedly pro-German. There are also the so-called German Irredenta, the secret societies of Hungary, and the racial jealousies of that heterogeneous mixture of Slav, Teuton, Pole, Croat, Serb, and Czech which forms the Dual Monarchy.

No people in modern times have shown themselves so skilful at playing off one set of interests against another, or at deliberately creating disturbing and disintegrating factors in order to use them for their own ends, as have the Prussians. Militarism secured the temporary unification of all the varied and conflicting interests of Central Europe. Militarism alone can hold those interests together. If, therefore, Germany wins, it follows that the small nationalities living under the Hohenzollern wing will be condemned to a régime of perpetual repression and virtual martial law. It is the considered opinion of the writer, however, that Austria may yet surprise her Ally, and prove to be the burial-ground of Prussian hopes and ambitions.

The condition of Poland under Prussian 'protection' would be no whit less parlous than that of Roumania or Belgium or Alsace-Lorraine. The Central Powers in November 1916 undertook to create an independent Poland. At the time of writing they have abandoned their promise in this direction, and are negotiating with Austria-Hungary for a new partition. It is suggested that Poland shall be incorporated in a triple kingdom, composed of Austria, Hungary, and Poland. This scheme would, according to one of the leaders of the Polish party, 'strengthen the German element in Austria proper by getting rid of the Poles and Ruthenians.' It is quite unnecessary here to emphasise the fact

that the wishes of the Polish Nationalists have neither been desired nor asked for. It is proposed that the projected frontiers between the two empires shall be drawn from south to north along the river Varta in the former government of Kalish; then turn eastwards along the river Bzura, famous for its battles in this war; and then along the river Narey. The Austrians intend to unite Galicia with this new territory, and thus create the third party in their new empire.

If, therefore, Germany is not humbled on the field we shall witness the unhappy spectacle of the ancient and tragic kingdom of Poland being swallowed in the maw of a Teutonic-Turco-Austrian combination.

Another Prussian 'victory-aim' is to create a 'German-controlled Scandinavian Union,' the objects of which would be to secure the outlets of the Baltic, eliminate the Scandinavian Powers from that splendid sea-carrying trade of theirs which they have created by courage and ability, and to use their ports and railway communications from the west as a perpetual threat to Russia. The writer has seen a map of Europe, printed by one of the great Berlin daily papers, in which the whole of the territory from Calais in France to the Skager-Rack in the north of Denmark was represented as German.

Finally, Germany's victory would involve the permanent occupation of Belgium. Germany would fortify the coast, and Britain's dominion of the sea would be ended, inasmuch as she would no longer control the chief trade highways of the world, which all pass through our island waters. In these circumstances, Holland, with Germany on every one of her frontiers, with her ports and outlets watched by the tireless and all-seeing eyes of Prussia, would rapidly degenerate into a German province.

Upon Britain's efforts, therefore, and the efforts of her Allies, depend the fate of Belgium, Serbia, and Poland; the security of Scandinavia and Holland; the future safety of Britain, Egypt, and our African dominions. The Corridor-Empire, swollen by the ill-gotten gains of her treachery, would become the world-tyrant—terrible in military might, autocratic in diplomacy, treacherous in trade. She would Germanise by force. She would develop to even greater lengths that policy of 'peaceful penetration' which she has employed with such effect in the past against her unsuspecting and hospitable victims. In industry she would persist in that trade system which has brought her wealth and power—a system the symbols of which are *cheap production, cheap substitutes, inferior imitations, inferior value, smart jobbing.*

Mr A. D. M'Laren, the author of *Peaceful Penetration*, and a traveller and sociologist of repute, has studied and very ably described the German method of 'cadging trade,' a method

which, he believes, in common with others who know their Germany, would be intensified a thousandfold in the event of a German victory, and which even defeat will not entirely eradicate. His conclusions are so startling and so admirably put that we take the liberty of quoting them extensively. Mr M'Laren writes: 'As regards our commerce and industry it was warfare on scientific lines. In every quarter of the globe, but especially where the Union-Jack was flying, Germans were to be found as bankers, stockbrokers, merchants, tradesmen, clerks, mining and shipping agents, and artisans. They were all apostles of Germanism, and their activities and methods went far beyond legitimate commercial enterprises and exploitation. London, Liverpool, Manchester, Birmingham, Sydney, Melbourne, and many other large cities were honeycombed by the underhand methods of these secret agents and commercial spies. The German banks in particular were the foremost factors in developing Germany's commerce and industry along "national" lines. Take the Deutsche Bank, for example. The annual profits of the London branch from acceptances alone were about two hundred thousand pounds. Much of this business was, of course, legitimate. But it is now an open secret that the Deutsche Bank, like other German banks, used the trade secrets of its British clients to advance German interests. Every bill, every invoice, every letter that passed through its hands was closely scrutinised with a view to diverting business into German channels, with what success British manufacturers and merchants know to their cost.'

'Precisely the same thing was going on for years in the overseas dominions. Canada, Australia, and South Africa, to say nothing of India, have all suffered from the effects of peaceful penetration, from a political as well as a commercial and industrial standpoint. In the Dominions the Germans played a bolder, though still secret, and, to the British Empire, a more dangerous game. They gained control of "key industries," mining products especially; and partly by this means, partly by her admittedly superior scientific attainments and equipment, Germany was slowly but surely reducing Great Britain to the condition of an economic vassal. That this grave danger did not threaten Britain alone is proved by the unanimity of the Allied Economic Conference held in Paris in June 1916. Representing so many antagonistic interests, economically, there was yet complete agreement in calling for common action to put an end to the vassalage to which Germany was reducing other countries. *For Germany worked on a plan, an organised system.*'

One striking illustration of the German method and persistence in this direction came to the writer's personal knowledge. A certain German firm dealing in a special kind of engine of

inferior quality, but considerably cheaper than the same engine could have been produced in this country, obtained a small market in England for its goods. In a very short time the firm established repairing-shops here to deal specifically with its own engines. It sent over engineers, mechanics, and English-speaking commercial travellers from Germany to push its products; finally it built a factory in England, thus saving the costs of transport, and, by using *German labour*, was able almost completely to beat its English competitors out of the market. German newspapers were sent in great quantities to the neighbourhood; a colony sprang up; a German *Verein* or club was promoted; information anent commercial possibilities in the district was carefully collected, annotated, and despatched to the German Ministry of Trade in Berlin. Rivals were under-cut, 'side-lines' introduced, and in a few years that particular locality had been, in the term used by Teutonic politicians, successfully 'Germanised.'

This is only one instance of the German system. The same method was adopted in Austria and in every country where Germany desired that political influence should follow trade monopolies. In Bohemia, for example, the method has been attended with singular success, and the Bohemian factories now flood the Austrian, Hungarian, and Oriental markets with their goods. German clubs and *Stamm-birche*, which are small societies meeting in inns, restaurants, and such places, grew up, where business experiences were regularly exchanged, and ideas for future expansion discussed. Secretly these clubs developed an active political propaganda which has often seriously embarrassed and compromised the Austrian authorities.

One of the most influential of these so-called clubs is the *Schlaraffia*, which was founded many years ago by a rich Bohemian brewer, and which now has branches in every part of the world. Its constitution is said somewhat to resemble that of the Freemasons. Its members undertake to assist each other in every possible way, to find employment, provide information, and assist in the 'removal' of non-German competition. In return for this help the members of the *Schlaraffia* bind themselves to forward by all possible means the work of Germanisation. Although the club originated in commercial circles, its ranks now include members of all grades of society—officers, diplomats, professors, doctors, lawyers, bankers, and traders. It has also formed associations with other German propagandist clubs of a similar character, such as the *Allgemeine Deutsche Ritterschaft* (Union of German Knights) and the *Rosenberger* club. In the United States and in Southern America the *Schlaraffia* exercises a considerable underground political influence, although it is gratifying to note that in Brazil the club has recently received a severe blow, from which it is hardly

likely to recover. One of the outcomes of the *Schlaraffia* is the *Zentralbank Deutscher Sparkassen* (Central Bank of German Saving Institutes in Austria), a powerful combine operating in Bohemia and the Alpine districts of Austria and Hungary. It is a notorious 'centre' of pan-German propaganda.

Within the last few months a German-Persian Union and a German-Chinese Union have been established (*Deutsch-Persischer und Deutsch-Chinesischer Verband*). On 3rd April 1916, at the headquarters of the latter organisation in Berlin, a lecture, entitled '*Was Geht Uns China An?*' was delivered by an influential member of the Prussian Parliament, in which the lecturer claimed that German world-empire could be established only on a basis of an *overland* dominion extending from the North Sea to China by way of Turkey and Persia. The reasoning behind this suggestion was not only sound, but subtle, and deserves the attention of every imperially minded Briton. It is an idea which must be combated as vigorously and as strenuously as we are now shattering Germany's naval idea.

The speaker argued that the present war would be followed by an era of economic strife, and that many of the world's best markets would be more or less closed to Germany. In any future war the British navy would be able, even more effectually than now, to prevent raw material and foodstuffs reaching Germany from the Americas. A British blockade, however, could be rendered absolutely ineffective if Germany controlled the ancient trade highway from Europe to the East known as the 'Silk Street.' Persia and China could easily provide the legions of 1927 (the date of Germany's next attempt for world supremacy) with all the food, petrol, copper, and cotton required finally to establish the Teuton as the master of Europe and Asia.

It is known that at the present moment Germany is busily negotiating for valuable railway, canal, and trading concessions in China; that her system of commercial and political espionage has been strengthened and ramified throughout the whole of Siberia, in the Ukraine, from the Black Sea through Irkutsk and Teheran to the Far East; and that the powerful Siemens combine, which owns the rich copper ores in the Caucasus and in Armenia, has recently sent bodies of specially trained experts through Persia with the object of discovering and opening up new sources of mineral wealth. A mere cursory perusal of the *Veröffentlichungen des Reichskolonialamtes* at Berlin (Publications of the

Berlin Colonial Office) for 1916 is sufficient to prove that the German authorities are alive not only to the commercial possibilities of this new idea, but also to its *political and military value*, for these publications contain frequent reports of Asiatic exploitation, and point out the important results, commercial and strategic, which will accrue.

Two other facts only need to be mentioned here to prove the truth of this contention. The Hamburg-Amerika Line has suddenly revealed a suspiciously vivid interest in Persia, and has heavily invested money in certain Germano-Persian schemes. Finally, a prominent German economist, by name Quessel, has declared that Germany, by controlling the Asiatic market, can become self-supporting so far as cotton and copper are concerned.

Martin, the Prussian writer and privy councillor, in a remarkable book entitled *Berlin-Bagdad*, published in 1907, declared that Germany's future '*lies in Asia and in the air*.' Perhaps the most significant chapters in this book are those which contain a close and clever exposition of the strategical value of the region between the Altai and the Himalaya Mountains, known as the Gobi Desert. This region is spoken of as the 'key to Asia' and the 'central tableland of the Old World.' Martin states that were Germany to control this vast plateau it could be developed into the most formidable '*air-base in the world*.' A thousand super-Zeppelins could be stationed there. India could be threatened on the one side, Russia on the other. But Germany must be 'first in the air.' Then, and only then, will she be able to 'hold the principal overland route to the East,' and to 'establish her transcontinental empire.'

These are the facts. That German statesmen are contemplating a change of Imperial policy after the war is regarded in well-informed neutral circles as practically certain. The present writer recently sought the opinion on this subject of a responsible neutral politician, who said that 'a transcontinental empire from Antwerp to Shanghai would undoubtedly be Germany's reply to the decisions of the Paris Conference.'

For these reasons the Allies must fight on. The barbarism and litter of war must be cut out by the roots from the fabric of our civilisation. Germany must be defeated; for not until the mailed colossus is humbled to the dust will Britain sleep secure or the stars heave up and the lights flare out across unguarded seas.

## THE FORESTER'S GIRL

## CHAPTER XI.

FOR some time Gavin Barrie continued to thresh the water, though all his usual cunning seemed to have deserted him. He pricked his fish, tangled his line, broke his tackle, finally hooked a fine trout, only to let it scud away with his best fly. Not a muscle of his face, however, moved during this series of catastrophes; but finally flinging away his cigarette and reeling up his line, he did something, for him, rare indeed—sat down to think, the rod idly leaning against a tree, while the hours of the day best for fishing slipped unheeded away. For the life of him he could not get away from the thought of Anita. Was she happy—or going to be? Well, he supposed she must be. Why not? This forester of hers—he was well spoken of, and one of her mother's countrymen. True—true; and yet—

Back over the years flew Gavin Barrie's mind, and passed in review all the incidents of the first happening in his life that had really mattered. Vanished from before his eyes the towering trees, the running stream; deaf were his ears to the hammering of a woodpecker, to the scruff-scruff of scattered earth and the tearing of roots where the red-brown dog, with frantic paws and strong, white teeth, pursued his quest of some elusive beast deep entrenched. In their stead rose the white walls of a low, red-tiled house, enclosing a quadrangle of smooth green turf, of arbours veiled in roses, of cherry-trees in vestments of purest white. Small tables stood here and there beneath the open sky, and at one of these he saw himself seated, and in his hand a sketch, a fragment in sepia of the façade of the fine old cathedral at Amiens. He is regarding it critically, his mind lost in some detail not altogether to his liking, when a sweet, childish voice suddenly rouses him.

'*Bon jour, m'sieur. Que veut-il, s'il vous plaît?*' and looking up, he sees, standing under a canopy of drooping cherry-blossoms, a child of about twelve or thirteen years, exquisitely proportioned, *petite*, yet perfect, a short skirt of blue, covered by dainty frilled apron, revealing her beautifully moulded legs and tiny feet, while a bodice open at the throat, the short sleeves exposing slender arms fashioned as of wax, completed her dress. Her hair, blue-black against the snowy blossoms; her large eyes, dark 'like twilight fair;' and her mouth! Oh, what a living cherry of a mouth! That in itself, now impatiently reflected Barrie, ought to have identified her at once; never was so sweet, so red, so tempting a pair of lips as those of his little Anita. 'A mere child,' he had kept assuring himself, and the garden of the 'Rose d'Or' a restful spot after the hot, noisy place over which presided the ancient cathedral.

And so thither his steps constantly led him. Of small consequence that he must lend a polite ear to the reiterated platitudes of Monsieur le Patron. Enough that near at hand waited *petite Anita*, fetched his coffee, lighted his match, smiled at him, and tossed back with her tiny hand the soft black waves of hair from her smooth forehead.

The cherry-blossom dropped; the luscious fruit hung ripe and red; fluttering leaves shrivelled and fell. Winds and weather of winter-time drove tables and customers under shelter of the snug, warm inn; but of the grand old cathedral, the interior, as well as its noble façade, offers many attractions to an architect's pencil, and each recurring season found Gavin Barrie treading the streets of Amiens.

Anita was now already in her sixteenth year, but still a child in stature and dress, which suited well her slender build, when one day the Englishman, about to enter the well-known gate, came face to face with Harry Champion, an artist friend, brilliant but poor, warm-hearted but profligate, a roll of sketching materials under his arm. Loath to show him his small paradise and its presiding houri, yet unable to frame an excuse, Gavin invited him into the garden. Coffee was brought. M. Grossier served the new customer with something stronger, and began the usual flow of urbanities born on the tongue of your true Continental inn-keeper.

But Harry Champion favoured his garrulous host with but slight attention, and when, napkin over his arm, Grossier had hurried away for some fresh order, 'Look here, Gavin!' he exclaimed, 'why didn't you exhibit the little Venus before? Gad, man, you call yourself my friend, and here you've been hiding the very model that'll make poor Hal's fortune!—Come here, little one!' he called in colloquial French, and rising from the table before Gavin could interfere, strode across the green-sward to where Anita stood demurely waiting.

'*M'sieur, veut-il encore rien?*' asked the girl, retreating slightly as Harry advanced. Even after all this lapse of time Gavin Barrie, living over again that memorable afternoon, felt himself tingle afresh at the remembrance of how Harry Champion, without apology, placing his long fingers under the girl's chin, tilted back the beautiful little head so that he might feast his own bold eyes on Anita's soft dark ones, into whose depths a look of alarm had crept. At sight of this, however, Harry had removed his hand, and addressing her in tones of mock chivalry, asked whether he might have the honour of sketching her there and then. Anita had looked appealingly towards Gavin, still seated

at the table, and at his slight but encouraging nod the cherub-like face flushed rosy, the red mouth smiled and dimpled. 'Oh yes, if m'sieur so pleases.'

Champion held up a finger. 'Just where you are!' he cried. Then out came pastels and paper. The artist's genius held him, and beneath his fingers grew the miracle of his art. 'Voilà!' he exclaimed, flinging down his pencils and bowing grandly to Anita. '*Merci millefois, mademoiselle!*'—Now where the devil has that loquacious old rascal disappeared to? We'll drink a cognac on this, Gavin,' he went on gaily, tapping the sketch, 'and I'll make a bargain at once with the "pocket Venus" to pose for me. She's exactly what I've scoured Paris to find for my picture with David as cup-bearer to Saul. Now—why—didn't you—discover her—before, *mon ami?*' he asked with jocular emphasis, and punctuating each word by a sharp rap on Barrie's shoulder.

The latter had writhed. The last thought he could endure was that his innocent little Anita should become an artist's model. He hoped her father would interfere, for, alas! what right had he? He instantly resolved, however, to make the effort. 'See here, Harry,' he said, suppressing any anxiety in his voice; 'I consider myself by way of sponsor to the Rose d'Or, and to all the other flowers in the garden! So, if you propose borrowing cherry-blossoms, I shall claim the prerogative of protecting their bloom; and as a pledge that you agree, you must give me this sketch.'

Champion looked at him; but whatever it was he had meant to say died on his lips before the cool steadiness of Barrie's gray eyes. '*Mon Dieu, Gavin!*' he exclaimed lightly; 'I didn't know you were a poet! However, I suppose I do owe you something for introducing me to the sweet bud of the "Rose d'Or," and to monsieur's equally inspiring cognac. Better have a glass? No! Well, now to business,' he went on, setting down his empty glass and addressing Anita. 'Where's your father, little one?' And the girl hastened to call him.

In a brief moment everything had been arranged. Indeed, much to Barrie's secret indignation, Grossier made no demur. The pay was good; his daughter had plenty of time on her hands; monsieur could come and make sketches of her here; and in the autumn they were, in any case, removing to Paris, where the matter could be further discussed.

As to Anita herself, she seemed pleased; naturally flattered, doubtless, yet timid, and very grateful to Barrie, who, at whatever cost to himself, never failed to be the third at the artist's appointments in the garden of the 'Rose d'Or.'

As it turned out, however, Harry Champion, being by temperament first and foremost an artist, was so absorbed in the studies of his beautiful model that any misgivings Barrie had cherished by degrees subsided.

Then had come the removal to Paris, and with it the further step of Anita's constant attendance in Champion's atelier. An old servant who had cared for her since her mother's death took her there; but, early or late, rain or shine, it was Gavin Barrie who came and escorted her home. No saint was he, or Puritan; yet none ventured to chaff him about this young French girl whom, quixotically perhaps, he had pledged himself to protect. In the meantime Anita was fast growing into womanhood, the while her fame as the model for Champion's picture that won for him an enviable position in the Salon led to an eager competition among his fellow-artists to secure her services.

The realisation that this girl was rapidly drifting into the career of a professional model came to Gavin Barrie with a disagreeable shock, the more acute because, his own disinterested objections notwithstanding, he had no valid right to interfere with the disposition of Anita's life, or to remonstrate with her father for his ready acquiescence in her following a path so beset with dangers for a young and beautiful girl. Thus far the petals of the cherry-blossom which unconsciously he wore so near his heart had remained unsullied; he dreaded to think how soon over-eager or careless fingers might crumple and cast them away. Yet how to prevent it? and why? To neither of these questions had Gavin been able to find an answer quite satisfactory to himself, when a sudden summons home hurried him away from Paris.

Yet no sooner was he in England than an unbearable restlessness took possession of him; in his mind, day and night, was the image of little Anita left behind in the maelstrom of the great French capital, with no guardian except a callous and grasping parent. Should harm befall her during his absence, Barrie had felt he could never forgive himself. Worse than useless it was to upbraid himself as a fool, quixotic, un-English; useless the struggle longer to blind himself to what his own heart now told him only too plainly was the reason that the thought of the artist world acquiring this sweet child to make or mar was intolerable. How he cursed the wretched business which month after month detained him! What was the settlement of an estate and an added few thousand pounds to his income if the price of it should chance to be the ruin of *la petite Anite*? Granted that his own anxiety exaggerated the dangers to which she was exposed; granted, too, that he did injustice to his friends in the Quartier Latin; nevertheless, the spectre of Anita being pressed or induced to pose for—it was unthinkable!

When the first two flights of dark, draughty stairs that led from the street to the *étage* of Harry Champion's studio had been rapidly climbed, Gavin Barrie, his clothes damp and

clinging from the mist of a chill November evening, came to an abrupt halt as a sound of revelry greeted his ear—loud laughter, fragments of song, the clink of glasses. But why hesitate? His friend Harry was making merry, and never had Gavin been an unwelcome guest; he would open the door quietly and give him a surprise. Gently turning the handle, he stepped in, unobserved by the revellers, then suddenly stood stock-still as his eyes, growing accustomed to the change from the darkness of the stairway to the brilliant light of the spacious room, took in the assembled party. At a table of old black oak, in whose polished surface were reflected the sparkle and colour of wine and glass, sat Harry Champion and some half-dozen of his special friends—men, like himself, of undoubted genius but doubtful habits and views of life. With flushed faces and reddened eyes, they were at that moment raising their glasses to drink to the health— Oh God! yes, there could be no mistake. There, in the midst of these profligate men, her dainty figure but scantily attired as a bacchante, a wreath of vine-leaves crowning the thick clustering curls of her black hair, cheeks aflame, red lips parted, sat enthroned his little Anita!

Spell-bound, he stood for an instant an unnoticed spectator, contending waves of anger and pity sweeping over him, while a chorus of voices, half-insistent, half-threatening, began to urge something upon the girl, upon whose lips the smile was dying, the colour fading from her burning cheeks, a look of terror and supplication dawning in the great dark eyes.

Then, just as Harry Champion, rising heavily, pressed towards her, crying, 'She shall! She shall! Is Art to be denied a form as fair as Venus!' Anita, with a terrified cry, pushed back her chair, turned deadly white, and totter-

ing forward a few steps, fell fainting—into the arms of Gavin Barrie!

Crash fell the glasses to the floor as the party of merry-makers stampeded to their feet and stared in amazement at the apparition from whose clothing the smell of damp tweed mingled oddly with that of flowers and wine.

Harry Champion alone, in spite of his besotted condition, seemed all at once to feel the goading of his outraged conscience. 'Gavin!' he stammered—'I—I—believe me—as I'm a living man, not a soul has touched the child!'

But Gavin answered not a word. Silently, with two quick strides, he gained the door, carefully but swiftly descended the narrow stairway; out into the night air, tenderly pressed against his rough coat, he bore the fainting girl.

Thud—thud! Two great cones fell heavily to the ground at Barrie's feet, and here was 'Bob,' dirty and exhausted, but triumphant, bringing to him a wretched little gopher that he had at last succeeded in unearthing. With a start, Barrie came to himself. How unreal, how impossible, all that now seemed! How had he ever found the strength of mind irrevocably to sunder his life and hers? Yet even the callous old Grossier had been accidentally killed during Gavin's absence in England. The girl stood alone. There were her mother's dying wishes, and the American chaplain had been very kind, had arranged it all.

Gavin Barrie flung far the long-neglected cigarette that he had been absent-mindedly rolling, snatched up his rod, and, preceded unproved by the red-brown dog, limped back to the stream. But the birds and the running water and the sough-sough of the swaying pine-trees all sang together, Anita! Anita! Anita! 'Damn!' cried Barrie, and pricked yet another trout.

(Continued on page 197.)

## ANIMAL LIFE IN WINTER.

By the Hon. G. GRAHAM MURRAY.

**W**INTER-TIME is, in the animal world, the period of greatest stress and strain, and therefore Nature has allotted to her various children different means of supporting existence during these stern dark days. The intoxicating season of spring is the period of courtship, mating, and subsequent reproduction. Once the vernal winds do blow, then 'are the authentic airs of Paradise abroad;' and with the kiss of spring nature wakes anew to the full mystery of life. Winter is the season of inactivity, of waiting, of existing, and that all things come to him who knows how to wait holds true in the riches of nature.

The problem is then faced and solved in various manners, though man cannot always explain the why and the wherefore. To many animals

life continues pretty much the same, only with the added stress of the more severe conditions; but to others a complete change is afforded. One may say that three especial ways exist in the animal world of passing the winter. These are: (1) hibernation and the storing of extra provisions; (2) a change of coat, or the donning of winter clothes; (3) migration, or shifting of quarters.

The physiology of hibernation is quite distinct from that of sleep, though certain physical adaptations and changes take place also in the latter condition; and though the explanation of hibernation is far from complete, yet a few general statements may be given.

During this period of winter torpor many animals exist upon the reserve stores of fat, &c.,

collected within their own bodies, for hibernating animals show a distinct slackening of all vital functions. Thus it is only a question of keeping the machine from entire cessation. Consequently the minimum supply of fuel will achieve this. The heart-beats are feeble and irregular, the respiration faint and intermittent, whilst the excretion from the kidneys either ceases or greatly diminishes in quantity, the muscular reflexes are weak, and, in short, during hibernation the wave of life is at its very lowest both in quantity and quality.

With hibernating animals there seems to be a temporary loss of the normal warm-bloodedness; that is, the usual average temperature of the animal as in health is abandoned, and a temporary cold-blooded condition (about the same as that of the outdoor world) is assumed. During hibernation experiments have been made which recorded the sleeper's temperature as practically equal to that of the room where the animal was sleeping. The experimenter also affirmed that the vernal reawakening was not occasioned by the rising temperature of the outdoor world, but was due to some as yet undiscovered internal cause.

Another interesting point noticed was that during the awakening the body temperature rises rapidly, gaining in force until it reaches its normal height, this vital increase of body heat taking place without any vigorous movement on the part of the sleeper. Hibernation is, therefore, a very effective solution to the difficult problem of how to face the rigours of winter. It is a cessation of the daily struggle, affording a thorough rest for all the various organs and tissues. It is a present from Nature to some of her children who could not otherwise weather the storm.

The density or profundity of this winter torpidity varies. Some animals may be described as the heavy sleepers, others as the light. Again, some animals when they retire have accumulated their food-supply *within themselves*, existing on the fat of their own bodies. Others again have a secret cache of stores to which they resort at intervals of waking.

The more severe the cold, the sounder will be the hibernation, till the approach of spring bids the sleeper awake.

The bears are some of Nature's children who pass the winter in hibernation. The brown bears retire into winter quarters in autumn, and do not emerge until April or May, during which period the cubs are born (generally two in number). At the commencement of their winter sleep they are in splendid condition, but when they emerge it is with emaciated forms. The brown bear usually 'dens up' early in the season, making for itself a half-hut, half-burrow. This bear is found all across northern Europe, northern Asia, and again in the forests of North America (slight modifications occurring in the

different races). The grizzly bear is a very distinct race of brown bear, with a distribution peculiar to itself—namely, western North America. Whether or no the grizzly is a species distinct from the brown bear is a question of discussion among specialists. In the northern part of its range the grizzly bear hibernates, but it is probable that in the south it remains active throughout the winter.

The black bear of America is one of the lighter sleepers, whose period of hibernation is dependent on the external food-supply. The female, however, is forced to seek shelter early on account of the yet unborn young, which are dropped in January or February. The winter den of the black bear is a 'dug-out' beneath some fallen trees or logs, whilst a few leaves and bushes are scraped together to form a bed. If the cold weather sets in early, the den is usually a better thought-out and more thorough affair, which the snow completely covers over, and the bear is then literally walled in until the next spring. The black bear of the Himalayas is one of those animals which only partially hibernate. General Kinloch wrote that 'it passed a good deal of the winter in a state of semi-torpor, sallying forth from time to time in search of food.'

The hamster is another of the heavy sleepers. This is a yellowish-brown little rodent, about ten inches long, and common in many parts of Europe and Asia. During the winter the little hamster hibernates curled up in his burrow until the touch of spring awakens him, and then he refreshes himself from the secret stores of grain and other eatables which he collected before his winter siesta began.

The marmot is a small mountain rodent found in the Alps and the Himalayas. This little animal is considered to be the most thoroughly hibernating of all the mammals, since it lays up no hidden stores of food, whilst the long winter sleep appears to be unbroken.

The hedgehog and some of the bats are also heavy sleepers, hibernating throughout the winter; whilst the dormouse and the harvest mouse are among the light sleepers. The dormouse will retire within 'his cosy corner,' to emerge again whenever a spell of sunny weather occurs, for his is not a deep state of hibernation.

In the colder parts of its area of distribution the badger likewise sleeps through a portion of winter, though in Britain this hibernation appears always to be interrupted at shorter or longer intervals, according to weather conditions. In Sweden the badger is stated to retire in November, and not to reappear until the following spring, the mouth of the burrow being kept blocked from the inside.

The dear little squirrel indulges in winter naps, but not in true hibernation, so it accordingly keeps a plentiful hidden supply of stores in the shape of hazel-nuts, beech-nuts, acorns, &c. Likewise does the wise beaver, whose

storehouse under the water is kept liberally supplied with plenty of branches and spare wood, its usual table of diet, collected and carefully piled up during the autumn days.

Frogs and toads, as well as vipers, all pass the winter in a semi-torpid condition, the vipers congregating in small parties, and twining themselves together for additional warmth.

Among those frail children of the air, the butterflies, some species also resort to the lighter type of hibernation. The small tortoise-shell, the coma, the brimstone, the peacock, may all possibly be seen on a sunny day in midwinter, having awakened for a short spell of sunshine ere they turn again to slumber.

Thus to some of her children does Nature send her greatest gift of sleep as the means of solving the problem of how to face the rigours of winter. To others, again, she allots a different solution to the problem, and this time it is in a change of apparel, the donning of the winter coat.

What an immense boon it would be for us poor mortals could we but turn to nature to furnish us with our winter wardrobe! So many mammals grow a thicker and longer coat of hair or fur as a protection against the 'rude, roaring winds' of winter, this being especially noticeable in animals dwelling in Northern and mountainous regions. The fur of the snow leopard, for instance, is one of the thickest and finest of pelts, a magnificent protection against the piercing cold of those high and exposed regions where this animal dwells. The changing of the colour of fur and feather is yet another key to the puzzle. This peculiarity is exhibited by various Northern animals, but it is a different characteristic from the permanent white suit of so many dwellers in the North, such as the polar bear, the Greenland falcon, and the snowy owl.

There appear to be many advantages in a white dress for cold and snowy regions, for to those animals whose temperature is above that of the surrounding world, the loss of heat is less if the winter suit of fur or feathers be coloured white. This is a curious physiological fact which Nature turns to her account by clothing some of her children in white 'overalls' for the winter. Again, in snowy regions there will be the added advantage that this will be the least conspicuous garb, an advantage alike both when hunting and being hunted.

The acquiring of the white coat is wrought in different manners by different animals. With the stoat or ermine, which dons the white livery in place of the brownish-red coat of summer, this change is effected by the substitution of new white hairs in place of the brown pelt of summer. The change of colour for the acquisition of the winter coat has a distinct relation to environmental conditions, as is shown by those Arctic animals which at the approach of winter don a white garb in place of the darker

coat of summer. This change, however, is not universal to all the denizens of the Far North. Some of the mammals and birds retain the ordinary colour of fur and feather, whilst other animals, again, are garbed in white all the year round. The musk ox and the glutton, two well-known inhabitants of the Arctic regions, indulge in no winter suit; whilst the pelt of the reindeer is a mixture of brown and white. The polar bear and the Greenland falcon remain garbed in white throughout the year, as do also the snowy owl and the American hare.

Turning to those animals which acquire a white coat for the winter, we find the Arctic fox, the ermine or stoat, the American hare, the Hudson Bay lemming, and the ptarmigan. (With the Arctic fox and the Alpine hare the change is modified according to the latitude of their habitat.)

The ptarmigan, a close relative to the grouse, is found in summer with a light-brown plumage; but, as this bird inhabits high ground where the snow falls early in the season, it is of the utmost value to the bird that its plumage should harmonise with its surroundings. Hence the protective value of the white winter suit. This fact also applies to the Arctic fox, 'a true child of the North,' as well as to the other animals noticed; whilst the Scottish stoat in its northern ranges will take on the white coat for the self-same reasons.

With the American hare it has been found that the change of colour is effected without the shedding of hair. The entire process takes about three months, beginning in early October. With other animals the change is more rapid.

The third solution to the problem of winter life offered by nature is that of migration. It is at once noticeable that this course is offered to but few of the mammals. The caribou and some of the foreign bats are really the only mammalian migrants. Lemmings occasionally indulge in long treks, but these are not regular winter movements. It is the birds that really indulge in migration.

Considering first our mammalian travellers of such entirely different calibre, we find that the bats of Europe all hibernate throughout the winter, but the North American species (the *Vesperugo borealis*) migrates to a certain extent; whilst two species of Canadian bats regularly perform extensive winter migrations to avoid the intense cold of their Northern winter.

The barren-ground caribou, or American reindeer (*Rangifer grælandicus*), is found in the Arctic districts of North America, and in order to pass the winter in the forest regions this animal makes extensive autumn migration. So also does the Newfoundland caribou indulge in regular winter migrations. All who desire to study the journeyings of the latter should read Mr Dugmore's delightful book on the subject, a book of which the letter-

press is as charming as are the photographic illustrations.\*

But, as has been said, it is the birds who are the great travellers. The winter migration among them is undertaken in quite a different spirit from that of the spring migration. The latter is made when life is at its highest tension, when the breeding organs are all stimulated with the desire to mate, when the frenzy of love is in the air; then do the birds 'fly north again.' In the autumn they make the return journey, undertaken in order to escape the hardships of winter, with its attendant dearth and scarcity of food, and the absence of all insect diet.

There are, roughly, three classes of migration. No. 1 is migration proper—that is, travelling to different countries, the crossing of mountain and plain, the great journey. No. 2 is a modified route of travel. Birds from the northern counties will move to the south, crossing the border and in some cases passing on to the Continent. The skylark, the lapwing, and the rook may be included among the birds who undertake this type of migration, many of them leaving Britain for the shores of the Continent. No. 3 is a local shifting of quarters, the moving from wood to copse, copse to spinney, hedgerow to farm-yard. With type No. 3 we are all acquainted, and can see it any day in our parks and gardens. Certain birds are much more *en évidence* at certain seasons of the year than at others, and as they move to and fro from garden to hedge, from shrubbery to park, they are indulging in local migrations.

With migration No. 2 we have a more extensive system of travelling. Then vast flocks of birds will wend their way across the Channel, whilst others will content themselves with shorter journeying, leaving the valleys for plains, moors for the fields, or the hills for the shore.

The song thrush, for instance, is typically a bird which indulges in this type of migration. All through the summer this bird is seen in large numbers in north Perthshire; but at Christmas-time it is a *rara avis*. But once you move to a southern county you will see it daily. The same fact applies also to many other birds. The oyster-catcher, whose piping cry made such sweet summer music, has now migrated to the coast.

The golden plover, whose eggs were laid on the wild and wind-swept moor, has now moved to the low ground; whilst the curlew has also left the hills for the shore. All these journeys are undertaken in order to find more suitable winter quarters. This to most of our summer visitors means the great migration South. The great rush takes place chiefly in September and October (a few early departures commencing in August), and the journeys that are undertaken are of great magnitude. The swallow, whose arrival we so eagerly hailed in April or May, now wings his way to Africa, chiefly to the south of the great desert, and with him go a vast number of the little warblers, also bound for the African continent. These journeys are undertaken by night, the little feathered travellers banding themselves together in great companies all heading for the South.

I hear the cry  
Of their voices high  
Falling dreamily through the sky.

How these little voyagers undertake with safety such mighty journeys is one of the unexplainable questions. It is one of the shifts for a living that Nature offers to some of her children who could not otherwise weather the storms of winter.

*Quam magnificata sunt opera tua Domine  
In nimis profundæ sunt cogitationes tuæ.*

### 'REPORTED MISSING.'

IT was a bleak November evening, and the Macedonian valleys lying beneath me were shrouded in a white pall of rising mist. I was sitting before a brazier fire, and by the waning daylight was reading a letter which had arrived that day from Blighty. Among the little items of homely news, that hardly seemed important enough to have travelled so many miles, and were yet the more welcome for their very simplicity, there was a request. I remember it seemed a little ridiculous to me at the time: 'Could you make any inquiries regarding the fate of Lieutenant Ian Henderson?' He, a chum of mine, and the son of one of my mother's most intimate friends, had been reported missing for many months, and had, like such a vast

number of others in this great war, apparently disappeared absolutely from the face of the earth. As I sat pondering the matter, and wondering how I, a mere unit in this vast complexity of active army organisation, could hope to find out what the Records-Office itself had utterly failed to discover, there came to my mind a dim recollection of some rather strange circumstances regarding the disappearance of him who had been my chum. Ian had not been in the firing-line at the time, but was attached to corps headquarters, and had left there by motor-cycle on some special, but not dangerous, duty. He had simply gone out and never returned; nor had the machine he was riding been found. Doubtless every source of information had been examined, and every method of inquiry adopted, to get at the cause

\* *The Romance of the Newfoundland Caribou*, by Radcliffe Dugmore (Heinemann).

of his disappearance, but evidently without result, for at last he had been officially included in the great list of the 'missing, believed killed.'

We were at that time doing inglorious but necessary work repairing transport roads, and I was N.C.O. in charge of our little camp among the hills. A tent for us Britishers, and half-a-dozen for those of the motley crew of civil labourers working under us who did not stay in the neighbouring villages, comprised our little lonely camp, the position of which had been fixed by the proximity of one of the numerous stone-built Greek wells. The road we were working on passed close by; and about two kilometres off, over a saddle of the hills, there lay a village—a cluster of houses built of mud-bricks and rough stone, with low-pitched, red-tiled roofs; a mosque, from whose minaret a priest at the appointed hours called the somewhat unheeding faithful to prayer; and a schoolhouse, which, with the mosque, was the only building that boasted a pane or two of rude glass in its window-cases. A few tall white poplars here and there among the houses gave an Oriental aspect to the place, but within the village the picturesque was forgotten as one trod the narrow mule-tracks that served as streets, and breathed the atmosphere polluted with the stench of decaying rubbish.

Some few days after receiving the letter which I have mentioned, I was walking through this village with one of my men, on our way back to camp in the evening. The main road passed round the back of the place, but our shorter way lay straight through, or as straight as its crooked alleys would allow. As we were nearing the road again we passed a house which I had noticed before. It seemed of a better class than the others, although its outhouses, like many another building in the village, had been shattered by a shell during the last Balkan war, and it stood a little apart from its sordid neighbours, just enough to give it a somewhat exaggerated air of importance.

'Do you know who stays in that house, Tom?' I said to the sapper who was with me. 'It looks as if it belonged to the chief magistrate or one of the village head-men. It always seems empty, too, except for a big brute of a dog chained in the yard.'

'Yes, sergeant,' he answered, 'Aw know who stays there. 'E's a foreman in my gang on the road. That tall, dark chap that knows a bit of English. I can't mind 'is name.'

'Do you mean Costes Damis?'

'Yes, that's the bloke; 'e's workin' round the second bend beside the two willow-trees.'

I remembered the man perfectly, because I had taken special note of his manner more than once. He seemed always very interested in what was going on, and made use of his little English to pick up bits of information from

passing convoys. I had seen him, too, making notes in his own language. This I connected, however, with his work, and paid no special attention to it. He was a good man at his job, which was what most concerned me; but I was rather surprised to find that it was he who lived in the lonely house near the road. Had he no wife or children? Why was there no leaf of tobacco drying on his wall, or hen scraping in the yard? Only this ugly brute, half-wolf, half-dog, waiting his return in the evening.

We passed on, and the thought of the deserted house slipped from my mind.

It was late that night, and I was lying between my blankets inside the tent. My men were asleep, as their heavy breathing and a muffled snoring in the darkness told me; but sleep seemed to be very far from me. Outside, through the night, there echoed the dull sound of a bombardment. From the plain away to the north it came, a low monotonous rumble, punctuated with louder reports, that made one believe the dogs of war were in reality let loose, and that they were growling across the valley at each other in their immeasurable anger. I lay for some time listening, then crept quietly from my bed, unlaced the door-flaps of the tent, and stepped out into the night. In the distance I could see the serpent lights of some belated convoy gliding along the road, and hear the dull drumming of the motors as they climbed the endless hills. Beyond these creeping glow-worm specks there was the almost unceasing flash, flash, flash of gunfire. Here and there the configuration of some hill would appear, then be lost again in the darkness—a sudden, black silhouette of rock with one or two stunted trees growing on it. Again a strip of the river would catch a flash and become for a moment luminous in the distance, then fade, too, into the Stygian gloom of a moonless night. Around and through it all there came the angry rumble borne on the light wind from the bellowing cannon-mouths. I stood for some time gazing at this strange spectacle. Above me was the broad field of the heavens with its myriad stars, and the effulgent path of the Galaxy like a diaphanous band across it; stars and planets as they are never seen in the more dense atmosphere of the chillier North. Inspiring, horrifying, maddening, a thousand emotions seemed to mingle as I looked out over this so significant panorama of lights and darkness. I had stood thus perhaps about ten minutes. A motor-cyclist, with his little contribution to the drama of contrast, had passed on the road behind me; I heard the purr of his engine, and my mind seemed eagerly to seize hold of this little bit of tangible fact that swept past me in the gloom. A 'Douglas,' I told myself, as the sound diminished and died in the night. 'Signals,' for a certainty, with some urgent message. I turned

with a shiver, for the night was chill, and was about to step into the tent again to the welcome warmth of three thick army blankets, when I fancied I heard a footstep. I looked round quickly, but could see no one, so concluded it was a Greek labourer afoot somewhere in the camp, or a dog prowling around in search of a bone left from the last day's rations. I entered the tent, but still seemed to hear that step, closer now than before. It was no dog, but the tread of a man with, judging by the sound, heavy boots on his feet. I looked out again. I could see nothing for a moment, then seemed to discern a figure in the darkness. Seizing hold of a heavy stick kept for chastising vagrant dogs, I stepped out. The figure came closer, and I saw that it wore the uniform of a British officer. I challenged, but got no reply; and still the man advanced till he was quite close to where I stood, yet he did not speak a word. As he came up to me I got a glimpse of his features. They were strangely visible even in the deep darkness, and my heart seemed suddenly to stand still. I drew my hand over my eyes, and looked again. There could be no mistake. I knew my old schoolfellow's features too well to be deceived. I stood face to face with Ian Henderson or with his ghost.

There is a fear far worse than the fear of the known. It is the fear of the unknown. Had this figure spoken, had any vestige of human feeling come over the face, the spell might have been broken; but it only beckoned me silently, and, save for my throbbing heart, I stood petrified with a strange terror. At last, however, the beckoning figure took a pace or two away in the direction of the road. I still stood where I was, hardly daring to move, and it returned. I had made up my mind by this time that it was certainly an apparition, and no living man, I was face to face with; yet, if it was a ghost, it was assuredly the ghost of my friend; and the remembrance of the letter was with me. Here perhaps was the chance of getting to the bottom of the mystery of his disappearance. It was up to me to follow whither this figure led me; so, crushing down the feeling of fear that was struggling to get the mastery, I reached for my rifle, and slipping five rounds into the magazine, I slung it over my shoulder. Taking the stick, too, with me, I set out on this errand, fraught with such strange possibilities.

Up to the main road the figure went, skirting the nullah at the camp-side in a way that showed he either knew the path very well or had supernatural powers of vision to help him to thread the way. Along the sand-road we trod, he a few paces in front of me, and looking round much as a dog does from time to time to see that I was following. Behind me was the distant diapason of the guns; around me the black shadows of the nullahs, which at night-time seem to have no bottom; and in front the

vague possibilities of my strange adventure. Back we went in the direction of the village, where all seemed as still as a city of the dead. There in front of me was the lonely house I had seen so often, which seemed even in the darkness to bring itself insistently before my notice. Could it be the objective of this strange journey? Did it, with its almost obtrusive peacefulness, hold the key of this mystery? My mind was soon at rest. The doorway of the yard stood open, and through it passed my guide. Remembering the huge native dog that guarded the place, I grasped my stick more tightly in my hand; but within the walls, when my eyes fell on the beast, it seemed under a paroxysm of abject terror, and grovelled on the ground at our feet, a dark form with two fearful, tired, green eyes, then slunk away and hid itself.

It was to the heap of débris that marked where the outhouse had stood that the figure led me, and, still dependent on a silent pantomime, motioned me to move the stones away, as if it knew of something hidden beneath. I felt a deep intuition to obey this unspoken command, and began with feverish energy to remove the stones. Down I went, strewing the yard with the loose débris from the heap, till suddenly, in lifting an extra large mass of almost pure marble, I saw what seemed in the darkness to be something of the size and shape of a human hand. Gently I touched it with my stick, and felt that it was soft. Even in that village of stench, too, the smell told me that here lay a body many months dead. I stood up straight and looked round. My ghostly visitor had vanished. His work was completed. I knew.

What was to be done? I picked up my rifle, which I had unslung on starting my work on the heap of stones, and, acting on first impulses, I went up to the house door and dealt it some heavy blows with the butt-end. I waited at the ready for the foreman to come, meaning, I suppose, to demand an explanation about the body hidden in his yard; but no one answered me. Then it dawned on me that had there been any one in the house he would have heard me working in the yard. I crept to the nearest window and listened. There was no sound within, and making up my mind that I must do something, I entered cautiously. There were few rooms, but all were unoccupied, although in one there were the dying embers of a fire and the remains of a meal hastily eaten. I remarked, too, the unmistakable odour of petrol, and a rather curious profusion of empty motor-spirit tins. Of domestic furniture there was little—a rough table, a bench in lieu of chairs, and a bed. There was not much else, save that in one little out-of-the-way room I found a strong oak chest securely locked. The house was empty so far as human beings were concerned; the man was gone on some strange errand, and

I repeated involuntarily to myself the Biblical adage, 'They love the darkness whose deeds are evil.'

Carefully I made up my mind what course to pursue. I replaced the stones on the pile, and left it much as I had found it, then departed from this house, with its horrible secret, determined to return on the morrow when the man was at his work, and have a thorough examination. As I was walking back to camp, about the time of cock-crow, I heard the distant purr of the 'Douglas' again, and in a few minutes the machine and its rider passed me—an officer evidently, but wearing goggles, and so muffled up as to be unrecognisable.

Next day I gave the sapper in charge of Damis's gang special orders that this man was on no account to be allowed to leave the works; and when all were clear of the camp I set off with two armed men to the lonely house at the end of the village. As I drew near it my suspicions were strengthened, for I noticed I was following the track of the motor-cycle; but this I lost when we got to the rough stone causeway that leads through the village. We got within the yard of the house without being noticed by any curious inhabitants, and the dog was soon silenced with a bayonet-thrust. We entered the building and looked round. It was as I had expected. Inside one of the empty rooms, but so placed as not to be visible from the windows, was the Douglas cycle, and a British officer's uniform carefully covered with the man's blankets. We forced open the oak chest, and again our expectations were not disappointed, for we found war-maps, secret surveys, confidential documents, copies of orders, and a book with copious notes in a language not known to me, and some in perfect university English, besides a roll of new German 100-mark notes. I left a guard over the house, and sent a mounted messenger to headquarters for instructions. In the evening, when Damis returned, he found his house apparently as he had left it, but on opening the door was confronted by two gleaming bayonets. He drew back as though to escape, but by this time I was in the gateway of his yard.

'It's no good,' I said. 'You're caught.'

He did not lose his head. 'Me no compris, Johnny,' he returned, with a splendidly simulated vacant look in his face, and using the mixed gibberish of the native labourer.

'You compris just as well as I do,' I replied. 'You can speak English as well as write it. The game is up, and you are a prisoner here. Compris that, you accursed, murdering spy! You'll have to know English very well to explain how that heap of stones came to cover what it does.'

There was no vacant look in his eyes now. They told me that he understood.

It is a few months later now, and some time since I sent home as much of the story as I was permitted to send. Costes Damis was shot the next day; and a certain suspected British officer, who was seen once or twice by outposts in front of the line, has been seen no more. He confessed how he left his cycle in a wood, and how, wearing the uniform, he got through the lines; but that did not save him. A Greco-German, he had taken his chance and come out here, with the purpose of spying, which he had so long carried out, but—well, it ended suddenly against his own house wall, and he lies buried close by.

There is another grave where we laid what was left of the body of my old schoolfellow, with the usual inscription under a cross hewn out of a rough block of native marble. But Ian Henderson does not lie there in that blue and rotting human flesh; for I have seen him.

### THE AULD GAIRDENER.

THREESCORE and mair hae spun Life's peerie roond,

The saxties gaed my back the scholar's bend.

He's no deid auld wha hears ilk passing soond.

This spring I delved the yaird frae end to end.

I am the last, the hinmaist o' them a',

Wha in the bald strong years o' fifty-three

Took spade in hand—but noo the shadows fa',

And yont the mirk the angels compass me.

Yestreen I heard the laird and leddy's crack,

When I was thrang hand-weedin' 'mong the kale.

I hadna time to straucht my bended back,

When words cam' to me like the doomster's wail.

I canna gie her words the soople turn,

Nor airt them wi' the maister's easy flow;

But, oh, wi' dool within my he'rt they burn.

I've reached Life's lowsins'-time, and hae to go.

I hoasted when the sough o' sorrow fell.

They heard, and left me tremblin' on my knees.

Abune my heid I felt the sab and swell—

My father's faither planted a' thae trees.

The tane, as fades an auld time-withered flo'er,

In his last passing crooned the shepherd's psalm;

The tither, straucht as stands yon Border to'er,

Slipped hamewards wi' a simmer evening's calm.

Aft in his youthfu' days, on yae strong airm

I cairried him, the sair-misguided laird.

Noo, whae will skep the blithe bees when they swairm?

Ay, whae will maw that bonnie greenin' swaird?

I see the sun fa' westward braid and lang.

Dootless, like mony mair, I've had my day.

Oh happy bird that upward lifts the sang!

Ye seem to airt my very soul away.

Next morn the leddy left the big-hoose door;

The laird he daurna face he'rt-broken ire.

Wi' lichtsome he'rt she hummed a ballant o'er,

A sooth-made lilt new-fangled to the shire.

But where the whaups in circlin' passion sweep,

And brackens lift their forms in fronded grace,

She fund the auld man in God's hinmaist sleep,

Wi' God's ain sunlicht breikin' on his face.

GILBERT RAE.

## SEVENTH SERIES

### THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

THERE is a man in the world who is known to his own people and to many others as 'The Tiger.' The sobriquet is not the best to describe the characteristics of this man, but it serves. His facial appearance is very strong, hard, determined to a high degree; and a certain scepticism—a slight but very sardonic smile—plays frequently upon his countenance. It suggests to you always that he believes he is a man who knows the truth, and who perceives the proper way; that he, of his own volition and with his big determination, will act accordingly, despite all the intellectual harangues, the pretty sophistries, or the politest prattle that may be used to oppose his view; and that he will go through. It is indeed a great, strong face. The large, piercing eyes, with eyebrows slightly gathered and somewhat heavy underlids, are the main feature. There are long, gray, drooping moustaches, a strong chin, a little silver hair upon the head. In general the countenance suggests that this man through a keen life has toiled to his uttermost, and fought hard. He does not seem tired—very far from that; he is alive with electric, restless energy. Yet, as you look at him, you feel that he has discovered the world to be a hard place, and has few illusions about it now. Perhaps he made it as difficult for himself as he could, but no matter. More than seventy-six years of age, he has to undertake the hardest and most responsible task of his life; indeed, he is called to the rescue of his country, to lead one of the best nations the earth has known through darkness to its own salvation, happiness, and glory. One is writing, of course, of M. Georges Clemenceau, the Prime Minister of France. We have read lately in various French newspapers that nobody knows how he was first called 'The Tiger,' though the nickname has been attached to him for very many years and is in constant use; but that is surely wrong, for we remember an explanation being vouchsafed to us, and it seemed to be true. Some time ago, when the Combes Ministry was in power in France, two Parisian journalists, M. Vauxcelles and M. Pottier, were publishing in the newspaper *Gil Blas* a series of short, bright sketches

of the leading journals of the capital, and when they came to make their remarks on *L'Aurore*, which was edited by M. Clemenceau, they noted that this man, who had already gathered fame by his attacks upon Ministries, all and sundry, and had brought disaster to some of them, was behaving in a peaceful way, for the time being, and not indulging in any smashing tactics. So they wrote of him: 'M. Clemenceau is a tiger who has cut his claws.' The idea took the fancy of M. Buré, on the staff of *L'Aurore*, and when they heard M. Clemenceau entering the editorial apartments that evening, he remarked, 'There's the Tiger.' The change from the indefinite 'tiger,' with the small initial letter, to the definite 'Tiger,' with the capital, as it were, was important, because it established the name. From that utterance the name spread from the office to circles outside, and when the *Cri de Paris* began to make use of it in its columns it was fastened to M. Clemenceau for life. Perhaps it is no bad name for him, after all. He is the Tiger of France whom Germany fears more than any other man. The Central Powers saw their prospects fade and fade when all France last November performed the veritable miracle of acclaiming with mighty enthusiasm as the head of the Ministry this man, who by common consent was the best-hated statesman in the Republic. He had gone through his strenuous life making political enemies. His career had been destructive, as everybody said; he had cared for nothing and for nobody. He had an appalling record as slayer of Cabinets. The defence in the case was that, if he was commonly destructive, it was that which was bad that he always set out to destroy. However, there it was—no man had so many powerful enemies as he, and yet at the gravest crisis in the history of France the whole nation virtually called him to power as the only man who had the strength, the character, the deep sincerity, and the full unfavouring honesty to carry her through. He was the most thorough patriot.

\* \* \*

When he appeared before the Chamber a day or two later and made his statement, there was a most remarkable scene. There he was, the old Clemenceau, the scourge of fools and knaves,

as it was said, his wit cutting like a razor, his truculence as of old. He was there for France, which he loved, and for nothing else. He spoke of her, 'bloody in her glory,' and said that he, an old man, had nothing to gain for himself by being where he was. 'What are my war aims? you ask. I have only one—to win!' The Chamber almost shook with emotion, as this last phrase was flung upon it with a marvellous intensity of passion. And then, after a pause, he let loose a flash of the old sarcasm, remarking, 'And if I win, you may pass a vote of censure upon me.' Some time ago we considered briefly the question of who was the most important man in the world, and the conclusion arrived at was that it was the President of the United States. Clearly all that has happened since has confirmed the correctness of the decision, difficult as it is to adopt any satisfying standard or criterion of importance. But who, then, is the most interesting man? To be important is not to be interesting in like degree, to have a keen attraction for the public mind. Mr Wilson is interesting indeed. There is more of the gently human in him than was suspected by many; his statesmanship and his ideals are lofty. And he has peculiarities. To interest the people a man must be very human, very clever, and peculiar. Those are the three essential points of being interesting. Looking around us, over Europe and beyond, glancing upon all the figures that play their part in the enormous tragedy, we must admit that this war, so much greater than any other, has produced no such outstanding figures, such great characters, as might have been expected. Party politics have had a stifling effect. Men are not so fine as they should be. They have no brilliance of independence, and they talk, and merely talk, too much. Now, when the Allied Conference was held in Paris recently, and M. Clemenceau opened it, he made the shortest speech on record for a gathering of such transcendent importance. He said, 'Gentlemen, we are here to work. Let us work;' and so they went to work. When it is necessary he, too, can make long and noble speeches, orations with meaning and bite in them; but he is a great man of action. So, passing over the colourless persons who here and there have been doing the business of leadership in different ways, we come to this great, fearless, independent 'Tiger,' and if a vote of the world were taken, would it not be agreed that he is by much the most fascinating man in it? When we are told that these are the times when youth most counts, and when also it is said that wars discover new men and scrap the old, here we have the amazing fact that this most hated statesman, the most independent and the strongest, and one who was Premier years ago, is called to the leadership of France at her most critical moment at seventy-six years of age. Surely this must be an interesting man. His vigour, his impressiveness,

and his constant freshness make an alluring personality.

\* \* \*

Georges Clemenceau was born at Mouilleron-en-Pareds (Vendée) on 28th September 1841. He studied medicine, and then went to the United States in 1865, becoming a teacher in one of the colleges there, and marrying an American wife. That excellent Anglo-American writer, Mr George W. Smalley, once, in discussing the late Mr Joseph Chamberlain, said that for dominance of personality there was nobody to compare with him except M. Clemenceau, and that they had this in common, that each had married an American wife; and Mr Smalley added that, 'among all the gifts the gods have bestowed on the Englishman, his American wife is one of the most precious.' M. Clemenceau was for about five years in America, developed strong American sympathies, learned to speak English well, of course, and became a firm friend of the Anglo-Saxon race. When he returned to France he practised as a physician in Montmartre for a time. His keen patriotism had already had some political outlet. This young man, who, when only nineteen years old, had found himself in prison for shouting, '*Vive la République!*' with his arms round a lamp-post, was bound to be something in the political world ere long. In 1871 he was elected to the National Assembly as the representative of the department of the Seine, sitting on the Extreme Left. Municipal councillor in Paris, he became in 1875 President of the Communal Assembly. From 1875 to 1885 he was deputy for the Seine, and for the next eight years for the department of the Var. For a time after that he was out of Parliament, but returned in 1902, and in 1906 was Minister of the Interior in the Sarrien Cabinet. The same year he became Premier, and he had been in office for nearly three years when, after a famous oratorical argument with M. Delcassé, he fell on a question of naval efficiency. That, in extreme brevity, is the outline of his political career; but the chief features of it, after all, are not the offices he has achieved and his performances in them, but his attacks on other Premiers, successful attacks which have earned for him another nickname—*Tombeur de Ministères*. He caused the fall of many. When he smashed Jules Ferry he struck a blow at Germany, for Germany had been encouraging the French to mix themselves up in colonial adventures, with the likelihood that thereby they would get into trouble with Great Britain, and that thus their minds would be kept off Alsace-Lorraine. Jules Ferry, then Premier, was caught by the German trick. Clemenceau saw it and denounced it, and Ferry was finished. He disposed of Cavaignac and Freycinet, and, as he made Boulanger, so he broke him. It was understood that when Boulanger was made Minister of War he should do generally what

he, Clemenceau, suggested; but Boulanger did not carry out the bargain. Clemenceau called upon him at the War Office and said, 'You have broken your promise; I am going to turn you out!' And so he did immediately. And it may be added here that, skilful as he is with his tongue and with his pen, so also is he with the duelling sword. He has engaged in many combats of honour. M. Paul Deschanel is one with whom he has fought. Others, not now alive, include Drumont and Déroulède.

\* \* \*

In a career that seems full of special features there are two that are prominent. All his life he has been a great friend of Britain, a bitter enemy of Germany. His Anglophil sympathies long ago, when our understanding with France was, to say the least, imperfect, were much against him. The most stupid suggestions were made of intrigues that he was supposed to be having with us, and when he spoke in the Chamber he would be interrupted mockingly with 'Oh, yes!' in English. But he never budged, and never swerved in his belief that friendship with us was the best thing for France. All the same, he will have his little sarcasm even at our expense—or used to have. Once, many years ago, when he was in London, a discussion arose in the company in which he found himself upon the qualities most characteristic of the people of the two countries. Somebody had spoken of us as a practical people, and M. Clemenceau was asked for his opinion. 'I think,' he murmured, 'that the English are always practical when they get exactly what they want and have things precisely their own way.' As to Germany, he has more than once shown such defiance of her as no other French statesman. He was always contemptuous of the idea that France should ever for a moment be subject to the caprices of her neighbours. Just after a very severe crisis, when the Kaiser was making overtures again, and trying to be nice, as some people say, M. Clemenceau wrote in a paper he then controlled: 'What is quite intolerable is the pretension to make the whole world tremble when the Kaiser knits his brows, and to expect us to rejoice effusively when his Imperial Majesty condescends to favour us with a smile. The peace of Europe cannot be based upon the changeable disposition of this sovereign. To-day he is in a good humour; so much the better. To-morrow he will be in a bad humour; that is his own affair. For our part, we need a guarantee for our speculations as to the future which is independent of any one man.' This reminds us of his journalism, which is the second of the two special features just mentioned. Clemenceau has been one of the most powerful journalists in a land where journalists are more powerful and count for more than in any other. He first edited *La Justice*; then, after interme-

diat experiences, *L'Aurore*, in which he dealt vigorously with the Dreyfus case. In 1914 he started a new paper called *L'Homme Libre*, which met with such difficulties at the hands of the Censor—the whole of the contents except the title once being struck out—that he changed the name to *L'Homme Enchaîné*. In this paper day by day he wrote over his own signature a strong article on the situation, plain truths being dealt out broadcast. Of course, the paper, slight in other respects, was bought for this article alone, and it had a huge sale. This amazing veteran, who says he is aged but not old, is the most wonderful worker upon a system of his own. He goes to bed at eight at night, and gets up again at two in the morning, working thereafter until eight. At this hour, so much work done, he receives visitors. He lunches at eleven, and after spending an hour in the Bois, devotes the rest of his working day to his parliamentary duties and his newspaper. Or, rather, one should say that this was his working system before he became Premier again. The exigencies of his present office demand some variations. When the nation asked him to lead it again last November, one of the things he determined upon was that as far as possible the Press censorship would be abolished. Its stupid irritations, at all events, were to be dispensed with, and he specially announced that the newspapers could say anything they liked about himself and his colleagues, however offensive. And the morning after he became Premier his newspaper's title reverted from *L'Homme Enchaîné* to *L'Homme Libre* again. It was a pretty touch. But no longer is there the two-column article signed by Georges Clemenceau at the beginning of the front page. His name appears under the title as the *Fondateur* only.

\* \* \*

This remarkable man, almost without doubt the strongest and most independent figure in international politics for some decades, a marvel of sincerity and determination, brusque in manner, sharp in tongue, *fortiter in re*, but by no means *suaviter in modo*, may be described better, perhaps, in stories than in any other way. In Paris and elsewhere I have gathered some that are characteristic of him. At the time of the incident of Casablanca, nearly ten years ago, when Germany was disposed to show the mailed fist, Bülow was the German Chancellor, and Clemenceau was Prime Minister of France. Bülow summoned the French ambassador at Berlin to his presence and said to him, 'Monsieur, a German consular agent has been maltreated by your people in Morocco. Our honour demands that your Government should apologise. If you do not, we shall recall our ambassador in Paris. Go and tell that to your chief.' The French ambassador, faced with a tremendous crisis and the obvious fact that Germany was

bent on the very ugliest business, at once took train for Paris, and on arrival there proceeded immediately to the house of M. Clemenceau and told him what had taken place. The French Premier in turn summoned the German ambassador to come to him, sending him a brief note, in which he merely said, 'I beg you to come; I have something to say to you.' The ambassador, Radolin, hastened to M. Clemenceau, who repeated to him simply what the French ambassador had stated, and then, after a slight pause, exclaimed, 'Apologise! Never, sir! No apologies! And if you wish to leave here, nothing shall stop you. Leave immediately! Leave to-night, before they recall you! France makes no apology!' There is the spirit, and the pride, and the general policy of this wonderful man in that last proud phrase, '*La France ne fait pas d'excuses!*' On the morrow, upon the unveiling of the statue of Scheurer-Kestner, M. Clemenceau made a famous speech which stirred France like a single man. And some hours later Radolin sought out M. Clemenceau again, and conveyed to him the congratulations of the German Government upon his admirable discourse! Bülow had thought a second time. Once in the Chamber of Deputies, when Clemenceau was Premier, the Socialist Jaurès kept interrupting and questioning him very freely, until at last the Premier, in irritation, exclaimed, 'You are intolerable! You will not let me live!' Jaurès retorted that M. Clemenceau had done nothing all his life but worry Governments; to which the Premier responded, 'But I did not waste time, as you waste it, and because those others were wasting time I destroyed them!' On the occasion of the last election for the Presidency of the Republic there was much talk about the likely candidature of M. Dubost, the President of the Senate. Clemenceau said many sharp things of him, referring to his pretensions scornfully and in language not in the least polite. Some of these remarks reached the ears of M. Dubost, who one day, meeting Clemenceau in one of the corridors of the Senate, stopped him and said, 'Monsieur Clemenceau, why do you treat me in this manner? I do not really believe that you think I am more stupid than another.' 'Who is the other, anyhow?' answered Clemenceau, and walked away. When he was Premier ten years back he used to receive deputies and senators in his study, one by one, between eleven and twelve, for personal discussion upon points of importance that had arisen. A crowd of them would always be waiting in the anteroom, and as each one came out and made room for another, the audience being invariably brief, those waiting caught a glimpse through the open door of the Premier sitting on the edge of the table dangling his legs, as if in a mild fever of impatience that any time should be wasted. At twelve o'clock there might still be some waiting for their chance, and, if so, they waited in vain,

for the moment the clock struck the door opened, out came the last favoured deputy or senator, and M. Clemenceau, with a grim smile upon the others, called out, 'Time's up, gentlemen!' and closed the door in their faces. He could not be induced for the sake of politeness or consideration to vary the appointed programme and run the risk of neglecting other affairs that were waiting his attention.

\* \* \*

A good story of a different kind, showing the depth and the feeling of the man, is told by M. Paul Hyacinthe Loyson, editor of *Les Droits de l'Homme*. During the progress of the Dreyfus affair, this gentleman called on M. Clemenceau to discuss with him this great business, in which he, Clemenceau, was much distinguishing himself by the fine, vigorous, and outspoken articles he was writing upon it—as a champion of Dreyfus, of course. The scene was his study, looking out on to a garden, in which were peacocks, which M. Clemenceau was in the habit of feeding himself. There were not many objects of art in the room, but a Greek head of the fifth century so much attracted the attention of the visitor that he remembers its outlines well even to this day. He noticed also that the writing-table was of a very curious pattern, being such that the man who sat at it did not, indeed, so much sit at it as in it, for he got into the middle, as it were, and the table surrounded him, so that the utmost possible convenience was afforded him for having everything at his hand. The caller said to M. Clemenceau, 'All the big words that you write with capital letters in the Dreyfus affair—Truth, Right, Humanity—are they, after all, merely subjective notions of our own minds, or, on the contrary, spiritual realities? Are they will-o'-the-wisps or stars?' M. Clemenceau came out from his curious table, turned up the collar of his jacket, pulled down over his head the kind of gray travelling-cap that he wears indoors—instead of the velvet skull-cap affected by many other French writers who feel they have need of some head-covering when at work—sank deep down into an easy-chair, stretched out his legs, crossed his feet, and in the manner of railleury answered, 'Will-o'-the-wisps, young man; will-o'-the-wisps, and nothing else.' M. Loyson, who at that time was enthusiastic in his ideas, but younger and less sophisticated than he was later, was very much shocked and quite taken in by what was a pure affectation of scepticism. He did not know then that mockery was part of the nature of Clemenceau, and that he was giving vent to it on this occasion. But there was a sequel. Events had just induced M. Loyson to make a public profession of his faith, and on the following day M. Clemenceau wrote a letter to him which contained the following: 'You say some fine and powerful things to men whom fortune has confronted with a duty—one of

those duties which no man can shirk without dishonour. Each of them has done what he could, according to his abilities. I am very proud to be associated in your thought with this gallant band. It is impossible to have a noble idea without at the same time honouring one's country. And when a man has tried to do that, the consciousness of it is happiness enough; he needs no other reward.' And remarking upon this letter, M. Loyson says, 'There it was his mind which revealed itself to me; he shook off for the time being his nature, and silenced his sarcasm. For his sarcasm is really nothing but a modest veil behind which he hides his convic-

tions. At bottom he is a believer, not a sceptic—a constructor, not a destroyer. And if all his past, all his successes, seem composed of negations; if the path of his long career is strewn with the wrecks of the Ministres he has undone—Gambetta (1882), Freycinet (1882), Ferry (1883), Brisson (1885), Goblet (1887), Grévy (1887)—we may no doubt regret that all these victims have been Republicans, and some of them great statesmen whom the country needed; but we cannot deny that the man who brought them to the ground pursued his way, his programme, his principle with an inflexible logic.' We may leave it at that tribute.

## THE FORESTER'S GIRL

### CHAPTER XII.

IF traces of shadows under the dark eyes and a drooping of weary white lids betrayed to Gavin Barrie, when he and Anita met the next morning, how during most of the previous night, tense with conflicting thoughts, she had tossed about on her bed, the man himself gave no sign that anything had occurred to disturb the even tenor of their days at Grizzly Station.

Yet he, too, had passed a wakeful night, so filled with disturbing memories and reawakened longing for the unattainable that his low, white tent had seemed to smother him, and slipping out so quietly as to steal a march even upon his canine shadow, he had wandered restlessly up and down the dark forest aisles, vainly striving to reason himself back into a saner mood.

Anita was nothing—*could* be nothing—to him now. She was going to be married—soon—to one of her own race and kind; and even were she not, how could it possibly affect himself? He could not marry her—*would* not. All his fastidiousness and pride of birth arrayed themselves against such a suggestion. Yet he wanted her—wanted her—wanted her—with all the insistence of that side of his nature—the human, emotional side—with which he was ever at war. If only there were no such things, such des-

perately binding things, as law, and morality, and conventions—hateful, fettering conventions!

But, lo! the dawn was breaking, blushing coyly behind the great, dusky boles of the over-shadowing trees. A new day was beginning, and, thank God—yes, 'Thank God!' Barrie had exclaimed below his breath as, chilled and sore at heart, he re-entered his tent—Anita's forester was another day nearer due to come and take her away—away to her new life—the safe, uneventful life of the average married woman, a life so utterly diverse from his own that the marvel was that ever their paths had again crossed. Why should he grudge her the secure haven he himself could not offer, let alone permit himself to reawaken possible affections and longings for a world which she had irrevocably left behind her? He would keep out of her way; would hasten the plans for going farther into the mountains; would—would—and then at length he had fallen into a heavy sleep; woke to catch a glimpse of Anita in the morning sunlight; saw a troubled wistfulness in the eyes raised to his. All his resolves melted away. To-morrow the forester might come to claim his girl. To-day, glad to-day, should be *his*—and *hers*!

(Continued on page 217.)

## THE RHINOCEROS IN SIBERIA.

By Major J. SAMUELS, V.D.

AN interesting article on the frozen remains of the rhinoceros in Siberia, from the pen of the Rev. D. Gath Whitley, appeared in 1914 in the February issue of *Chambers's Journal*. He points out that the discovery of the bodies of these beasts on the frozen shores of the Arctic Ocean is 'opposed to all our notions of natural history,' the rhinoceros being a denizen of 'hot, steaming jungles.' He also discusses and disposes of all the suggestions hitherto advanced to

explain the phenomenon, including that of Pallas the naturalist, who fancied that this animal had 'lived far to the south, and that it was washed northward at the time of Noah's Flood.' From the condition of the body when found, and from the fact that 'the blood-vessels of the head were discovered by Professor Brandt to be filled with red coagulated blood,' the animal must have been suddenly drowned. The author of the article in question disposes effectually of the idea that man

exterminated these huge beasts, and says: 'The extinction of the rhinoceros in Siberia presents a problem most difficult to solve. We must remember that this extinction took place in comparatively recent times, and that the animal disappeared from northern Asia long after the appearance of man on the earth.' He also says: 'We are face to face, then, with a mystery, and it is clear that the extinction of the rhinoceros all over Siberia must have been brought about by some unusual and tremendous cataclysm, accompanied by an extraordinary change of climate. . . . Thus perished the Siberian rhinoceros in all its pride and in all its power, overwhelmed by a catastrophe both sudden and tremendous.'

In March 1908 the Academy of Science at St Petersburg despatched an expedition to excavate the remains of the mammoth that had been discovered near Kasachia in northern Siberia. The remains were in such an excellent state of preservation that a portion of the flesh was salted, cooked, and eaten by some of the scientists. The case of this mammoth is on a par with that of the rhinoceros mentioned by the Rev. D. Gath Whitley in his article. The frozen body of an antelope has been discovered within the Arctic Circle, and death had been so sudden that the food in its stomach was not digested. Spitsbergen and north Greenland at one time had a vegetation that included oaks, plums, chestnuts, and even the magnolia, whose leaves and fruit have been found in north Greenland deposits. All this shows that either the climate of those places has undergone a remarkable change or that the land itself has been displaced from a temperate zone. Many people are aware that professors of geology assert that at one period, called 'the Glacial Period,' this globe was smothered in snow and ice. The northern shores of Siberia eastward from the mouth of the Yenisei River are a solid mass of virgin ice, covered by only a comparatively shallow crust of earth! This fact has been ascertained by borings. After a certain thickness of soil, a solid mass of aboriginal ice is reached that extends to an unknown depth. Possibly on investigation the northern coast of America would yield a similar result. The Glacial Period is an acknowledged fact, but its cause is still a mystery. By what means the land surface of this globe has been broken up into its present form is another problem. The varied position of boulder stones, of all sizes from hundreds of tons to small pebbles, is a geological puzzle to-day. It is suggested that they have been carried to their present positions by the slow movement of glaciers during hundreds of thousands of years; also, that the land has been alternately submerged and raised (two thousand feet or more) through untold ages. We may, therefore, conclude that at one period of time the earth was covered with snow and

ice, and that some cataclysm occurred to scatter great boulders promiscuously over the land surface of the globe. A notable feature of this dispersion is that the larger boulders are found in northern regions, while their size diminishes as we go farther south. Again, they extend ten degrees farther south in America than in the Eastern Hemisphere.

It is quite evident that great changes have taken place during the time this globe has existed. The present writer, in his large work on chronology, suggested that all the land portion of the earth had been joined together round the South Pole, and adduced many proofs in support of this view. This idea may come as a shock to many, but it is supported by overwhelming circumstantial evidence. Geologists contend that many distant parts of the land have been at one time connected—South America with the Antarctic continent, Great Britain with France, &c. Naturalists can only explain the similarity of many species of animals in different parts of the world by asserting that they must have had some way of travelling across the sea. In the number of this *Journal* for April 1917 are two distinct articles, both supporting the view that the different parts of the earth were connected at one time. In 'The Mysteries of the Pacific' the writer says: 'The theory that a continent—of which Easter Island was part—once connected Australia, South America, and South Africa helps us on our way considerably towards the much-needed explanation of the mystery of Easter Island.' Again, from the article 'Australia: 'Take the remarkable fresh-water fish indigenous to Queensland rivers, *Ceratodus Forsteri*, the "lung-fish." The only two other discovered representatives inhabit the rivers of Brazil and tropical Africa.' The evidence that various parts of the earth have been connected at some period is too weighty to be put aside, but it does not seem to have hitherto been suggested that all the land was in one piece round the South Pole. Traditions from every part of the globe agree in stating that at the very beginning of all things the globe was nothing more than a waste of waters, and that after a time the land appeared in one block above them. All are agreed on this point, not even excluding the Bible. We read: 'Let the waters . . . be gathered together unto one place, and let the dry land appear' (Gen. i. 9). If, as the present writer firmly believes, all the land was in one piece at the South Pole, almost any problem that puzzles the scientist to-day can be solved. For example, it will explain why the ancient *native* Egyptians always declared that they originally came from the West, and that when they died they went back again; also their similarity in features to the Red Indian, and why they represented themselves red in their paintings. Again, the resemblance between their architecture and that of the ancient South Americans can be under-

stood. Ornaments, distinctly Chinese in origin, have been unearthed in Mexico from ruins so old that the Chinese can never have heard of them. In fact, the evidence that all the land in remote ages was joined together round the South Pole is, as before said, overwhelming.

Assuming that it was so, then some sudden catastrophe may have taken place that caused intense cold to fall upon the earth.

It has been said that if the sun were to be blotted out for a few minutes the atmosphere would condense, and the earth would be covered with snow and ice a mile or two in depth!

A disaster of a somewhat similar character is probably what has occurred in the dim past. Even the Bible infers that Noah's Flood was not the first catastrophe that has engulfed the globe. In the state of affairs here presumed the north parts of Europe, Asia, and America would have been on the fringe of the ocean, and near the Equator; consequently moist and hot. Any animals, such as rhinoceroses, &c., living in that part would, in the event of such a cataclysm, have been frozen in a few minutes.

But, the reader may say, this suggestion does not explain how the frozen animals have been found at the extreme north. Quite so, and the earth would remain in silence for possibly many ages, until the sun at last would begin to melt the ice and snow in a certain latitude as the earth revolved round the sun. Does not the Bible say, 'And the Lord God planted a garden' (Gen. ii. 8)? A certain portion would again become fit for man, and there would be no need of rain, for the melting ice and snow would cause mists to rise and moisten the newly uncovered land (Gen. ii. 5, 6). The evidence of Antarctic explorers to-day is that the distance of the ice fringe from the Pole is continually decreasing. We may recall that Adam and Eve, when turned out of the 'garden,' made themselves clothes from skins of beasts. This shows that they went to a colder climate. Let us now consider the way that the land became broken up into its present form.

Professor Lowell in 1909 caused a good deal of consternation in the United States by predicting that a collision would some day take place between the sun and a dark star. 'When that collision occurs,' he said, 'there will be a general upheaval of conditions on the earth, and if there should be any survivors of the disaster, night and day would be about the only feature of the present order of things that they would be able to recognise.' Now, if scientists expect such things in the future, why may not similar occurrences have taken place in the past? It is a recognised fact that the axis of the earth has been altered within comparatively recent times. The old philosopher Anaxagoras informs us 'that at the beginning the stars were seen as if carried round in a vast dome, in such a manner that the constant apparent revolution of the heavens was

vertical to the earth, and the inclination which it now has was received at a later period.' Herodotus informs us that the Egyptian priests told him that twice the sun had risen in the west and twice set in the east. If the earth has at one time been capsized (as the writer believes), that is what would have happened. The sudden wrench would disintegrate the whole land and cause it to slide into its present positions. As the globe completed the revolution, and with diminished violence recovered its former position, or partially its former position, there would be little displacement again after the first shock. It will be noticed that all the continents are pear-shaped, with their smaller ends stringing out towards the south. This is quite natural, for the heavier parts would leave portions trailing behind. It will also explain why the larger boulders are found in the north, diminishing in size towards the south. The northern end of South America would be torn away from West Africa below Guinea. When all connected together, New York would fit against the bulge of North Africa, while the east of South America would double up along the coast of the Antarctic continent, Chili and Peru would place themselves against California, and Greenland would fit in between America and Europe. This would explain the identical character of remains in France and Greenland. As a consequence of such a disaster, land in places would be squeezed up and so form mountain-ranges. This would account for fossil remains of marine animals being found in high altitudes. And so on for the remaining portions of the land all over the globe. Now, when the earth's axis was tilted, in however small a degree, an entirely new heaven would be presented to the inhabitants who had survived. Plato recounts that the Egyptian priests told Solon that the convulsion that destroyed Atlantis took place nine thousand years before the time they were speaking. This was about 560 B.C., and, when properly reckoned, the nine thousand years yields a result that places the date at about 2400 B.C., a date that is close to the one given for Noah's Flood in the work on chronology previously mentioned. Moreover, we have similar testimony from Central America to the same effect. The Troano Papyrus gives practically the same date—eight thousand and sixty years from the time it was written.

Such a disaster is what St Peter inferred when he intimates that the old heavens and earth were destroyed (2 Peter iii. 5-10). His words also seem to suggest that in all probability the statement made by Professor Lowell will become true in the future. Isaiah, again, also suggests a future cataclysm when he says the earth shall 'reel to and fro like a drunkard' and be 'removed like a cottage'—that is, shaken or blown away like a tent by the wind (xxiv. 20). If this predicted catastrophe should take the form of a reverse action, then

we can find an explanation for Rev. xxi. 1. There would be an entirely new map of the stars, and the earth being again all joined together ('a new heaven and a new earth'), there

would be to all intents and purposes no sea; that is to say, there would be no necessity to cross any water to communicate with the rest of the world.

## THE OWL AND THE EXPRESS.

### CHAPTER II.

IN the light of her unrest, the letter which reached Robina next morning appeared not so much an invitation as an answer.

'Our wounded are still pouring in, and I am short of ward-maids and nurses, and simply don't know where to turn,' wrote her old school friend Janet Fraser, now matron of a small military hospital in London, after a silence of many months. 'If you could run up and help us, even for a week, you would get a warm welcome and heaps of work, and I should be so thankful. But of course I know you can't.' . . .

The same appeal! Yesterday within her, and now from without. Robina folded the letter, and talked to Effie of indifferent things over the breakfast-table, while a plan as obvious as it seemed to her daring unfolded before her imagination: to steal away to London without explanations and good-byes, since she dreaded Effie's youthful disapproval even more than the astonishment of Mrs Christie, and for a brief space—a week, a fortnight at most—to live and labour for the war.

'Why not?' she cried secretly. She would leave behind a brief note of explanation for Effie, and beg her to devote herself wholly to grandpapa during that time. Grandpapa was well; the domestic sky was unclouded. And Effie had been only a week at Bonrigg, and had come for a month by doctor's orders. Robina's absence would, therefore, entail no change in her plans. True, Robina knew by instinct that Effie was not fond of grandpapa, but surely she would make this effort for love of her aunt.

The scheme was perfectly simple and feasible, yet it made the schemer's pulses race as though she were meditating some tortuous escapade. She went all the morning in a fever, shunning the too observant eyes of Effie, while dazzling opportunity and sober scruple fought within her. She could not tell which would win; she only knew that the thought of renunciation was unbearable.

Before the day was half over her excitement gave way to the almost fatalistic quiet of those who see that circumstance is on their side. A heavy shower had prevented old Mr Forsyth from taking his little daily outing; his bath-chair came to the door, and was sent away. To console him—for he showed disappointment—and to reinforce the drooping spirits of Effie, who, to the elder woman's concern, gave signs of having had enough of Bonrigg, Robina brought

out of the old man's desk the leather case which contained her mother's jewellery.

Whatever tenderness had softened Mr Forsyth's cold and unimaginative nature had been wholly centred in his wife. He had not greatly demonstrated his love for her while she lived, but after her early death he jealously locked away all her little possessions, and for many years could not bear to look at them. Robina and her sister were grown up before they had seen them, nor would he part with any of them, even to his daughters.

As his mind failed, however, he seemed to find pleasure in handling them more often. In spite of this, Effie had never yet beheld her grandmother's treasures; she was instantly restored to animation when Robina laid the precious case on her grandfather's little table. She came and sat opposite to the old man, and, hardly venturing to touch the trinkets herself, watched him turn them over with his frail and withered hands.

Robina left them together, and forcing herself to carry out her usual round, went away, and began to add up household accounts.

A few minutes later Effie ran to her, calling in soft excitement, 'Aunt Robina—look!' She was flushed and animated as, bending over Robina, she pointed to her bare throat, from which hung a splendid oval topaz on a thin chain. 'Grandpapa said, "Take it, Jessie darling; I bought it for you!" What does he mean? Is it for me?'

For a moment Robina was too much touched to answer. 'He thinks you are grandmamma,' she said tenderly. 'He used to say you were very like her.'

'Then what am I to do?'

'Just thank him nicely, and wear it—unless he asks for it back.'

Effie returned to her grandfather not a little moved. Hitherto she had not shared the common opinion which pronounced Mr Forsyth a 'dear old man,' chiefly because he tottered, and had a silky white beard. But now that he had given her this lovely token—even though by mistake—she felt prepared to modify her secret thoughts of him. The mistake itself was, indeed, of a nature to soften a feminine heart, since grandmamma had been a beautiful woman.

Robina, entering the room a few minutes later, found Effie sitting hand-in-hand with the old man, the great golden jewel sparkling against

her white throat. The fortunate effect of grand-papa's hazy gallantry was written in her happy and tremulous expression.

Robina went back to her own room; the little incident had suddenly quenched her every scruple. She was calm and perfectly resolved, and yet she felt that she must be alone. To-night! This very night, while her father was so gracious, Effie so visibly touched and mollified! Surely with luck, and with Effie's goodwill, this halcyon situation might continue! And as though to fortify her resolve, she began to pack a light suit-case which she herself could carry.

A slow train from Edinburgh passed the little station nearest to Bonrigg in the late afternoon. She would take this train to Newcastle, and there change into the first express that left for London.

A wonderful sense of elation grew upon her as she moved about the room; it seemed that destiny itself was favourable to the adventure. She stood a moment before her glass.

'So you are to be really alive for a little while like other women—like Effie,' she said to the tall, gray-haired woman whose dark eyes shone into hers. 'Effie thinks you old and humdrum—you are not! You are strong and young, and hold yourself far better than she does!'

She smiled and turned away.

However empty the coming years, this at least would remain to her, that she had taken her brief share of her country's burden, had felt the waves and storms of the Great War beating upon her. The fear that she might be hindered at the last moment from starting passed now and then like a swift cloud over her elation.

'But let this day, let this one day be mine;  
Let all the rest be thine!'

Robina knew the Elizabethans well. With the thought of renunciation the cry of her heart rose in the lovely, passionate words, and dumbly she pleaded them with the unbending necessity she had so long obeyed.

After many showers, the evening set in as quiet and windless as the corner where Mr Forsyth sat dozing beside the fire. Robina had given him his tea and settled him in his favourite arm-chair; then she had kissed him with more than usual tenderness, and stolen away to dress. Wrapped in a long, dark driving-coat, and holding her suit-case in her hand, she stood now for one tense moment outside his door, and felt rather than heard in the perfect silence the old man's regular breathing, the soft click of Effie's knitting-needles. Frightened by a sudden impulse to look at her father once more, and thus betray herself, she turned and stepped noiselessly away.

The sun had set, and a clear, pale afterglow rested on the bleak landscape between the hills and the sea. Robina skirted the house by a lane at some distance from it; she did not dare to go down the sycamore avenue lest Effie

should spy her from the window. Only when she had lost sight of Bonrigg did she enter the familiar path leading to the railway.

She walked slowly, because she had no need to hurry. Fairhill Station was only two miles off, and she knew that her own express must precede the stopping train. The former was not yet signalled, was not even due for another twenty minutes. She wished she could have travelled by it; she fancied it would have been pleased to bear her away. The prospect of being seen by it gave her strange pleasure. 'I, too, am a traveller!' she thought, and wondered when she had been last in a train.

Time being with her, she set down her suitcase within view of a signal, and leaned a while on the fence beside the line, waiting for her familiar friend. She was immensely excited; her hands were cold, her temples throbbing.

'Life is where they are going—where I am going!' she thought, following the gleaming rails southward with her eyes till they vanished out of sight. Already the landscape wore a new expression; the clouds resting in their glacier-like solidity upon the gray bosom of the sea, the fields where the light lingered, the sheep-hills growing black against the west looked at her as though they said farewell.

And then suddenly she wondered why the signal did not fall, and, taking out her watch, saw that the express was late. Since the war began this train had often failed to keep its time; its non-appearance should have made Robina only the more certain of catching the one behind it. Had it been up to time, she would have gone on, perhaps without misgiving, to Fairhill—to London. But the little delay now involved startled her. Trivial as was this faint check at the outset, it shook the determination which had urged her forward. It was like a barrier thrown suddenly across her way, where Duty stood sentinel, crying, 'Halt!'

She tried at once to dispel the sense of shock; she even walked stubbornly on towards Fairhill, but it would not do. With every step her uneasiness increased; the tumult of accusing voices grew louder.

'You are leaving him—and he is so old and helpless. What will happen when he finds that you have gone? It might kill him. . . . Will Effie be really good to him while you are away? You don't know; you can't be sure. . . . You are laying down your only task—what you alone in the whole world can perform—to please yourself!'

Almost without her volition Robina turned, and found herself hurrying towards Bonrigg. Not only duty urged her back; she was suddenly possessed by foreboding, by dread of some calamity unknown. In vain she tried to scold herself into common-sense; the nearer she came to the old house the sharper became her suspense. She dropped the suit-case in the avenue,

and stripping off her long coat, threw it down, that she might run better. And as she ran, she listened for the reassuring sound that would tell her Bonrigg was unchanged.

But that night the owl was silent.

Robina made good speed, but her terror outstripped her. On the threshold of the house she stopped, panting, incapable of speech. She knew already why Mrs Christie was standing there, in tears, waiting for her.

'Miss Robina! Miss Robina! . . . He's gone—while you were out—in his sleep.'

Robina tried to answer, but no words came. She walked past Mrs Christie, and dropped on to a chair in the hall; she was very near fainting. The touch of a shaking hand recalled her to action, and glancing up, she saw Effie beside her, looking very white and small in the dusk, and strangely inglorious for a V.A.D. of so much professional experience. They clasped hands in silence. But Robina quickly rallied.

'Where is he?' she said sharply, in a low voice. 'How do you know? Have you sent for the doctor?'

'Doctor Murray's here,' whispered Mrs Christie. 'By the Lord's mercy he was at the cottage, seeing after Jean Welsh's baby. He's with the master now.'

Robina rose, and went towards her father's room; there was that in her face which told the other women to let her go alone.

In the little sitting-room all was still—more still even than when she went out. Dr Murray had laid the dead man on the sofa, reverently shrouding the passive limbs in their old familiar shawl. He came to her now as she opened the door, and led her to her father.

'Be brave, Miss Forsyth,' he said gently. 'He's had the end we should all choose for ourselves, if we could.'

In a sort of dream Robina looked down at the old man as he lay, his features not more benign than they had been in life, but composed to unspeakable dignity. Then she heard herself ask how he had died, and as from far away the answering voice of her old friend.

She listened to it without comment, almost without understanding; but when Dr Murray had finished, she said slowly, 'You are sure he was asleep all the time I was out—that he never woke?'

'Mrs Christie and Miss Effie say he never stirred—he just slept away.'

'Then I am—in no way—responsible—for his death!'

'You, Miss Forsyth!' The doctor wondered at the painful intensity of the question. 'Why, you've kept him alive!' he said warmly. 'He owes it to your devotion that he lived till now.'

After all, thank God, she had not betrayed her trust. Robina knelt down by the sofa, and looked long at the still features in their perfect composure. Then she rose and went to her own room, and opening the window, stood there motionless, drinking in the cold night-air. The pent-up fever of her day reached its climax in an unnatural calm. Ere long she would have the relief of tears, the strange emotion of those who look before and after. As yet she was wholly benumbed.

So this was life, so long in coming, and it stood before her hand-in-hand with Death. The world was open to her—she was free!

Far off across the dusky fields like a greeting, a swift forewarning of joy unrealised, and for the moment undesired, yet stored in the future as the night holds the dawn in its lap, she beheld the long white smoke-pennon of the southward-bound express.

THE END.

## OURSELVES AND GERMANY.

By E. FEARON.

WHETHER it will be justified or not, there seems to be an impression that the present year of grace, 1918, will witness the end of the war; and although of late we have not heard so much of 'business as usual,' and 'trade after the war,' as we did a year or two ago, there is no doubt that the situation will have to be faced, and the question that naturally arises is, 'How shall we fare in the coming years?' It is not easy to say what attitude the world at large will adopt with regard to trading with Germany; practically all civilised nations have joined together to express their horror and detestation of her barbarous methods of warfare, but will that feeling last long after peace is declared and she is once more hard at work turning out chemicals and toys, electric requisites,

steel goods, &c., instead of shells and submarines? What, too, of her finances and her shipping? These are factors which we can only guess at, but it is extremely unlikely that she has overlooked the immediate future; hence it is well to glance at the state of affairs just prior to the outbreak of war, and gain some idea of what competition we may expect to meet.

An interesting article appeared in *Engineering* in October 1914, respecting agricultural implements supplied by ourselves and Germany, which shows what a large share of this important industry belonged to the latter country. Take a few of the instances given—for example, the import of road traction-engines and steam-rollers into Egypt, which is under British control, in 1912 and 1913. In the former year the two

countries in question supplied the whole of these in equal quantities; *a year later* Germany supplied 94 per cent. of the total! And, in the same class of machinery, Great Britain's share of the imports to Canada is less than  $\frac{1}{10}$ th.

The writer proceeds to point out that Germany and Austria sent no less than a million pounds' worth of agricultural implements, traction-engines, and road-rollers to Russia, against £21,000 worth from Great Britain; to Roumania, £350,000, against our £1300 worth; and, more or less, this held good for Italy, France, and Spain. It is evident, therefore, that there is here a big field for our manufacturers, for there can be no doubt that such machinery will be in greater demand than ever as soon as peace conditions are resumed, and, with our freshly gained knowledge of what can be accomplished in the engineering trade, we ought to be able easily to supply that demand.

In 1913 we imported from Germany nearly £2,000,000 worth of dyes, including some £80,000 worth of synthetic indigo; also some £350,000 worth of drugs and medicinal preparations. Now all these could be, and ought to be, manufactured in this country, and it is a standing disgrace that the import of such articles should have been necessary in the past. Let us ask ourselves why we have become so dependent on outside sources for so many indispensable things, and see if it is not possible to find some reason for our backwardness.

First of all, there is the question of remuneration; research-work, chemical control, and so on cannot be obtained for the pittance that the average British manufacturer bestows on his chemists—if there happen to be any on the works.

Lord Moulton, speaking as chairman at a meeting of the Society of Arts a year or two ago, said that he had had to investigate the question of the supply of certain chemicals formerly obtained from Germany, and the facts were 'a cause for sadness and national humiliation. The chemical industry, except those branches which required least knowledge, thought, and study, had, for the reason, perhaps, that our manufacturers were too well off, or were of sluggish intellect, been allowed to fall into other hands.'

Points made by other speakers at the same meeting are worth deep consideration. For example, referring to the help given to German manufacturers by the banks, Dr Ormandy, D.Sc., said that the heads of German banks were men of high technical knowledge, and not stock-brokers or retired colonels. These men were accessible to the inventor, and ready to avail themselves of technical experts of the highest class to investigate new processes.

Sir William Tilden, D.Sc., F.R.S., said that in order to render the Empire independent of supplies from foreign sources, the industry required many first-rate chemists, a few

engineers, plenty of capital, and some good men of business. British universities could supply the chemists if manufacturers would treat them more reasonably and liberally.

Sir William Ramsay remarked that the Germans organised a chemical trade campaign as they organised a war. Expert committees looked out for new markets and raw materials, created a demand for them, had agencies all over the world, advised as to loopholes in patents, and framed the patent laws so as to exclude the foreigner—all this with State-aid bounties, export-duties, &c.

These are the views of men who are in touch with the chemical and allied trades every day of their lives, and ought to be carefully studied in view of the trade-war that will surely follow the declaration of peace. It is, perhaps, too much to expect that all the necessary and desirable reforms will be effected; but there is one that ought to be carried out at once, and that is the reform of the patent law, which seems specially framed to discourage invention and initiative, qualities which ought to be most carefully fostered and encouraged by Parliament.

Let us turn to other commodities—locomotives, motor-cars, motor-cycles and their component parts, electrical apparatus, fencing-wire, scientific instruments, photographic materials, and many other articles, and it will be found that Germany was exporting them in increasing numbers, not only to such countries as Russia, France, Italy, and Turkey, which are next-door neighbours, as it were, but to South Africa, Japan, America, the Argentine, and Great Britain.

Reading carefully through the speeches and papers on this much-discussed subject, we find a general consensus of opinion that this state of affairs is largely our own fault, among other reasons being our lack of knowledge of local requirements, failure to realise that our competitors will make articles to practically any design a customer asks for, and, generally speaking, old-fashioned methods all round.

Let us face the facts, and own up that if Germany had not, for reasons best known to herself, thought that she had a great chance of once and for all crushing France, and so obtaining the sea-board she so badly needed, and becoming the first Power in Europe, she would have had in a comparatively short time nearly the whole trade of Europe and of Great Britain in her hands.

Slowly but surely she was strangling our commerce; like the octopus, her tentacles were reaching out to our colonies and dependencies, and had not this mad war-lust come upon her, this desire to use the gigantic war-machine she had been creating, who can say what would have become of our trade and of ourselves? But, although everything seemed in her favour in August 1914, somehow she failed to make the most of her long-planned blow for domination,

and ever since she has gone on making mistakes by her attitude of defiance to all the laws of humanity and even ordinary common-sense, till at last even China, whom, no doubt, she would consider as a country beneath contempt, has broken off relations with her.

As a nation, we have risen to the occasion in a way that has astonished the world; we have sacrificed thousands upon thousands of our young men, many of the finest intellects of the rising generation have given their lives for their Motherland, and from every quarter of the globe her sons have rallied to help her in the greatest peril she has ever known.

Shall that sacrifice be in vain; shall we sink again into slumber, continue our bickerings and quarrels, a house divided against itself, a nation without cohesion, and with no settled plans; or, shall we 'quit us like men,' and become, what we so easily can, a nation to be proud of, a nation whom the rest of the world can regard as an ideal and an example?

The opportunity has arisen, and it remains for us to grasp it; if we fail to do so, Germany will once more mature her plans, and profiting by the experience she has gained in this fearful struggle, will scarcely be likely to make such mistakes as she did in those first momentous months of conflict. Let it not be said that we had our warning and did not heed it; the price of our doing so in the past has been a heavy one, but it will be a mere bagatelle to the price we shall have to pay in the future if we take no notice of the awful warning we have received this time.

Trade is by no means the be-all and end-all of a nation's activities, but it is a pretty good index of them, and with modern facilities for transport, commerce, and travel, the nation with the largest volume of trade has a predominance over others that may work for good or ill according

to circumstances. With all our faults, we cannot be accused of misusing to any great extent the powers we possess; generally speaking, our colonies and dependencies have gained by coming under our rule, and it would be a tragedy, surpassing any that has ever taken place, if they were lost to us and came under the brutal heel of Prussianism.

The peril will not by any means be ended with the downfall of the Kaiser and his satellites unless we cast aside the policy that has hitherto been our stumbling-block, and pull together as we ought; it can then be turned into a glorious triumph, and out of this hideous evil good will eventually come, and our sacrifices will not have been made in vain.

So far as trade is concerned, we cannot afford to think that Germany will be unable to compete with us after the war, and it must not be forgotten that the memories of even such a war as this are notoriously short-lived, especially among countries not actually engaged in it. Hence, if Germany can, on the whole, turn out a better article, and one more suited to local needs, packed in a better manner, and at a less cost than a British-made article, then she is going to secure the trade in that article; and, *ceteris paribus*, she is entitled to it.

It is not within the scope of this article to go into further details, but it is correct to say that from all parts of the world trade was going to Germany instead of coming to ourselves because she attended to it in a more business-like manner, and laid herself out to please her customers, whereas we seemed to imagine that our customers ought to take anything we sent them, and be glad to get it!

Such an attitude can only spell ruin, and it behoves us to make a change in it at the earliest possible moment if we wish our country to remain in the forefront of the nations.

## THE MONTH: SCIENCE AND ARTS.

### HIGH-SPEED RAILWAYS.

IN a lecture to the Society of Engineers Mr E. W. Chalmers Kearney stated that the high-speed railway originated by him has now been worked out for speeds up to one hundred and fifty miles an hour, and will come into use as soon after the war as is practicable. A street-level platform has recently been designed, on to which the intending passenger will step from the pavement, and thence into the train. The contour of the line bears some resemblance to an enormous switchback, as a sharp incline downwards is arranged from each station in either direction. The intention is to accelerate departing trains up to full speed by the action of gravity, while upon approaching a station trains

will be brought to a standstill by the same force, without the use of brakes. According to Mr Kearney, tube railways built on this system could have speeds three or four times greater than those of to-day, with the additional advantage that the stations would be actually on the surface, or just beneath it.

### AMPHIBIOUS CRAFT.

A good many attempts have been made to produce a motor-car capable of floating and propelling itself through the water. In such cases, of course, the main purpose of the vehicle is for travelling on land. As a complement to the amphibious car, a boat that will run up the beach has recently been tried at Atlantic City. This craft is fitted with a wheel in the centre,

four and a half feet in diameter, and having a tread twenty inches wide. A rectangular watertight well, built in the middle of the boat, houses the wheel, which projects six inches through the bottom. At the stern is a frame, carrying two wheels and a rudder in such a way that when the wheels are down the rudder is up, and *vice versa*. On land most of the weight is borne by the middle wheel, which is driven by the engine used to propel the boat in the water. When the boat is afloat, the back wheels are raised and the rudder is lowered into its working position. When the shore is reached, the engine is geared to the middle wheel, which it drives slowly, the back wheels are let down, and the craft proceeds up the beach. According to the *Scientific American*, the inventor, Rear-Admiral John A. Howell, retired, considers such boats to be of value for taking excursionists through surf, for life-saving, for coast defence, and for other purposes.

#### CREWLESS MOTOR-BOATS.

Some time back, as reported in the newspapers, the Germans employed off the Belgian coast motor-boats which carried no crew, but were controlled from the shore by electric cables. These craft were fitted with twin-screws, driven by petrol-engines, and the connection with the shore control stations was made through an electric cable, of which from forty to fifty miles were carried on a drum at the stern of each boat, this cable being paid out as the boat proceeded. In the bow was a heavy charge of T.N.T. or some other high explosive, which was arranged to go off when the motor-boat hit the vessel to be attacked. The direction of these craft was carried out by a seaplane, which signalled to the shore which way the boat should be steered. Such craft really constitute surface torpedoes, and they have the advantage of being able to attack in shallow water. Fortunately no successes by this new weapon of the Hun have so far been recorded.

#### FLYING THE ATLANTIC—BY AEROPLANE?

The record flight of two thousand miles by a Handley-Page twin-screw biplane, for the purpose of bombing the *Goeben* at Constantinople, has an important bearing upon the possibilities of the aeroplane for commercial uses after the war. In this instance the machine carried a crew of five, with their luggage and bedding, and a very complete set of spare parts, these including three radiators and two propellers. The net weight of the machine was eight thousand pounds, while the load carried amounted to about six thousand pounds. Due allowance being made for the crew and petrol, this aeroplane should be capable of transporting a cargo of two tons over distances up to, say, five hundred miles. The cost would, of course, be prohibitive for ordinary merchandise, but

mails could be carried at a comparatively small extra charge, which many business firms and private individuals would be willing to pay for the quick delivery. Another machine likely to be used after the war for commercial purposes is the Caproni triple-screw triplane, which is capable of carrying a load of over four tons in addition to the crew. This giant has a spread of one hundred and ten feet, and is fitted with three engines of nine hundred horse-power that give it a speed of ninety miles an hour. A trip across the Atlantic is said to be well within the range of this machine.

#### OR AIRSHIP?

A type of airship suitable for transatlantic service has been suggested by Alexander Livvental, late consulting engineer to Count Zeppelin. This vessel is illustrated and described in the *Scientific American*. Contrary to what one would expect, Mr Livvental does not suggest a complete rigid framework, as embodied in the Zeppelin airship, but proposes a species of umbrella frame, to enable the forepart of the vessel to withstand the air-pressure at high speeds. There is, however, a rigid backbone along the underside of the ship. This construction permits the adoption of the best possible form of hull from the point of view of air-resistance. Moreover, there is only one envelope, which contains the gas, in place of the outer envelope and a number of gas-bags in the Zeppelin. The gas is maintained at considerable pressure, so that the outside surface is perfectly smooth and symmetrical, and offers the least possible resistance in passing through the air. The length of the proposed vessel is one thousand one hundred and fifty feet, the diameter eighty-eight feet. The airship is fitted with motors developing two thousand five hundred horse-power, which power is expected to give a speed of sixty-eight miles an hour. The cargo capacity of this monster is twenty tons, and it would have a range of five thousand miles. An interesting feature is the ability of the engines to consume either petrol or the hydrogen gas of the airship, and these can be fed to the engines in such proportions as the circumstances of the case render necessary or desirable. Expansion and contraction of the gas is provided for by a ballonet along the lower part of the gas-bag, just above the backbone, the pressure in the airship being controlled by pumping air into this ballonet or allowing it to escape therefrom. Mr Livvental considers it of vital importance that America should possess airships capable of crossing the Atlantic for scouting purposes, the convoy of merchant vessels, and the carrying of despatches.

#### ENORMOUS AMERICAN AEROPLANE-FACTORY.

The importance of the aeroplane in modern warfare has been more quickly recognised in the

United States than in this country, and one of the first acts of the American Government after declaring war on Germany was to appropriate one hundred and twenty million pounds for aeroplane construction. Since that time rapid developments have been going on, and what is believed to be the largest aeroplane-factory in the world is already working at its utmost capacity, this establishment having been built in a little over three months. According to the *Scientific American*, this factory measures thirteen hundred feet, or about a quarter of a mile, in length, while it has a width of nine hundred feet. The factory is divided up into nine bays of one hundred feet each. A gallery runs along the full length of each side, and the parts are made on the ground-floor, to be subsequently assembled and put together on the gallery. As in all modern factories, the 'lay-out' is such that the raw material, in the form of spruce, enters at one end, while the finished aeroplanes are despatched at the other. The first operation is the seasoning of the wood, which is done in enormous dry-kilns, having a capacity of one million cubic feet. The various parts are loaded on trucks and run into the kiln as they come from the saws. After seasoning, the parts are finished in thousands of wood-working machines, to be passed on later to a large force of men who build up the wings and bodies. Linen is next applied, and this process is followed by varnishing with a 'dope' of almost pure rubber. Finally the machines are painted, after which operation they are ready for the engines. Fifteen thousand men and women are employed in the factory, and the machinery demands forty thousand horse-power to drive it. No fewer than fifty aeroplanes a day are being turned out at this establishment, and other similar factories will be completed as quickly as possible.

#### THE AEROPLANE AMBULANCE.

One would hardly suppose that an aeroplane offers a very promising means for transporting the wounded from the front-line dressing-stations to the base hospitals. Yet experiments have recently been carried out by the French authorities with a view to employing aeroplanes for this service. A standard machine was used in these experiments, with an open space in the body at the rear of the pilot for carrying a wounded man, who was securely strapped in place, while a wind-shield was arranged to keep off the rush of cold air. Aeroplane ambulances have a speed of eighty miles an hour, and while in the air are free from the shocks experienced in motor-ambulances travelling over rough roads. Some shaking, however, is inevitable on rising and on alighting.

#### MILK FROM ALMONDS.

So long as sweet almonds are procurable no one need lack a milk substitute suitable for tea

and coffee. According to a recipe devised by Mr A. J. Jarman, artificial milk having all the properties of cow's milk can be produced from a mixture of distilled water and finely ground sweet almonds, the only difference between the two being that cow's milk contains animal casein, for which vegetable casein is substituted in the milk made from almonds. The skins are removed from half a pound of almonds by scalding in boiling water, after which they are chopped as finely as possible, and then ground into a paste in a mortar with a little distilled water, more water being added up to about three-quarters of a pound. The mixture is then squeezed through a piece of cheese-cloth or fine muslin into a jug. In a few hours a thick layer of cream will form on this artificial milk, which will turn sour if kept too long. The milk tastes slightly of almonds, but this is not noticeable in tea and coffee. Half a pound of almonds will make three pints of milk.

#### HUGE SCHEME FOR NATIONAL POWER.

Since our waste of coal was touched upon here (March 1917), the Coal Conservation Sub-Committee which was appointed by the Committee of Reconstruction has been investigating the practicability of supplying power all over the country for a much smaller consumption of coal than is the case at present. Power is practically synonymous with electricity; that is to say, in large factories coal is turned into electric current for driving the machinery. Roughly, eighty million tons of coal are used every year for generating power in this country, most of it being consumed in small, inefficient power plants. Even if the existing electric supply industry is considered, the position is by no means satisfactory, this business being in the hands of over six hundred undertakings, the majority of which are controlled by comparatively small local authorities and companies. To obviate these drawbacks and supply power all over the country at the lowest possible cost, the above-mentioned Sub-Committee propose the establishment of eighteen super-power stations in different parts, mostly in close proximity to the coal-pits. Advantages of this system are set forth in the Sub-Committee's report as follows: 'The health of the great industrial centres and the congestion of the railways in their neighbourhood would be radically improved by arranging to carry out the conversion of coal into motive-power away from the densely populated centres. By placing either the main or the supplementary plants at or near the collieries, much coal that is now wasted or left in the pits could be profitably utilised, and the coal that would otherwise be used to transport the coal used would also be saved. By-products—nitrogenous fertilisers, crude oils, oils for marine propulsion, and motor spirit for road traction—obtainable from coal before it is consumed in the boiler-furnace, or producer,

could be extracted in any case where it was proved economical to do so.' It may be mentioned that large quantities of coal are brought to the surface to be dumped in a heap as waste. This material, although unsuitable for small power plants, could be fully utilised in the super-power stations suggested. The Committee estimate that no less than fifty-five million tons of coal per annum could be saved by carrying out the above scheme.

#### UNITED STATES NAVY IDENTIFICATION DISCS.

In making their preparations for entering the war on a large scale the United States is rightly doing its best not only to take full advantage of the experience gained by the Allies, but also to 'go one better.' For instance, special identification discs or tags (which have been described in the *Scientific American*) are being prepared for every officer and man in the American Navy. These discs are made of monel metal, which has a very high melting-point, and is not corroded by sea-water. The tags are oval in form, measuring one and a half inches in length, with a width of one and a quarter inches, and a hole is drilled at one end for suspension from the neck by monel metal wire-braid. The novel feature of these discs is that on one side they bear the print from the right index finger of the wearer. Printer's ink, thinned with petrol or turpentine, is used for writing the name of the officer or man, with other particulars, on one side of the disc, while the finger-print is made on the other with the same kind of ink, thinly spread upon a plate on which the finger is pressed before making the impression. The writing and the impression, while still wet, are sprinkled with powdered pitch, some of which adheres to the ink. The plate is then heated until the powder melts and emphasises the writing and the impression. Once the marking has become hard, the plate is put into a bath containing a solution of nitric and hydrochloric acid, where the metal unprotected by the ink is rapidly eaten away until the plate becomes about half its original thickness, when it is taken out and washed. This type of identification disc should render identification easy and certain, and it will infallibly prevent the successful impersonation of one man by another.

#### MAKING OUR OWN DYESTUFFS.

The important announcement was recently made that two hundred and fifty-seven valuable dye recipes in use at the Badische Works, the leading factory of its kind in Germany, had been captured and secured for use in Great Britain. The two gentlemen who were mainly instrumental in obtaining the recipes, and the group of textile merchants associated with them, had, it was stated, no desire to monopolise them, but were prepared to sell them to the Government, so that the dyes might be accessible to

all British manufacturers. What can be done by private initiative is shown in the last annual report of Messrs Levinstein, of Blackley, Manchester. Even without Government assistance, private firms are becoming independent of the foreigner in regard to dyestuffs. Before the war Germany supplied about 80 per cent. of these; now the energies of her factories have been turned towards the making of high explosives to be used against us. Our textile industries engaged in the production of military fabrics required large quantities of a comparatively small number of dyestuffs. It appears that the investment by Government of two millions sterling in British Dyes Limited at Huddersfield did not fully solve the problem of meeting the demand. Messrs Levinstein claim that they produce more dyes, of a greater range of colours, than all other British makers of aniline dyes put together. Since the war began they have been the largest suppliers of aniline dyestuffs to the War Office, the Admiralty, and Allied armies, and they have shipped large quantities to America for the U.S. armies. When the Belgian Army uniforms were changed to khaki, the necessary dyes were furnished within four days; the whole orders for dyes in connection with the equipment of troops of the Australian Commonwealth were as quickly executed. In the case of a certain blue dye wanted by the Admiralty, the firm had to manufacture six intermediate materials, none of which prior to the war had been made in this country; and they became sole suppliers of fast aniline blues to the Admiralty. At Blackley works over one hundred organic products never before produced in this country are now being made. The German indigo-factory at Ellesmere Port was taken over by Messrs Levinstein, and there synthetic indigo of excellent quality is being produced.

#### WASTE IN CHEESE AND BUTTER MAKING AND MILK-POWDER FACTORIES.

In an address to the Ontario Agricultural Union, Professor Dean of Guelph said that cheese, or life-meat, is receiving more attention at the present time than ever before in the history of the cheese business of Canada. The world is beginning to realise the value of cheese as a concentrated food. An unforeseen difficulty has developed in the manufacture of cheese—namely, the limited supply of rennet. One of the largest manufacturers of rennet says: 'It is impossible at the present time, and in all probability will be difficult for years to come, to produce sufficient rennet extract to go round.' In consequence firms are offering substitutes for rennet in the form of pepsin in powder and solution, and a rennet enzyme. Of the various substitutes tried at Guelph College, a mixture of rennet and pepsin has given the best all-round results. The rennet seems to be necessary to digest the curd,

and the pepsin no doubt aids in the digestion of the cheese. To producers of cheese-milk Professor Dean offered the suggestion that, in addition to the usual points to be observed, such as keeping the milk clean and cold, rain-water should not be allowed in milk, as it makes coagulation of the milk more difficult and lessens the yield of cheese. There is a great waste of human food, he said, in the manufacture of both cheese and butter, where the by-products are not properly utilised. As an example, the province of Ontario is making in round numbers about one hundred and twenty-five million pounds of cheese annually; during the same time there is being run into the whey-tanks of the cheese-factories a very large amount of solid material of the most valuable human food ever prepared by nature. For each Canadian ton (two thousand pounds) of cheese produced there are approximately nine tons of whey, which contain about one thousand two hundred and sixty pounds of milk solids. Between thirty and forty thousand tons of milk solids are practically wasted annually in the whey-tanks of the province. It would require two thousand cars, holding twenty tons each, to carry these wasted food products to market. A partial solution of this problem is furnished by the establishment in some of the best dairy centres of condensed-milk and milk-powder factories. These factories utilise *all* of the milk solids for human food. In consequence they are growing in popularity among dairy-farmers. The products are marketed as plain condensed or evaporated milk, sweetened condensed milk, whole milk-powder, and skim-milk powder. These products are a distinct and welcome addition to the world's human-food supply.

#### NEED FOR INCREASED PIG-REARING.

Pig-breeding in Great Britain has not kept pace with the demand for bacon; the food difficulty and various legislative enactments have acted as discouragements. Yet this is a paying, a necessary, even a patriotic occupation. As has often been pointed out, a good breeding sow may have two litters a year, and the young may be fattened for pork or bacon in six months. To fatten a sheep or a bullock takes a good deal longer. Practical men say that what is wanted is to get the Food Controller to liberate certain quantities of rough maize, barley, and bran for feeding purposes. Meanwhile many breeding sows have been killed off owing to the dearness of pig's food and the difficulty in obtaining it. By-products from the distilleries have also ceased to be available. Dr Woods Hutchinson, in his *Health and Commonsense*, remarks that though pork takes a long time to digest, it is 'one of the surest foods that we have to give off all its energy to the body.' He has seen many cases of dyspepsia cured by breakfast bacon. Pork, including ham and bacon, he says, is easily our second most valuable meat food. The Ontario

Department of Agriculture has issued a handy and instructive circular (No. 6) entitled 'Keep an Extra Sow and her Litter.' Although there are differences in methods and opportunities in Canada, as compared with Great Britain, in regard to pig-feeding, the hints and instructions here given will be of service to those who rear swine anywhere. We are told that since the beginning of the war the herds of swine in Europe, including enemy countries, have declined by two and a half million head. The numbers now available are not sufficient for the demands of the Allies; and the importation of pork products has dwindled. The Allies look to North America for a large share of their pork and pork products. Since the entry of the United States into the war there has been a greater demand for these products, while the still further reduction of European herds is certain during the war. The Food Controller of Canada, in order to encourage the keeping of hogs, has arranged with the millers that mill feed will be sold by them at cost price. Packing-houses are subject to strict regulation, and limited to a fair margin of profit. The pamphlet discusses in a clear and practical fashion the questions of swine-breeding and rearing in Canada, in which Great Britain ought likewise to do a great deal more. There is a Departmental Committee for Pig-Breeding in Ireland, with headquarters in Dublin.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

#### WHEN.

WHEN the rain is over  
We'll go and gather flowers;  
And they will smell the sweeter  
For being wet with showers.

When the battle's done with  
We'll reap the shining grain;  
And peace will be the deeper  
Because it's won through pain.

When the journey's ended  
At home we'll lay our head;  
And home will be the happier  
Because our feet have bled.

When the night has faded  
The Day will conquer doom;  
And dawn will be the gladder  
Because we've braved the gloom.

EDITH L. ELIAS.

#### \* \* TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, **ALL MANUSCRIPTS**, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them IN FULL.*
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

### THE MYSTERIOUS MIASMA.

By ALFRED COLBECK, Author of *The Serpentine Candlesticks*, *The Lady of the Pines*, &c.

#### CHAPTER I.

'CAN I see the manager?'

'Is it work you want?'

'I want to see the manager.'

'He's busy. He doesn't like to be bothered with small matters. Now, if it's work you want'—

'After I've seen the manager, please,' the stranger persisted with decisive politeness.

The foreman glanced at him again. His bearing, calm and erect, not to say masterful, and the hardening clearness of his steady gray eyes, were out of keeping with the workman's clothes hung upon him, fitting where they touched, ready-made, quite new.

'Miss Fairley,' said the foreman to the girl-clerk, 'will you please step up to the manager's room, and tell him that a—workman, a—gentleman desires to see him?'

'Thank you,' returned the stranger; then, when the girl had gone, 'One may be both. Which will she say? You were not explicit.'

'The second, I fancy, straining a point to secure you the interview.'

'Why straining a point?'

'A gentleman generally sends up his card.'

'Yes—that is so. And I have no card with me. I might have sent up a slip of paper with my name written upon it. But it is too late now,' the new-comer remarked resignedly and with a dry smile.

The foreman had not given him the real reason why he thought the girl would strain a point. The real reason was his own reason—the stranger's speech and manner; for the foreman also had strained a point in surrendering to the stranger's wish. His ill-fitting workman's garb had been assumed for a purpose the foreman could not fathom.

'Mr Kennerley will see you, sir,' announced Miss Fairley, with no hesitation on the final word. She was shrewder than the foreman.

The stranger passed up the stairs. He tapped at the door of the manager's room, and, in response to the immediate summons, walked in.

'Excuse my toggery,' he apologised.

The manager started, gazed at him, and said, 'Dr Neville?'

'The same. But you will want more than

No. 379.—VOL. VIII.

my word for it; and he produced a letter of introduction from the Minister who had sent him down.

'Sir William 'phoned me this morning,' said the manager. 'I was expecting you.' He read the letter, folded it, and passed it back. 'But why'—and he paused, his eyes roving inquisitively over the new-comer.

A heather-mixture cloth cap was swinging in his hand. A silvery spotted blue neckerchief was knotted at his throat. His loose jacket matched the cap. Immaculate moleskins covered his nether extremities. He was like a stage workman. Everything about him was obtrusively new.

'The disguise?' queried Dr Neville. 'I'm seeking work. The foreman, who happened to be below, was inclined to bar the way to you. I think he would have given me a job. But if you set me on I shall have freer facilities. Yes'—he went on, in answer to the manager's roving eyes—'the toggery is new. I had to buy it on the way down. It was a compromise. I am rather squeamish about my attire, and could not quite make up my mind to buy soiled and greasy second-hand stuff. I prefer to accumulate my own—extras.'

The manager smiled and motioned him to a chair. Then, drawing his own chair nearer, he said, 'Your unspottedness is—what shall I say?—attractive.'

'Unfortunately,' he confessed. 'But in a day or two I can take the shine off. Give me a dusty bit of work, with a sprinkling of oil about it, and I'll turn this painfully new attire into the conventionally approved hue. You see, Mr Kennerley, I must be in the thick of it, as a workman, unknown, disguised, to find out the cause of the trouble.'

'And afterwards?'

'Events will guide me.'

'Then, for the present, you will be Dr Neville only to me?'

'Only to you, Mr Kennerley; and to you even, while I am a workman, let me be Richard Edge, or, if you prefer it, Dick. As a precaution, write the name down, and I'll answer to Edge or Dick impartially. Have you anything new to report?'

[All Rights Reserved.]

MARCH 2, 1918.

'We have had two visitations of the miasma—if it is miasma—since Sir William was here.'

'If it is miasma,' repeated Dr Neville reflectively. 'There should be no miasma in this locality. Did it spread much?'

'Along the ground, as before, but not over the same areas.'

'It invaded the office beneath?'

'The last one. Miss Fairley was driven up into my room. We could breathe freely here.'

'How long did it remain?'

'Not long. It lingered in the low confined spaces, but remained only a few minutes in the open where the wind was blowing. We opened the office windows, and the wind dispersed it—carried it clean away.'

'Did you smell anything?'

'No.'

'Was there any perceptible colouring?'

'A faint glow simply—no colouring—a radiation like that thrown off by white-hot metal.'

'But no heat?'

'None whatever.'

'And the effects?'

'To those caught in it? Nausea, choking, suffocation. Our fatalities number twenty-seven. Fifty-three survivors are under medical treatment, the more serious cases in a neighbouring hospital, the remainder in their own homes.'

'Fifty-three and twenty-seven are eighty. That's a considerable depletion of labour.'

'We cannot get labour. The people are scared. Many have left. Few apply. If the peril cannot be met, we shall have to go; and that would be a pity, for the locality is ideal for the manufacture of high explosives.'

'It is—ideal,' agreed Dr Neville. 'The peril must be met. A removal of the plant to some other locality would stop the output for a time, and perhaps permanently lessen it. We cannot submit to that. These high explosives are urgently needed. We must have them. Besides, to abandon the works because of this—miasma—would be a confession that here, at any rate, our enemies had got the better of us. No one shall wring that confession out of us. The peril must be met; and not only met—it must be exposed and overcome. And so, Mr Kennerley, I will take my place among the workmen, and investigate—find out what I can.'

'Then?'

'You shall promote me—find me a place in the laboratory.'

'And drop your *alias*?'

'Maybe. But, until then, treat me as a mechanic.'

'Day, the foreman, may be suspicious.'

'I cannot help that. Let Day form his own opinion of me. I shall want lodgings, the ordinary lodgings of a mechanic—a sleeping-room, sweet and clean, and not too far away. I had better board with the family. Do you know of any one who would take me in, and do for me?'

That, I think, is the correct way to put it; and Dr Neville smiled.

The manager was thinking, and said presently, 'Miss Fairley's people might accommodate you.'

'Are they natives?'

'Yes. Mr Fairley is a retired tradesman, with a small freehold of his own, and a pleasant house and garden. You would be very comfortable there. It is half a mile away.'

'Will you speak to Miss Fairley?'

'Certainly.'

They went down together. The manager introduced him by the name of Richard Edge, a mechanic, whose respectability he could vouch for, and asked the girl if her people could find him a room, and board him.

She turned her swift and searching brown eyes on the stranger, hesitated for a moment, and then said, dubiously, 'I don't know. We have never had a lodger. If Mr Edge will see my mother'—

'I will wait, and walk home with you,' suggested Edge, 'if you will permit me. It is just on closing-time.'

The girl blushed slightly, and replied, 'As you like,' and abruptly resumed her work.

'As *you* like, Miss Fairley,' he responded, with a courteous inclination, which, although she had turned away from him, did not escape her notice.

'Very well, then,' said she, much more graciously. 'I shall be ready when I've finished this;' and her fingers ran nimbly over the keys of the typewriter.

#### CHAPTER II.

THE mother was like the daughter. She looked at him inquisitively, inwardly surprised at the staring newness of his clothes, and hinted that they were in no need of a lodger.

'As a paying guest, then, Mrs Fairley,' countered Edge, who had already observed the cleanliness of the interior, and the taste displayed in the arrangement of the furniture, in the toning colours of the papering, the carpet, and the upholstery, and in the few and carefully selected etchings and photogravures that adorned the walls. Freshly picked roses, massed in an old china bowl, and overflowing its rim, filled the room with their fragrance; and through the open window, its long white curtains waving in the breeze, floated the mingled scents of a well-kept garden—scents all the more pronounced because of the softness of the evening air. 'You might receive me as a paying guest,' he pleaded, with a pleasant smile, but not too eagerly. 'A room to sleep in, and an additional chair at your table, Mrs Fairley, would suit me exactly. I am sure we could come to terms.'

'It is not a question of terms.'

'I know it, and mention it only as a guest willing to pay.'

'Are you a mechanic, Mr Edge?'

'For the time, Mrs Fairley, I am a mechanic—for the time,' he repeated, his gray eyes fixed upon her steadily and inspiring confidence. 'You will respect the admission.'

'There are only three of us at home just now,' she remarked, somewhat irrelevantly. 'My two sons are away, one in France, one up the Tigris'—and her voice trembled a little—'so there would be'—

'A place for me,' he interposed hastily; then, sympathetically, 'I hope your boys are doing well.'

'Y-e-s,' reflectively, and, as an afterthought, 'Thank you. I cannot say definitely, Mr Edge. If I consent it must be subject to John's concurrence—my husband,' she explained. 'He will not be back until eight o'clock.'

'I shall be quite satisfied,' returned he, 'to leave it to your husband's decision. I will have my portmanteau sent up, in the hope that he will be agreeable; or, perhaps, I had better fetch it. I left it at the station.'

It was a quarter past eight when Fairley entered the garden. His wife had told him of the stranger's request. Edge was reclining in a deck-chair. The gray-blue wreaths from a well-seasoned cigar were floating above him. He was lost in contemplation. He was transformed, too, into a different-looking man; for he had changed his attire. In place of the workman's garb he wore a smart and easily fitting lounge-suit of dark gray, and his lean, clean-shaven face was shaded by a slouch felt-hat of the same colour.

Fairley, a stout man of sixty, bearded, with a ruddy complexion and a frank and open face, was close upon him before he was aware of it. He dropped his cigar, and sprang briskly out of the chair.

'Mr Fairley, I presume?'

'Yes. You are Mr Edge?'

'I answer to that name. Pardon my intrusion, Mr Fairley, and assure me of a welcome. I should be sorry to be turned out.'

'Well, we are hospitable, I hope; but'—and Fairley paused, and gazed at Edge very steadily for a full minute. The gaze was met just as steadily. Edge was not in the least disconcerted. Then, simultaneously, as if moved by the same impulse, both faces broke into a trusting smile. Fairley's objection had gone. He said, 'I cannot turn you out.'

'That's negative,' returned Edge, 'and satisfactory so far as it goes. Do you smoke?' and he opened his cigar-case.

'A pipe—thank you,' replied Fairley, pulling forward another chair, and proceeding to fill his briar.

'I, too, will try a pipe,' said Edge, producing his own briar. They sat down side by side, and Fairley passed him the pouch. 'That's positive,' Edge went on, 'and quite satisfactory,' as he

accepted the tobacco. 'We'll call it calumet, the ratifier of treaties, the pipe of peace.'

Mrs Fairley and her daughter were looking on, unseen, from an upper window, a pardonable inquisitiveness, considering what was at stake. When the pouch was passed Mrs Fairley said to her daughter, 'He's staying, Leila. We can make up the bed.'

And so Richard Edge was 'taken in and done for' by the Fairleys. They found him to be a very pleasant guest—unexact, entertaining, companionable. But they knew from the first that he was not a mechanic. Leila declared privately that he was a clever scientist sent down by the authorities to investigate, and, if possible, to counteract, the dreaded visitations of the mysterious miasma—a happy guess, and near the mark. But Leila had no idea that he was a professor of physics, a member of the faculty of a university renowned for its research, and that he was more familiar with gases, and gravitation, and modes of molecular motion, and all such-like phenomena than he was with the construction and repairing of machinery. In a month or so the manager promoted him; he entered the laboratory—took charge of it, in fact; and Leila, talking with her mother, nodded her shapely head wisely, but refrained from saying, 'Didn't I tell you?'

Two or three days had sufficed to reduce the newness of Edge's garments to the regulation colour. His appointment as a mechanic by the manager himself, accompanied by a hint to Day, the foreman, secured for him privileges which Day might otherwise have interfered with, and perhaps resented. Day found no fault with him. He did his work well. And, while at work, he scrupulously carried out the foreman's instructions. But at other times he was free to stroll into and over any part of the widely extended premises. He mingled with the workpeople, men and women—the majority were women—chatted with them, listened to them, cultivated their acquaintance, ascertained what their views were of the spasmodic visitations called by some 'the haze,' by others 'the miasma.' And he collated carefully all the information he gleaned in this way.

The works were situated entirely among a stretch of rolling sand-dunes. The low sheds were in the hollows, separated and mostly hidden from each other, the farthest shed quite two miles away from the main entrance. The dunes ran north and south, accommodating their western border to the slight curve of a lovely bay. Eastward, having covered half a mile, the dunes encroached upon the herb-scented meadows, nipped crisp and short by sleek milch cows. Seaward, the sand was broken by two widely separated outcrops of low, black cliffs, broken in outline only, for, above and behind the cliffs, the sand was paramount. Close in, the sea was shallow, and seldom visited even by the smallest

fishing-craft. It was a lonely place. To the south of it, on the banks of an inlet, there was a small town; across the inlet a village; and, five miles away, on the other side of the bay, a town of no great size, devoted mainly to fishing.

In such a situation miasma was almost impossible. True, the inlet widened landwards, and the hot sun, when the tides were low, drew from the level marshes exhalations that occasionally drifted across the dunes. But these were utterly different from the transparent and odourless miasma creeping insidiously through the hollows, and, ere the people were aware of it, constricting the muscles of the throat, and throwing them into violent convulsions. And the miasma was confined to the works. At the end of Edge's first week, on two successive days, there were slight visitations, both comparatively harmless, and in the middle of the third week another much more dangerous, claiming seventeen victims, five of whom died.

Again, in the beginning of the sixth week, while Edge was engaged in the laboratory, he heard an outcry, and, rushing to the window, saw the faintly luminous waves spreading, and the workpeople clambering up the yielding sand to the tops of the dunes—the only refuge from

the distressing, and maybe deadly, attacks of the mysterious foe. The radiation isolated the laboratory. It also isolated the office across the way. The manager would be immune in the upper room. But Miss Fairley was in the lower room. What if she were caught by it? Hastily dipping a pad in a solution close by him, Edge fixed it over his mouth and nostrils, and dashed across. There, to his dismay, he found Miss Fairley prone, gasping, in the grip of the miasma, and well-nigh overcome.

He ran to her, raised her, carried her up the stairs. Tearing away the pad, he gave himself resolutely to her restoration. The manager assisted him. Soon a convulsive shudder shook her. She opened her eyes and began to breathe more easily. The inevitable nausea followed. For several days she felt the effects of it, and was unable to return to her duties. Her mother, alarmed—for this was the first time Leila had been caught by it—tried to persuade her to give up the office-work. But Leila replied, 'No, mother. Why should I? Our country is as dear to us as it is to the men. Jack and Will are helping to defend it in France and Mesopotamia. I must help at home.'

## A NECDOTAGE.

By C. L. G.

THERE are few books more unsuitable for continuous reading than collections of jokes. For my own part, I think one of the most depressing hours I ever passed was spent in reading an early edition of *Joe Miller*. It was not the staleness of the jokes so much as their quality that lowered one's spirits. Strings of anecdotes and good sayings without any introduction or comment only make for weariness, as a plum-pudding entirely composed of plums makes for indigestion. A plum-pudding with only one plum in it would be more endurable. The solitary joke in Liddell and Scott's Greek Dictionary—the remark that the conventional derivation of the word *συκοφαντης* is 'probably a figment'—is immensely refreshing from its unexpectedness, and, as a great physician once said, the essential element in recreation is surprise. Of course, there are books primarily anecdotic in their aim which are altogether delightful and even instructive. But such a result needs skill in presentation. Dean Ramsay is a classic example of the illuminating method. He gave the *coup de grâce* to the view that the Scot jokes with difficulty, just as those two wonderful ladies, Miss Violet Martin and Miss Somerville, triumphantly dispelled the notion that a woman's sense of humour was at best a pale reflex of the masculine variety. Their partnership—broken by the untimely death of Miss

Martin—was no ordinary collaboration, in which the share of each writer is easily recognised. It was a union of kindred minds working in such close intimacy that there was not a page, a paragraph, or even a sentence in any of their works which either of them could claim entirely as her own. Most of their readers regard them as humorists pure and simple. They were that and a great deal more. The book by which they themselves set the greatest store was *The Real Charlotte*, a study of Irish society, gentle, genteel, and simple, approached and carried out in the manner of Balzac. When they borrowed, it was not from books, but from the living, unprinted speech of their countrymen, and for one good saying that they appropriated, they coined a dozen of their own. Their humour was always relevant, and never dragged in by the hair of the head. This is a digression, but I never miss a chance of paying homage to my favourite modern novelists, who have not yet fully come by their own, and are at the moment partly eclipsed by the competition of in-artistic imitators.

It has occurred to me, in reading some modern autobiographies, that their writers, before indulging the desire to 'brighten' their pages with anecdote, would have done well to take for their watchword, 'Lest we remember.' The mischief is that so many people have remembered before

us, and recorded their remembrances with greater point. '*Pereunt qui nostra dixerunt ante nos*' is an old saying, and it does not merely express the resentment of the second of two great wits who have jumped together. It applies to the anecdote-monger who records good stories and sayings in the belief that they have only enjoyed an oral currency, when, as a matter of fact, they have often appeared in print before. It is a curious example of the way in which words change their meanings that the Greek word *anekdotos* signifies 'unpublished,' *inédit*, whereas 'anecdote' in the modern sense is applied to sayings or stories which have been published again and again. When they are spoiled in the retelling—which happens more often than not—all that can be urged in mitigation of the offence is that the stories or sayings are probably new to the majority of readers. But sometimes anecdotes are improved in the process of transmission, if the decoration is added by a humorist or an artist. For instance, there is the often-quoted story of Herbert Spencer's rebuke of the young officer at the close of a game of billiards in which, after the philosopher had opened with a miss, his opponent ran out without giving him another chance of scoring. The story as usually told restricts Herbert Spencer's comment to the reference to 'a misspent youth.' But quite recently I heard it given in this extended form: 'Moderate proficiency I can respect and even admire; but skill such as yours, sir, is the sure sign of a misspent youth.' Whether authentic or not, the preliminary sentence heightens the flavour of this portentous utterance. It must be admitted, however, that Herbert Spencer never spoke as harshly of others as others have spoken of him. Carlyle is reported to have called him 'the most unending ass in all Christendom,' and Mr Balfour Browne, in his recently published *Reminiscences*, describes his philosophy as 'a stickit engineer's mechanical theory of the universe.'

But it is not only unconscious humour that gains from embellishment. Take, for example, Gilbert's delightful 'Limerick' in blank verse, which I had always known till recently in the following form:

There was an old man of St Bee's,  
Who was stung in the leg by a wasp.  
When they asked, 'Does it hurt?'  
He replied, 'No, it doesn't;  
I thought all the while 'twas a hornet.'

A year or two ago an amateur of 'Limericks' described in a weekly paper how Gilbert, in reply to a letter about his unpublished nonsense rhymes, sent several 'Limericks,' including the following:

There was an old man of Tralee,  
Who was stung in the arm by a wasp.  
When they asked, 'Does it hurt?'  
He replied, 'No, it doesn't;  
It may do it again if it likes.'

Now, apart from the word 'Tralee,' which suggests the rhyme 'bee,' there can be no doubt as to the superiority of the unauthorised version. The introduction of the 'hornet' is a stroke of genius.

Apropos of 'Limericks,' how few people who retail or compose them are aware of the origin of the name! Even the *New Oxford Dictionary*, which explains it up to a certain point, fails to account for the choice of that particular city in the refrain of the stanza which has long since dropped out. Most people imagine that Lear was the inventor of the form. As a matter of fact, it was in use at least a generation before him. Lear retained the old form, in which the second half of the last line is identical with the second half of the first. But so far as the contents are concerned, he made the 'Limerick' the handmaid of pure nonsense in all senses of the adjective. From beginning to end you will not find a single topical allusion in Lear's verses. There is one unconscious prophecy in which a practice of Mr Gladstone is foreshadowed in the couplet:

There was an old man at a station  
Who made a promiscuous oration.

But Lear had few followers. The 'Limerick' undoubtedly gained by the introduction of a new rhyme in the last line; but, for the rest, it was cultivated in the interests of topical satire or burlesque or unseemliness. Many of the wittiest 'Limericks' are unprintable. Perhaps the cleverest of all, while void of offence, were limited in their appeal by their academic or technical character. A year or so back a collection of 'Limericks,' ancient and modern, was made by an editor more remarkable for his industry than for his discrimination. It is for the most part a deluge of drivel, redeemed by a homœopathic admixture of wit. The prize-competition nuisance, however, was responsible for one extraordinary incident. A very famous Victorian man of letters was a constant competitor under an assumed name in these tournaments, but never succeeded in gaining a prize. He consoled himself, however, by the reflection that, in view of the quality of the prize contributions, his consistent failure proved that his brain had not given way. But he was not the only man of genius who condescended to this popular and ribald stanza. When one reflects that Thackeray and Dante Gabriel Rossetti both cultivated it, there is some excuse for saying, 'Scorn not the "Limerick."' If 'the thing' never 'became a trumpet,' at least it can be made a singularly effective penny whistle.

To revert to Gilbert, the example given above of his verses being improved in transmission is not typical. His work did not lend itself readily to embellishment. Within his limits he was a consummate craftsman. And it is a curious fact that some of his very best work is

almost unknown. He never wrote anything wittier or more ingenious than his delightful burlesque on *Hamlet—Rosencrantz and Guildenstern*—which has been less often seen on the boards than any of his other pieces. Certainly it is very short; but probably a greater drawback is its cleverness, which needs an esoteric audience. The ordinary theatre-goer would probably be unable to appreciate what is perhaps the best thing in the burlesque—Ophelia's review of all the different theories of Hamlet's eccentricity, in which the special features of various famous impersonations are described, and which winds up with the verdict that:

Hamlet is idiotically sane,  
With lucid intervals of lunacy.

It was *Hamlet*, again, which inspired Gilbert with his famous criticism of the reading given by a well-known actor as being 'funny without being vulgar.' Even more sardonic was his comment on the Falstaff of the same actor. The story goes that Gilbert went to see him in his dressing-room between the acts on a very hot night. The actor, heavily padded for the part, was perspiring freely, and Gilbert, after looking at him in silence for a few moments, observed, 'Your *skin* acts very well.' Criticisms of this acid quality do not conduce to the popularity of the critic, and in these days are seldom committed to print. But I remember reading a notice of a concert not so many years ago in which the critic, alluding to a singer more remarkable for the volume of her voice than for her intelligence, compared her to a bank-holiday trombone-player on Blackpool sands. People nowadays are more thin-skinned, more resentful of hostile comment, than they were in old times. We read that Dryden, the greatest of our satirists, was by no means unpopular in literary circles, in spite of his lacerating pen. Possibly his sincerity was discounted in view of an opportunism which enabled him to bestow equal eulogy on Cromwell and Charles II.

I wonder how much he was paid by the be-reaved nobleman who commissioned him to compose that long and minute panegyric of the deceased countess, whom Dryden frankly confesses in the preface that he had never known. As for his vitriolic portraits of political opponents, the odd thing about them is that they often apply with far greater force to statesmen and public characters of later generations than to the original victims. Dryden was neither just nor judicial in his censure, but he showed a profound insight into human nature. Johnson's often-quoted remark about patriotism being the last refuge of the scoundrel was forestalled in that wonderful couplet in which Dryden notes how easy it is

In factionous times  
With public zeal to cancel private crimes.

One has not to look far to-day to find modern

instances to prove the truth of this maxim. Dryden is not read or admired by our young poets. Curiously enough, it has been reserved for a cleric, the Rev. R. A. Knox, to take for his model, in his brilliant onslaught on the Higher Criticism, Dryden's greatest political satire, and incidentally to show that the heroic couplet, when handled by a master, is still unsurpassed as a medium of controversy. Mr Knox's satire was published not long ago in a volume of Oxford occasional verses, mostly of a sentimental or exotic type, which were simply overwhelmed by juxtaposition with this amazing and formidable *tour de force*. It was like meeting a rogue elephant amid a herd of gazelles.

Just as it is easier in fiction to make the adventurer or adventuress more interesting than the blameless hero or heroine, so for one genuine and finely expressed compliment you may find ten memorable censures or depreciations. Dr Johnson's tribute to the invulnerable excellence of Sir Joshua Reynolds is all the more remarkable because he was not lavish of praise. The interchange of generous admiration between Tennyson and Browning is a pleasant proof of the ability of rivals to comprehend one another; but great men have not always been so broad-minded. Scott, if he erred at all, erred on the side of over-appreciation; but Scott's magnanimity was as great as his genius. One of Meredith's greatest contemporaries said that reading his novels was like 'wading through glue.' A well-known critic, on hearing of this verdict, observed that it would be more true to say that it was like 'diving for pearls in glue.' References to women in the classics are more often bitter than not. Chivalry, as we understand the term, is rarely encountered in Greek or Latin writers. 'Do not believe a woman even when she speaks the truth' is typical of their attitude. And yet there are exceptions. Perhaps the most beautiful epitaph in existence is the laconic utterance of a bereaved husband: '*Nil unquam peccavit nisi quod mortua est;*' and Steele's famous saying, 'To love her was a liberal education,' is only a translation of the Greek maxim, *μουσική ἔρως διδάσκει*.

The scrapping of the classics will enable writers in future to claim originality for a great many plagiarisms or unconscious borrowings. Unconsciousness, it may be added, ministers largely to our amusement in that figure of speech which is technically known as *metaphasia*, and consists in the transposition of words, syllables, or initials. The present writer can remember a story, current at least fifty years ago, of a clergyman who recited a well-known text in the form, 'Grief may endure for a joy, but night cometh in the morning,' and of another who spoke of the plague of 'grasspillars and caterhoppers innumerable.' Best of all was his perversion of a well-known text into, 'It is easier for a rich man to

pass through the knee of an idol than for a camel to enter into the kingdom of Heaven.' Lewis Carroll, a little later, in the preface to one of his books, described the formation of portmanteau words. For example, a person in doubt between 'Richard' and 'William' would say 'Rilchiam.' But by far the most popular and mirth-provoking result of these vagaries of the speech-centres is due to the involuntary transposition of initial letters, which for the last forty years has been associated with the name of its most illustrious exponent. The majority of examples are probably invented, but some of the best are genuine. For example, 'I live on a very quiet staircase. There are only two other men on it—Hell and Bedlam.' It is assuredly one of life's little ironies that a man of serious aims and dignified position, like the Rev. Mr Spooner, should be immortalised by entirely unintentional contributions to the gaiety of nations. But, after all, his fate is happier than that of the famous Hungarian patriot whose name is associated, in the minds of ninety-nine out of a hundred persons outside his country, solely with an aperient water.

Aristotle discourses on the courage of ignorance. There is also the humour of ignorance, which is a sub-species of unconscious humour. Musicians will remember that there was once a learned composer who, in order to distinguish him from his papal namesake, was known as 'Clemens non Papa.' One of his compositions figured in the programme of a concert sometime in the latter half of the last century; but whoever was responsible for the titles and names was dissatisfied with his familiar signature, and altered it to 'Clemens Junior'! Unconscious humour of the same order was once shown by an exalted personage who was the patron of a musical society, and attended their annual smoking-concert. On one occasion, when the programme was, in accordance with usage, submitted for his approval, he found it rather long, and, seeing that several partsongs were included, suggested that it might be shortened by 'leaving out some of the parts.' But my favourite musical anecdote in this context is one the humour of which resides in scene and circumstance rather than in speech. At a state function the Exalted Personage was specially attracted by a vivacious number played by the orchestra, and inquired its name from one of the officials in attendance. The official consulted the conductor, and returned to say that it was a popular melody of the day. Dissatisfied with the inadequacy of the information, the E. P. insisted on knowing what the words were, and the official was obliged to recite the lines:

Come where the booze is cheaper,  
Come where the pots hold more;  
Come where the boss is a bit of a joss,  
Come to the pub next door.

Anecdotes, as we have seen, sometimes gain from embellishment and adaptation. For example, there was a story current in former years

illustrating the excessive luxury which prevailed in the house of an eminent plutocrat. Early in the war it was given a new lease of life in a variant ingeniously adapted to suit the new conditions. A young Territorial officer, billeted at a 'stately home,' was duly called in the morning by a gorgeous menial, and the following dialogue ensued:

*Servant*—'Tea or coffee, sir?'

*Officer*—'Tea, please.'

*Servant*—'Indian or China, sir?'

*Officer*—'Oh, China, please.'

*Servant*—'Sirupy Souchong, or Formosa Oolong, sir?'

*Officer*—'Oh, Souchong.'

*Servant*—'Sugar, sir?'

*Officer*—'Yes, sugar, please.'

*Servant*—'Demerara or Jamaica, sir?'

*Officer*—'Oh, Jamaica.'

*Servant*—'Cream, sir?'

*Officer*—'Yes, cream.'

*Servant*—'Shorthorn or Jersey, sir?'

This is a form of story which lends itself to endless decoration. 'Strong or weak, sir?' 'China or silver teapot, sir?' suggest themselves as possible additions.

But there are other stories in which brevity is absolutely essential. For example, there is the tale of the candidate for a very exclusive golf club, who, on failing to be elected, rashly wrote to the secretary, a man of somewhat brusque manners and truculent speech, to inquire whether his rejection was due to his social position or his handicap, and received a reply on a post-card, containing the single word 'Both.' It is hard to suffer fools gladly. Johnson made no effort, and even the generous Scott occasionally found it a sore trial, though it is characteristic of him that what he disliked most was the 'pap of praise.' Editors of the old school were less lavish of encomium than their successors, and it is recorded of one of them that he used to instruct his reviewers in these terms: 'Be kind, be generous, be considerate, but when you meet a silly fool string him up.'

Indiscreet hero-worship sometimes recoils with deadly results on the sincere and devout admirer. When an elderly gentleman, after helping the Duke of Wellington over a crowded street-crossing, in reply to a laconic word of thanks expressed his pride in being of any service to the foremost general of the age, the duke dryly remarked, 'Don't be a d—d fool, sir!' The duke was not without a grim sense of humour, but, unlike Nelson, he detested sentiment. He and his generals were never a band of brothers. The retort discourteous is doubly crushing when it is provoked by a compliment, and in the example quoted the rebuke was out of all proportion to the offence—if it was an offence. Genuine hero-worship may lead to grotesque results. Thus a young lady, who had long cherished an intense admiration for a great man of letters, once found that he was a fellow-guest at a garden-party, and,

greatly daring, besought the hostess to introduce her. It was done, but her courage evaporated as she was left sitting by his side. After a short but (to her) agonising silence, the old man suddenly observed, 'You lace too tight; *I can hear your stays creaking.*' Mortified by this appalling remark, she sought escape in flight, but, to her horror, found that she was being pursued. The old man, however, had not come to add to her humiliation, but to end it by this amazing apology: 'I'm very sorry. I made a mistake just now. *It was my braces.*' It is painful to be wounded in the house of our friends; still more so in the house of our idols. But genius is often *farouche*; it seldom shows the tenderness of the Chinese philanthropist of whom Mr Bramah remarks, in one of his diverting Oriental fantasies, that 'he was too considerate. He tried to knock in nails with a cucumber.' The attitude of intellect towards simplicity is generally unsympathetic; not like that of the benevolent landlord who posted in a conspicuous place on his grounds a placard with the legend: 'Trespassers will not be prosecuted.' Another placard story—a chestnut, I admit, but probably true—is that of the humorous country gentleman who protected his flowers and fruit from marauders by the terrifying notice: 'Beware of the *Lycopodium!*'

'*Il y a un Dieu pour les ivrognes,*' runs the French proverb. Latin sayings testify to the power of wine in unlocking secrets and promoting indiscreet veracity. In moderation, it is alleged to heighten the brilliancy of conversation; in excess, it muddles the wits, though it sometimes clears the tongue. Stammerers do not stammer when they have drunk more than is good for them. The once familiar saying, 'As drunk as a lord,' has now become a libel. You might with equal truth or untruth say, 'As drunk as a King's Counsel or a Labour Leader.' One need not be regarded as priggish for holding that most stories about drunkenness are neither edifying nor amusing. But I confess to being still diverted by the story of the butler who lost his balance as he was carrying a dish into the dining-room in the days when joints were carved at table. 'You drunken scoundrel!' exclaimed his irascible master, 'do you see what you've done? There's the leg of mutton on the carpet!' 'N-no, sir,' replied the culprit; 'it's on the rug.'

American humour has been recently discussed so intelligently and sympathetically by Mr Stephen Leacock in his volume of *Essays* that little remains to be said. On the whole, it is much more popular in the United Kingdom than British humour is in the United States. A few years ago in one of the leading American comic papers there was a picture illustrating various forms of torture—thumbscrews, racks, &c.—and in the place of honour was a pile of volumes of *Punch*. Just fifty years ago *Punch* invited

Artemus Ward, the leading American literary comedian of the day, to contribute to its columns, and though he was in broken health, he responded with exhilarating results in a few papers, of which that on the Tower of London is a perfect specimen of his method. Artemus Ward is not read by the present generation; to many he is unknown, and to very few more than a name. Personally, I regret immensely that I never had an opportunity of hearing his famous Lecture, though I was probably too young to have appreciated it. It is delightful to read, but the effect was greatly enhanced by his melancholy appearance and the imperturbable gravity with which he uttered the wildest absurdities. Strange to say, some of the wisest and most highly educated men were amongst his most appreciative auditors. I remember the late R. H. Hutton telling me that he never laughed so much in his life. As a writer, Artemus Ward was often extravagant; but there was nearly always a core of wholesome shrewdness in what he wrote—far more of 'horse-sense' than of grinning through a horse-collar—and in the rare moments when he was serious or righteously indignant, he could be highly impressive. He was not only a humorist of genius, but a real patriot. His grotesque spelling was quite the least important, and the most widely, because most easily, imitated, feature of his method. Of the immense and well-earned vogue of Mark Twain, and later of 'Mr Dooley,' it is not necessary to speak. American humour differs in many ways from ours, and is none the less appreciated, as a rule, on that account. It owes not a little to a calculated exaggeration, as in the answer to the question whether somebody or other had any chance of getting or doing something: 'No more chance than a cat with tallow legs would have if chased through hell by an asbestos dog.' But the common view that American humour depends solely on exaggeration is quite a mistake. The most famous American humorists owe their wide popularity to elemental qualities which are common to the great humorists of all countries, though in the form of presentation they may resort more freely to extravagant illustrations. Again, in the reign of anecdote, particularly modern anecdote, one often discovers a quality entirely removed from extravagance. In the volume of tales and sketches published by the late Sir Herbert Tree shortly before his death, he describes how an American friend complained that English people seemed wholly unable to appreciate the most characteristic American humour. Sir Herbert Tree then asked him to give a typical specimen of this characteristic humour, and his friend accordingly told a story which is duly set down, and certainly bears out the contention. It is ingenious and subtle, but probably one in five English readers would fail to see the point, and the remaining four would fail to regard it

as specially amusing. It is only fair to add that for a full appreciation of the joke, a knowledge of local customs and of the meaning attached to a certain word is essential. Americans, it may be added, excel in picturesque euphemism as well as vigorous exaggeration. What could be better than the description of a brainless beauty as being 'an invalid above the eyebrows'?

The logical reader, if he ever gets thus far,

will be fairly entitled to remark, 'Was there ever such a *non sequitur*? You fall foul of anecdote-mongers, and then proceed to inflict another budget of anecdotes on the public!' I am afraid there is no valid answer to this objection. Anecdote is not logical, and I can only hope that the inconsistency will be overlooked by those who have found any entertainment in these pages.

## THE FORESTER'S GIRL

By Mrs W. F. IRVINE BELL, Author of *John Pardon's Choice*, *Ole Cam'ron*, &c.

### CHAPTER XIII.

THEY were as merry as children. His foot being still just sufficiently painful to serve as an excuse not yet to accompany the doctor on his faithful visit to Silver Creek, Gavin had asked Anita, eagerly, boyishly, to come and help him to lose some more trout.

Anita, woman-like responding to his mood, did her part in disguising as comedy what both strove to hide from themselves and each other so perilously bordered on tragedy. So she had hurried away for her hat, then tossed it carelessly on the bed. What need of a hat in these glorious, shady woods? For after this manner was she already learning to think—this town-bred child, just coming to discover that trees are great, kind things of sweet scent and soft shadows, not things of terror secreting other terrible things!

With eager fingers she laced up her tall boots, not sparing a single thought as to whether the thick soles and broad toes made her tiny feet look twice their size. Then away she darted in the wake of the tall Englishman, looking so radiant and happy that Momma Axel, glancing up from her endless task of bread-making, suddenly felt her eyes moist with involuntary tears, and the words trembled on the thin old lips: 'Poor girl! I'm sorry for her.' Then, as the windings of the trail hid them from her sight, with a little sigh and a shake of the head she fell once more to a vigorous kneading of the soft, floury lump before her. Thus, while beneath the busy, toil-worn hands a row of plump, pale loaves took shape, presently to mingle a crisp, nutty odour with the sun-released spices of balsam and fir, a joyous trio—a man, a girl, and a red-brown dog—were crushing the pungent pine-needles below their feet, pushing their way through bush and bough, farther and farther into the illimitable forest. The pervading silence seemed to have cast its spell over the man and the girl—a spell which the dog (as dogs will), divining, mutely acknowledged by quietly falling to heel, instead of scouring far in advance, as was his wayward habit.

Gavin Barrie, erect, head a trifle high, a new

light in his eyes, his whole attitude unconsciously defiant, forsaking the well-defined trail, led the way, it mattered not *whither*. This was *his* day—and *hers*! Behind him pattered Anita Lalonne, a bright spot burning in either cheek, eyes wide and lustrous, her breath coming rather quick. Not a word had Gavin spoken to her since they set out; but that he was deliberately, pointedly, as it were, taking care of her, she could not but be aware. Now it was an impeding bough which he held aside for her to pass, now an opening to be forced through a thicket of buckthorn; his ready hand it was to steady her in the scramble up and over some huge, obstructing log; again his hand pulling her up a short, steep ravine; and then, 'Oh!' burst in mingled delight and astonishment from the girl's lips. 'How wonderful!'

They had suddenly emerged upon a section of the forest which, having from time immemorial been periodically burnt over by the Indians when this was their undisputed territory, was quite devoid of undergrowth, big timber alone surviving, each giant, majestic in height and girth, standing aloof, while here and there outcropped a great boulder in comparison with whose age the hoariest monarch of the pines was but in its infancy. Immediately beyond this wilderness park lay extended, in all the pride of proportion and infinity of colour, the wide-mouthed cañon of the Rubicon River, luminous in the morning sunshine, and mistily receding for many a mile to where, sharply outlined against a sky of intensest blue, broke, needle-like, the silver-gray peaks of the Granite Mountains, more silvery, more gray, in contrast with the one dazzling snow-burdened shoulder of Tell's Peak. 'How wonderful!' again half-breathlessly exclaimed the forester's girl, turning her glowing eyes upon the Englishman, over whose impassive face now flashed an answering enthusiasm.

'Do you like it, Anita?' he asked, adding half-teasingly in French, 'I believe you are learning to forget even Paris!' Then, as though fearful of treading on dangerous ground, he

continued in his usual unemotional manner of speaking: 'Just at the foot of those gray-looking mountains lie the rock-bound lakes in whose depths are fabled to swim trout of such unheard-of size and gameness that they have lured Dr Grey and myself half across the world. We're going to camp out on one of them as soon as we've tried our luck all round and about the Grizzly. Wish this plagued foot of mine'—— He stopped abruptly, flushing hot as Anita, her eyes dancing with mischief, burst into a peal of laughter. Barrie, despite his own discomfiture, joined in, and, the tension thus relieved between these human beings whose moods taxed the sagacity of even the most intelligent of dogs, 'Bob' took advantage to slip away on pressing business of his own. 'See!' said Gavin, 'a little farther is our old friend Bear Creek. It rises, you know, many miles away in those lakes. Would you mind coming along, so that I could fish a bit?'

Anita readily assented; but, as with light, glad step she followed him, she found herself suddenly challenged by a disquieting reflection. Never, since those peaceful hours long ago in the sheltered garden of the 'Rose d'Or,' had she felt so utterly content, so happy, so secure. And yet, on the instant, as though taking alarm at the insidious serenity of her mind, her heart began to clamour for a hearing, until flashed like lightning the naked truth upon her. Blind—blind had she been ever to imagine that for her the world could hold any man other than this one, the generous guardian of her childhood, her deliverer from a life of peril and possible shame, the fair god of all her young dreams. Almost stupefied by a rush of torturing thoughts evoked by this vivid self-revelation, Anita gradually dropped behind and stood still, lost in deep reverie, from which the voice of Gavin Barrie presently roused her.

'The trout are not taking very well,' he said; 'but I should like to have another try a little farther down. Will you rest here, and perhaps keep that scoundrel, "Bob," with you?' he added, as the dog, with a guilty air, and with dirty nose to the ground, came racing up to them, and flung himself down, panting, beside the girl.

'Yes, I will wait,' replied Anita, with a thrill of pride thus to prove to him how quickly she was learning the lesson of the woods; then, settling herself against a log and winding an arm round the dog's neck, she raised her eyes to Gavin's, saying a little wistfully, 'You won't be gone long?'

Now Gavin Barrie was no god such as Anita fondly fancied, but a very mortal man, and there had been that in the tone of her voice and the depths of her great eyes which made the lure of all the fish in California as nothing in comparison. Wherefore it required only a few fruitless casts to convince this ardent disciple of

Izaak Walton that the trout were in a bad humour, and not to be tempted with fly of his, and long before Anita had begun to think of his return, she heard him saying, as, slipping off the creel, he seated himself on the end of the log against which she was leaning, 'Can't waste time over unwilling trout *to-day*, my little Anita!' the words accompanied by an involuntary glance up at the sky, as though he begrudged the speed with which the sun-god urged his chariot towards the tree-tops. Then, after a pause, in which neither spoke, 'Are you tired?' he asked abruptly, noticing how silent was the girl's usually nimble tongue.

Anita, thus taxed, pulled herself sharply together. Not for worlds must she betray the secret of her heart so long unprobed even by herself. Springing up from her lowly seat, she perched herself jauntily on the opposite end of the log from Barrie, and glancing significantly at the empty creel, began rallying him in French for his lack of perseverance.

To this the obvious retort would have been, 'That is *your* fault,' but this was not Gavin Barrie's way. Besides, he was only too conscious that it was with a steady paddle he must steer the canoe in which he had risked embarking, lest he and Anita be swept into rapids such as even his strong will could not stem. So he merely passed some trite remark as to the perversity of fish in general, and of trout in particular, then gradually drifted into tales and anecdotes of his wanderings in pursuit of his favourite sport. Seldom given to talking of himself, he could be, once started, an interesting and graphic narrator; an easy task, too, here in the open spaces, and on his tongue the language he loved better than his own—beside him Anita as sole audience. To all appearances intent upon the rearrangement of his fly-book, he nevertheless was well aware with what eager interest she hung on his words, how her cheeks flushed and her eyes glowed, as he told of his experiences among the wild rivers of Norway, of dusky streams in Bavarian forests, of days full of joy and zest on loch or burn 'mid the heathery moors of Bonnie Scotland.

To the girl whose life had been so circumscribed—chapter one, *France*; chapter two, the Far West—these recitals had almost the glamour of fairy-tales, of which Gavin himself was the 'Prince in disguise,' while she, alas! was the merest Cinderella. Inch by inch, yet quite unconsciously, after the manner of a child eagerly listening to some wonderful story, Anita drew nearer to Gavin's end of the log, and making a lap for the head of the red-brown dog, which had followed her up and leant heavily and sleepily against her knee, began twisting the soft, silky ears in and out of her small, white fingers, her eyes fixed on Barrie, while ever and anon she urged him, with question and comment, to further unfoldings of his *Wanderjähre*.

So intent were they, so happy and absorbed in those few glad hours, which, unconfessed even to themselves, each knew to be snatched from a lifetime, that they neither saw nor heard the approach of a horseman, whose animal, showing signs of being hard ridden, he was urging along an ill-defined trail which, miles across country, joined the high-road to the Granite Mountains. Almost as spent as his horse, he nevertheless sat firm in the saddle, a happy gleam in the bright brown eyes, while he softly whistled a lively tune. By dint of spur and whip he had succeeded, despite the roughness of the trail, in persuading the weary beast into a smart trot, when all at once he pulled the creature up so sharply that the savage bit brought it sliding backwards on the slippery pine-needles, while its rider stared with incredulous eyes at a small group some hundreds of yards distant. Deadly white, the sweat breaking out on his forehead, his hand clenching the lathered lines, he gazed and gazed. Then, as the certainty of what he saw forced itself on his bewildered mind, his hand flew to his hip-pocket, half-drew something from it; then, with an oath and a smothered groan, he dropped it back, swinging himself swiftly, softly from the saddle.

He would approach them, near—very near. The bullet should make no miss. God! the man was half-frenzied. This radiant creature, looking so happy, so closely companioned with another man, alone in the depths of the forest—this—*this* was Annie—*his* Annie; the girl for whom he had lived and longed and denied himself, for whom he had laboured by day and wearied by night; the girl whom he, abject fool that he was, had pictured grudging each moment until he should come for her, weeping and fretting over the delay; the girl towards whom, sparing neither himself nor his horse, he had ridden hard since midnight, so as to surprise the love-light in her eyes!

Curse! Seizing his horse's bridle, he began leading him along the windings of the trail, now and again halting to dash the streaming sweat from his eyes, and to look again. Even to his jealous, maddened sight there was no glaring evidence of vicious intimacy with which to charge them, but rather, and perhaps more bitter still, the calm of complete content in Anita's lovely face, of a subtle understanding and *bonne camaraderie* between her and this stranger.

For an instant the impulse seized his stricken heart to turn and ride away, to abandon these two to each other, seeing that he must now be but an unwelcome third. Let Annie be happy even at cost of his own shattered life. Almost, indeed, might the forester have yielded to such

an extreme test of his love, had not the girl at that moment impulsively bent forward and laid her cheek, whose soft contour was plainly visible to her frantic lover, upon the head of a red-brown dog which leaned upon her knee and shot out his tongue in moist efforts at caress. And Anita laughed—a gay, protesting little laugh—as with her handkerchief she made pretence of rubbing away the dog's wet kiss, while the man beside her reproved and tried to coax him from her side. Anita, however, laughingly shook her head, saying something rapidly in a language which, failing to be understood by the listener, increased the impression of a close bond from which he was wholly excluded. But the sight of the red-brown dog fondled by and appropriating his girl nearly maddened the already overwrought forester. All the animosity and unreasoning prejudice dormant within him since childhood now sprang up, hydra-headed, to seize the man by the throat, and to inflame his mind with an image in which were fastastically confused the tin toy that had swallowed his scanty pocket-money, the wastrel pup gulping down precious food, and this big brown dog, his coat glossy and gleaming in the sunshine, upon which his Annie was lavishing caresses.

'One—two—three! One for each,' he whispered hoarsely, while once more his shaking fingers sought the revolver. 'One—two—three!' he repeated, stealthily drawing nearer.

But at that instant a stick snapping sharply under the shoe of the forester's horse roused Gavin Barrie's dog, already scenting the newcomers, and with a fierce bark that echoed through the silent woods, he bounded away from Anita, so startling her that she sprang to her feet with a cry of terror.

'Lie down, "Bob"! ' thundered his master, who, vexed to see the girl white and trembling, had also risen. Following with his eyes the direction beyond where 'Bob,' his coat bristling, feathery tail erect, stood growling, he discovered the stranger, who, having left his horse, was now striding towards them. 'Whew!' whistled Barrie softly; 'here's a pretty rough-looking specimen of the Wild West!' and instinctively drew nearer to the girl, laying a protecting hand upon her trembling arm.

But Anita Lalonne seemed as though she heard not. Quietly withdrawing a pace or two from Gavin Barrie, while the rich colour alternately ebbed and flowed in her cheeks, she placed her tiny hand on the head of the dog, which, not approving of the intruder's appearance, had retreated to her side, and, unflinching, turned to face David Hardy.

(Continued on page 227.)

## THE AUCKLAND AND CAMPBELL ISLANDS.

TO the south of New Zealand lie a number of islands, large and small, which are known as the sub-antarctic islands of New Zealand; they include Snares Island, the Auckland group, Campbell Island, the Bounty Islands, and Antipodes Island. Geographically speaking, Macquarie Island also belongs to these, but politically it is attached to Tasmania. It would seem that the so-called Emerald Island, Royal Company Islands, and Nimrod Islands do not in reality exist. Dumont D'Urville sought for them in vain, and more recent investigations, especially by Shackleton, go to show that there is no land whatever in the tracts of ocean where they were supposed to be. The same may be said of Dougherty Island, which was presumed to lie half-way between New Zealand and Cape Horn. When, towards the end of the eighteenth and the beginning of the nineteenth century, the islands which really exist were from time to time discovered, they were the resort of innumerable seals, and the reports of the riches which they represented attracted many a gallant ship's crew to these, the most stormy waters in the world. Many are the tragedies of which they have been the scene.

Owing to want of anchorage at all the smaller islands (only the Auckland and Campbell Islands have good natural harbours), parties of men used to be landed from the sealing-ships in order to secure and collect skins; but it frequently happened that, on account of stormy weather, the vessel, on returning, was unable to effect a landing, and the unfortunate men were left to spend an unknown length of time under the most wretched conditions. On one occasion a number of seamen spent seven years on Snares Island before relief came. About 1865 the New Zealand Government began to establish depots of provisions, &c., on all the islands; and now a ship is sent twice a year in order to replenish these, and to search for any shipwrecked men. On one of these cruises a well-known Danish scientist, Dr Phil. Th. Mortensen, was accommodated with a passage, and as a result he recently delivered, before the Royal Geographical Society in Copenhagen, an interesting lecture, of which the following is a summary.

More than ordinary interest attaches to the exploration of these islands on account of their position half-way between New Zealand and the south polar lands. They appear to represent the remains of the old land connection between the Australian and the Antarctic Continent, which nearly all the scientists who have studied the animal and plant life of the southern hemisphere are of opinion must have at one time existed. On November 17 the training-ship *Amokura*, with the professor on board, sailed southwards from Inverrarron, but so stormy was

the weather that a stay of nearly a week had to be made at Stewart Island. Here the climate is so severe that cultivation is out of the question, and the New Zealand Government has converted nearly the whole island into a National Park for the preservation of the indigenous animals and plants. The forest with which it is covered is primeval and practically untouched. It is full of beautiful tree-ferns; and there is a varied and abundant bird life—which includes a species of kiwi (*Apteryx Laurys*) unknown elsewhere.

On November 23 a course was steered for Snares Island; but the weather became again so bad that a landing was impossible. Through the glasses the large colony of penguins which exists there could be made out. Having ascertained that neither here nor at Disappointment Island were there any castaways, the vessel now sailed along the precipitous and inaccessible wall of rock which forms the northern coast of Auckland Island to Port Ross, a large bay with excellent anchorage. At Carnley Harbour, the next port of call, a heavy gale blew, with snow and hail, although it was midsummer; on December 7 Campbell Island was reached; and a week later the voyage terminated at Akaroa Harbour in New Zealand.

The Auckland group, which consists of six large islands—by far the most extensive of which is Auckland Island itself—and some half-score of small ones, lies about two hundred and ninety miles from the southern point of New Zealand, and has an area of three hundred and thirty square miles. Campbell Island and the adjacent islets are only about sixty square miles in extent. Both groups are mountainous, some of the tops attaining a height of two thousand feet, but none is covered with snow throughout the entire year.

The whole of the north, south, and west coasts of the Aucklands consist of steep, bare, inaccessible precipices, and their aspect is far from hospitable; but at Port Ross and Carnley Harbour the land slopes gradually down to the water's edge, and conveys the impression of great fruitfulness. In 1849 an attempt to colonise the islands was made, but a couple of years were sufficient to prove its futility. The climate would not seem to have been sufficiently taken into consideration. The rainfall and snowfall are enormous. On Campbell Island in 1905 there were two hundred and sixty rainy days, with a fall of over fifty-three inches; in 1906 there were two hundred and eighty rainy days, with a fall of over fifty-six inches. The ground everywhere from the coast up to the tops of the hills is of a boggy character, and consists exclusively, sometimes to a depth of thirty feet, of the remains of plants, and the water which flows from it in

innumerable streams is quite brown and full of humic acid.

The forests are composed for the most part of the so-called rata or ironwood tree (*Metrosideros lardii*), a member of the myrtle family; it has large, dark-green, leathery leaves, and in January and February it is covered with masses of red bloom. *Olearia Lyalli*, a tree whose young shoots and leaves are covered with a close white film for protection against evaporation, is numerous represented also, as is *Dracophyllum longifolium*, a tree which, with its long, spike-formed leaves, is reminiscent of the fir, but has pretty white blossoms which grow in clusters somewhat like the lily of the valley.

A remarkable feature in these woods is the way in which the trees, especially the rata and the olearia, grow for nearly half their length along the ground. This is due to the constant winds, and the result is a chaos which can only and with great difficulty be penetrated by following the tracks made by the sea-lions. The rata-trees attain a thickness of over three feet and a height of thirty to forty feet. At their tops they send forth numerous branches, which form a canopy of leaves so dense that underneath the air is quite still, however hard it be blowing overhead. Here a luxuriant vegetation of quite another character flourishes—plants which are not at all suited to resist great evaporation, more especially a multitude of ferns, from quite small, almost moss-like forms (*Hymenophyllum*) to large tree-ferns, which have here their southern limit. Up towards the hill-tops the trees become more and more insignificant, until they form a low thicket, which ultimately gives place to a vegetation consisting mainly of grass. This grass, however, does not grow in the ordinary way; it forms tussocks five to six feet high, between or over which it is extremely difficult to walk.

The animal life on the island is also remarkable. As in New Zealand, there are no indigenous mammals, but a number have been introduced. When it was discovered by Captain Bristow (in August 1806), some pigs were released upon it, and these, although not always visible, are now plentiful, to judge from their tracks in the woods. Cattle have been tried, but the dampness of the climate proved too much for them. Goats did better, but most of these fell victims to the half-wild dogs, of which there are many. Sheep-breeding, too, has proved unsuccessful on the Auckland Islands; but on Campbell Island it is still conducted on a modest scale.

None of the creatures introduced by man have affected the animal life of the Auckland Islands; it is the sea-lions which give it character. These huge beasts, which are nearly as big as walruses, are very partial to going ashore for the purpose

of sunning themselves, and the woods are full of their paths. They make their way up the steepest ascents and through the densest tree growth, and may frequently be met with sleeping in open spaces far from the sea. Here the young are born—as a rule in February; and they also frequent the tracts of meadow at the head of the bays. Formerly they could be seen in such places in hundreds; but their numbers have been greatly reduced by the professional hunters. The skin only is taken, and the carcass is left to rot. The species of sea-lion (*Arctocephalus Hookeri*) above referred to is the only one which is now numerous on the islands. Another, the fur-seal (*Arctocephalus Forsteri*), used to be very plentiful. Some years ago, when, on account of the value of its skin, it had become nearly exterminated, the New Zealand Government prohibited its capture. In the course of a few years it had again increased considerably in numbers, and the prohibition was withdrawn, the result of which was that it has now almost ceased to exist. Two other animals of the seal species are found on the islands, the sea-elephant and the sea-leopard, but only in small numbers.

The bird life is abundant and interesting. In the woods the pretty tui, or parson bird, is common, and so tame that it can almost be taken with the hand; so also are the parrots, of which there are three varieties in the Auckland Islands. Much more numerous than the land birds, however, are the sea fowl; and albatross, penguins, fulmars, gulls, skuas, cormorants, &c. breed on the islands. On the shore in the neighbourhood of Carnley Harbour are quantities of a large kind of mussel; at low-water they lie buried in the sand. The shell is very hard and thick, but the gulls solve the difficulty of getting at the contents by flying up with them to a considerable height and dropping them on to the rocks, where they are smashed. The big skua, *Catharacta antarctica*, is a prominent member of the bird community, and a robber of the worst kind. It attacks the gulls and appropriates the fish which it has compelled them to disgorge; it drags the fulmars from their nests, and kills and eats them and their eggs; and it even picks out the eyes of sick sheep. Cormorants are numerous. One species, *Phalacrocorax colensoi*, exists only on the Aucklands; and a species of duck, *Nesonetta Aucklandica*, which has nearly lost the power of flying, is only found here. No fewer than four kinds of albatross breed on the islands. They nest in large numbers among the tussocks on the hills, each species keeping apart from the others. They are so tame that they will hardly move from the nest when approached, and the New Zealand Government has found it necessary to prohibit the taking of their eggs.

## THE METHODS AND MEANINGS OF MASCOTS.

By PHILIPPA FOREST.

**M**ASCOTS and charms have a great vogue nowadays, for propitiation of the gods of luck is never more fervent than when the gods of war are tossing Fate's dice-box. And belief in them is not by any means confined to any one section of the people. It ranges from the highest to the lowest. Queen Alexandra is said to treasure one of the finest collections of crystal globes in the world. It contains one that belonged to the great Napoleon, which is said to be weirdly accurate in the pictures it presents. The Dowager Empress of Russia, her sister, is also very much interested in 'charms,' and never travels without several favourite mascots hung about her somewhere. The late King Edward was a believer in the luck-bringing powers of the horse-shoe, and his favourite gift to a bride was a jewelled device of this kind. And every one knows that a search amongst our soldiers would bring to light many a cherished mascot in the shape of a lucky coin, horse-shoe, or some other magical talisman. As for the 'swastikas,' miniature horse-shoes, 'touchwoods,' 'fumsups,' and other charms worn by Tommy's wives and sweethearts—their name is legion! Indeed, it is said that the inventor of one popular mascot has sold nearly two millions since the war began.

This belief in the power of charms and amulets is by no means a new one. It harks back to very early times, and probably originated with the claim made by the priests of ancient religions to be able to influence the gods by their prayers and incantations. The worshippers naturally clamoured for some substitute for this power that could be carried about for use in times of danger, and the priests discovered that it was easy and profitable to transfer the incantations in writing or hieroglyphs to various substances. Rough images of the gods were added as time went on, which gradually developed into ornaments of gold, silver, and bronze. Thus the idea of protection and good luck became associated with certain symbols and metals—and 'that is all there is in it,' say the common-sense folk, who look down on 'silly superstitions.' But the devotees who touch wood whenever they boast of good fortune, or turn their money three times when they see the new moon, claim that many things happen that cannot be explained away in this severely rational fashion. There is a vast body of evidence which proves that certain gems and devices *do* bring good or ill luck, they say.

The story of the famous Spanish opal ring would seem to bear witness to the truth of this contention. Certainly the long arm of coincidence would have to be stretched a preposterous length to embrace the series of fatalities that

followed its advent. This ring belonged to the beautiful Comtesse de Castiglione, who flourished in the reign of Napoleon III. Among her admirers was Alfonso XII., then an outcast and a pretender. Events brought him to the throne, and he married a princess of royal blood. The jealousy and hatred of the comtesse was aroused. She sent an opal ring of rare beauty as a wedding-gift. The king gave it to his bride, Queen Mercedes, who from that moment commenced to ail, and died after a few months. It was then given by Alfonso to his grandmother, Queen Christina, who also succumbed a few months later. The king's sister, the Infanta Maria del Pilar, next wore it, and she perished in a few days of a mysterious sickness. The youngest daughter of the Duc and Duchesse de Montpensier was the next victim, and after this list of tragedies the king determined to keep the ill-omened jewel to himself, but his unhappy life came to an end shortly after he slipped it on his finger. His second wife, Queen Christina, then took possession of it, and placed it on the breast of the statue of the Virgin of Almudena, where it remains to this day.

Spain possesses another gem of deadly potency, though its history is not so well known as that of the opal. 'Mephisto's ring,' as it is called, contains a large and beautiful emerald. It came to Spain—no one knows how—in the reign of Philip II., and brought in its train the succession of calamities which resulted in the decline of Spanish power. At the time of the Spanish-American war it was presented by the royal family to a church, which was shortly afterwards burned to the ground. The ring was saved and given to a museum, which was struck by lightning; so the ill-fated jewel was returned to the royal family, 'with thanks.' Following swift on its return came the news of the defeat of the Spanish army and navy. The ring has now been placed in a strong-box and buried.

From the time of Tubal Cain and Solomon rings appear to have been associated with the destinies of kings and leaders of men. The far-famed 'Solomon's Seal' is said to have been a ring in which were imprisoned spirits who fulfilled their master's commands. Apollonius of Tyana changed his rings daily, using one with a correct jewel for every day in the week. According to a document in the Rolls House, Cardinal Wolsey possessed 'such a rynge that whatsoever he askyed of the Kynge's Grace that he hadd yt.'

To come down to the present time, the ex-Tsar of Russia is said to hold in great reverence a ring in which is embedded a piece of the true Cross. This is supposed to have the virtue of

shielding its wearer from any physical danger, and the value the ex-monarch sets upon it is shown by the fact that he will never move any distance without it. Once, when he had started on a journey minus his amulet, he had the royal train held up for eight hours while a special messenger went back to Petrograd for it. It is said that the only occasion on which his ill-fated grandfather neglected to wear it was the day on which he was assassinated. One wonders if the revolutionaries have been merciful enough to leave it with him; for he will surely need all the comfort he can get from that, or any other, possession in the direful days on which he has fallen!

The mascot of the House of Hohenzollern is also a ring which has a very curious history. It is set with an ugly black stone—a very fitting symbol, one would think—which, legend relates, was dropped by an enormous toad on the bed of the wife of the Elector John of Brandenburg immediately after she had given birth to a son. The toad then mysteriously disappeared. The stone was set in a ring which has been worn on state occasions ever since by the head of the Hohenzollerns. It is stated that the present Kaiser will not enter upon any important engagement unless he is wearing it. It is mentioned officially in many of the archives of Berlin.

Mascots are usually regarded as being individual in their influence, but there are a few which wield a much wider power. The Coronation Stone, for instance, is said to be associated with the fate of Scotland, and may be regarded as a national mascot. It was forcibly removed from Scone, in Perthshire, by Edward I. to Westminster Abbey more than six centuries ago. The hooks by which it was lifted still remain. It will strike most people as a curious coincidence, if nothing else, that it was slightly injured—for the first time for centuries—by an explosion in Westminster Abbey a few months before the present war broke out.

Some curious stories are also attached to the stones of Stonehenge, one of which is that one of the large stones falls when a sovereign dies. Certainly it is undeniable that one fell a few days before the death of Queen Victoria.

The mascot of the Jewish nation is a large sapphire which is kept in the very centre of the Sacred Ark. It is guarded by the high priest with the greatest care, and it is a popular belief that it changes in colour and brilliance when any event of importance to the Jewish people is imminent.

The black stone of Mukden is associated with the destiny of the Chinese Empire. It is an ordinary shaft of black basalt a few feet high, set beside the chief gate of the Imperial Palace of Mukden, and is said to have mysteriously disappeared during the revolution, in accordance with the belief that when it was

lost the Manchurian dynasty would lose the throne.

Individual mascots are almost as varied as individuals, and range indiscriminately from an old shoe to a sprig of white heather or a scrap of Egyptian mummy. They cannot be classified under any known rule, for in the realm of luck, as in that of dietetics, 'what is one man's meat is another man's poison.' A certain trinket or article of dress is dubbed 'lucky' if it happens to have been worn when a special piece of good fortune befell the wearer, and is sported constantly afterwards in the hope that it may attract Dame Fortune's eye again. Or a gift is bestowed with goodwill and affection, and as every one nowadays acknowledges the power of thought, it is felt to be a magnet attracting to the receiver all that is desired by the giver. Therefore, while some people would confidently expect the skies to rain misfortune on them if they wore an emerald or opal or a pearl, others would never dream of engaging in any important business without their opal or emerald mascot well in evidence.

The origin of the baleful repute of the opal is not positively known, but it probably dates back to the time when the plague was rife in Venice some three or four centuries ago. This beautiful stone was then a particular favourite with the Venetians, and it was noticed that when a victim was at the point of death his ring—if he wore one—brightened, and after death became dull. As this implied a sort of malignant intelligence in the stone, it was charged with bringing about the death of the owner; whereas it was really the patient who influenced the gem. The heightened fever caused it to become more brilliant, and the chill and damp of dissolution afterwards dulled it.

Amongst luck-bringing devices horse-shoes undoubtedly hold pride of place. Various explanations are given as to the origin of their power, but that which ascribes it to the witch-protecting properties of iron is probably the right one. It used to be confidently believed that no witch could enter a building over or under iron, and in many parts of the north of Scotland nails and horse-shoes are, to this day, fastened to the door of a room in which a mother and a new-born child lie, to prevent the entrance of witches and the 'little people.' Nelson is said to have had faith in the luck-bringing powers of the horse-shoe, and nailed one with his own hands to the mast of the *Victory*. Commander Holbrook, who took the B11 on that marvellous expedition under the Dardanelles, and returned safely to his base after sinking a Turkish warship, is also a believer in this emblem, for he fastened a horse-shoe that was sent to him by an admirer to the bulkhead of the B11.

The King and Queen have also recognised this popular superstition by giving a box of tobacco

stamped with a horse-shoe and the words, 'Good luck to a brave man,' to a large number of wounded soldiers.

It is worthy of note that many of the charms carried by soldiers are made of hard metal, 'And are therefore calculated to gain a reputation for luck by turning the course of a bullet,' say the scoffers. But Tommy would never admit that this was the foundation of his belief in his cherished horse-shoe or rusty nail. When his mascot does turn a death-dealing missile, it is its magical, not its resisting, qualities that are responsible, and any one who tried to convince him to the contrary would not be popular.

Nearly all gamblers place faith in a lucky coin, and jealously treasure one with which to win a toss. This superstition is a debased form of the ancient belief in the power of talismanic discs—that is, coins that were engraved with secret Hebrew 'words of power.' The mascot of the Rothschilds is said to be a coin which is kept in a small gold casket by the head of the house. The power lies in the words that are inscribed on it.

Most actresses and actors possess a favourite mascot. Madame Sarah Bernhardt's is a necklace of nuggets that was given to her by some Californian miners a good many years ago. Miss Irene Vanbrugh is said to pin her faith to a girdle of uncut turquoises, and wears it always on 'first nights.'

Green is supposed to be a very unlucky colour, but it has a contrary effect when it is worn in a stone or an ornament, a fact that accounts for the popularity of jade as a material for charms and amulets. The late Mr Leopold de Rothschild was very much attached to a little green stone carved in the shape of a Hindu god, and attributed his luck in winning the Derby some years ago to its influence. Mrs Nicholas Longworth's—*née* Miss Roosevelt—favourite ornament is a beautiful jade necklace which was given to her by the late Dowager Empress of China. The empress declared that the stones had been cut by an artist who had the reputation of being a wizard, and that the necklace would bring to its owner her heart's desire. As Miss Roosevelt soon afterwards met her present husband, she is said to have confided to a friend 'that there was perhaps something in it.' Sir H. Rider Haggard places great value on a quaint signet ring set with a green stone, which once adorned the finger of that Pharaoh who made Israel captive. He regards it as a powerful mascot, and always wears it when at work on his novels.

Some people are considered to be lucky or the reverse to those with whom they are brought into close contact, just as some animals are. Lady Bancroft was always credited with the power of bringing good luck, and her friends used to beg some object that she had worn when

they were entering on a hazardous adventure. There is no doubt that sailors in particular believe in lucky and unlucky persons, and nothing will induce the majority of them to sail with a man who has the reputation of being a 'Jonah.'

Where animal mascots are concerned, black cats undoubtedly head the list. A theatrical company will grow hysterical with joy if a black cat strolls across the stage on the first night of a new play! Many people, on going to live in a new house, will meanly try to coax a black cat over the threshold with milk or other dainties, but experts say that the entrance must be a voluntary one if good luck is to ensue. Black cats are carried on hundreds of ships and yachts, and several are at the front in the official capacity of regimental mascots. Other regiments have adopted bears or goats, and loud is the lamentation when any misfortune befalls the guarded pets. The Canadians brought with them four young black bears, but wisely decided to take no chances with them at the front, so they were despatched on board wages to the Zoo. That they may soon be able to escort their triumphant friends home again will be the heart-felt wish of all—a wish that in itself will prove a powerful mascot. For, if the ancient sorcerers are to be believed, it is 'the will behind the word' that gives the magical power to any spell or charm.

## HOMeward BOUND.

### I.

#### SPES LOQUITUR.

To-NIGHT your weary eyes shall see once more  
The village nestling 'neath the headland's height,  
And love shall greet you at the open door  
To-night.

To-night the pale moon's glories, pure and white,  
Rest on the sea and strow its shadowy floor  
With rippling silver, tremulous in the light

That flames from misty shore to misty shore.  
On! gallant ship, and speed thee in thy flight,  
And toil shall cease and peril shall be o'er  
To-night.

### II.

#### FLOTSAM.

Hidden away in the rocks' recesses,  
Drear and lonely a tiny bay  
Sleeps, where none but the fisher guesses  
Hidden away.

Hither, thither its waters sway,  
Lightly curled by the wind's caresses,  
Faintly flushed by the dying day.

Wave on wave through the narrows presses  
Shoreward, bearing its secret prey  
In the coil of the seaweed's tresses  
Hidden away.

## SEVENTH SERIES

### A STATE IN MINIATURE.

By BART KENNEDY.

I SAW a figure coming along the *camino* (path) in the distance. Surrounding me were the great lone mountains—the Pyrenees. It was near to the end of October, and for days I had been tramping with my pack on my back through Catalonia.

This approaching figure turned out to be a man, a man great and tall and broad, with blue eyes and light-brown hair. We stopped and looked straight at each other, and raised our hats. Politeness reigned here in these lone mountains.

He was an Andorran, one of the men of Andorra, the little republic that for more than a thousand years had existed here in the heart of the Pyrenees. Conquerors have come and gone, Napoleon has come and gone, but the men of Andorra have lived free from thrall or yoke.

I asked him in the patois of the Catalan if I had passed the frontier, if I had got into Andorra!

He turned round and pointed to a great rock some two hundred yards ahead. When I had passed that rock I was in Andorra, I was across the *frontera*! And again we saluted each other and went on our different ways.

How wonderful and clear and bracing was the air here in the mountains! It was stimulating as some rare, magical wine. I was thrilled with the joy of life as I walked along. The sound of the rushing river, the Balira, came to me; and high above in the blue hung great birds—eagles. It was a scene wild and splendid and strange, and the sound of the river but brought out the sense of surrounding silence. These great snow-clad mountains had been here long, long before the Romans had penetrated through this wild pass. Indeed, they had been here long, long before man himself had come into the world; and well it might be that they would be here when man himself was gone.

I was walking quickly by the east bank of the river. My desire was to get to the town of Andorra before darkness fell.

The path had now become difficult. In places I had to use my hands in climbing. And one, at least, of the reasons of Andorra's freedom came to me. The country of the Andorrans would be a most difficult one for a campaign.

An enemy would have to cope with enormous natural difficulties. And if he took the country, what then? He would simply be in possession of a chain of almost sterile valleys some thirty miles long.

I came to a bend in the pass, and I saw in the distance, through the clear air, the tops of houses. It was the little village of St Vincent.

Soon I came up to it, and was passing through it. The houses were low and strong-walled, and lying upon the roofs and hanging through the open windows were great bunches of tobacco-leaves. They were drying, and they filled the air with a pungent odour.

The people were standing at their doors, gazing upon the passing stranger. They courteously returned my salutation. The men were much like the man I had seen just before I crossed the frontier—great, powerful men with fresh-coloured faces and blue eyes. They looked very much like Yorkshiremen, but bigger. They were utterly different from any of the men of Spain. The women, however, did not seem to have the good looks of the women of Spain. But these men were magnificent.

I had inquired a great deal concerning them. But no one seemed to know from what race they had come. When or how they had come to inhabit this small chain of valleys in the Pyrenees no one could tell. But speculations concerning them passed from my mind as I went along.

The next place I came to was San Julian. It was a trifle larger than the last place, but the people and the general scene were much the same. Again I was struck by the great size of the men. I stopped here at the little *posada* (inn) and refreshed myself with a pint of stout red wine, for which I paid ten *céntimos* (less than a penny). It was good, strong wine, hailing, if I mistake not, from northern Catalonia. And after I had quaffed the initial pint I had one to follow, for luck. Not to sample the wine of the country through which one is passing smacks of impoliteness.

Again I was going quickly along. By this time the sun was not too high up above the mountains, and it would take me all my time to make Andorra before the darkness came. The path, as I have suggested, was one that

stamped with a horse-shoe and the words, 'Good luck to a brave man,' to a large number of wounded soldiers.

It is worthy of note that many of the charms carried by soldiers are made of hard metal, 'And are therefore calculated to gain a reputation for luck by turning the course of a bullet,' say the scoffers. But Tommy would never admit that this was the foundation of his belief in his cherished horse-shoe or rusty nail. When his mascot does turn a death-dealing missile, it is its magical, not its resisting, qualities that are responsible, and any one who tried to convince him to the contrary would not be popular.

Nearly all gamblers place faith in a lucky coin, and jealously treasure one with which to win a toss. This superstition is a debased form of the ancient belief in the power of talismanic discs—that is, coins that were engraved with secret Hebrew 'words of power.' The mascot of the Rothschilds is said to be a coin which is kept in a small gold casket by the head of the house. The power lies in the words that are inscribed on it.

Most actresses and actors possess a favourite mascot. Madame Sarah Bernhardt's is a necklace of nuggets that was given to her by some Californian miners a good many years ago. Miss Irene Vanbrugh is said to pin her faith to a girdle of uncut turquoises, and wears it always on 'first nights.'

Green is supposed to be a very unlucky colour, but it has a contrary effect when it is worn in a stone or an ornament, a fact that accounts for the popularity of jade as a material for charms and amulets. The late Mr Leopold de Rothschild was very much attached to a little green stone carved in the shape of a Hindu god, and attributed his luck in winning the Derby some years ago to its influence. Mrs Nicholas Longworth's—*née* Miss Roosevelt—favourite ornament is a beautiful jade necklace which was given to her by the late Dowager Empress of China. The empress declared that the stones had been cut by an artist who had the reputation of being a wizard, and that the necklace would bring to its owner her heart's desire. As Miss Roosevelt soon afterwards met her present husband, she is said to have confided to a friend 'that there was perhaps something in it.' Sir H. Rider Haggard places great value on a quaint signet ring set with a green stone, which once adorned the finger of that Pharaoh who made Israel captive. He regards it as a powerful mascot, and always wears it when at work on his novels.

Some people are considered to be lucky or the reverse to those with whom they are brought into close contact, just as some animals are. Lady Bancroft was always credited with the power of bringing good luck, and her friends used to beg some object that she had worn when

they were entering on a hazardous adventure. There is no doubt that sailors in particular believe in lucky and unlucky persons, and nothing will induce the majority of them to sail with a man who has the reputation of being a 'Jonah.'

Where animal mascots are concerned, black cats undoubtedly head the list. A theatrical company will grow hysterical with joy if a black cat strolls across the stage on the first night of a new play! Many people, on going to live in a new house, will meanly try to coax a black cat over the threshold with milk or other dainties, but experts say that the entrance must be a voluntary one if good luck is to ensue. Black cats are carried on hundreds of ships and yachts, and several are at the front in the official capacity of regimental mascots. Other regiments have adopted bears or goats, and loud is the lamentation when any misfortune befalls the guarded pets. The Canadians brought with them four young black bears, but wisely decided to take no chances with them at the front, so they were despatched on board wages to the Zoo. That they may soon be able to escort their triumphant friends home again will be the heart-felt wish of all—a wish that in itself will prove a powerful mascot. For, if the ancient sorcerers are to be believed, it is 'the will behind the word' that gives the magical power to any spell or charm.

## HOMeward BOUND.

### I.

#### SPES LOQUITUR.

To-NIGHT your weary eyes shall see once more  
The village nestling 'neath the headland's height,  
And love shall greet you at the open door  
To-night.

To-night the pale moon's glories, pure and white,  
Rest on the sea and strow its shadowy floor  
With rippling silver, tremulous in the light

That flames from misty shore to misty shore.  
On! gallant ship, and speed thee in thy flight,  
And toil shall cease and peril shall be o'er  
To-night.

### II.

#### FLOTSAM.

Hidden away in the rocks' recesses,  
Drear and lonely a tiny bay  
Sleeps, where none but the fisher guesses  
Hidden away.

Hither, thither its waters away,  
Lightly curled by the wind's caresses,  
Faintly flushed by the dying day.

Wave on wave through the narrows presses  
Shoreward, bearing its secret prey  
In the coil of the seaweed's tresses  
Hidden away.

### A STATE IN MINIATURE.

By BART KENNEDY.

I SAW a figure coming along the *camino* (path) in the distance. Surrounding me were the great lone mountains—the Pyrenees. It was near to the end of October, and for days I had been tramping with my pack on my back through Catalonia.

This approaching figure turned out to be a man, a man great and tall and broad, with blue eyes and light-brown hair. We stopped and looked straight at each other, and raised our hats. Politeness reigned here in these lone mountains.

He was an Andorran, one of the men of Andorra, the little republic that for more than a thousand years had existed here in the heart of the Pyrenees. Conquerors have come and gone, Napoleon has come and gone, but the men of Andorra have lived free from thrall or yoke.

I asked him in the patois of the Catalan if I had passed the frontier, if I had got into Andorra!

He turned round and pointed to a great rock some two hundred yards ahead. When I had passed that rock I was in Andorra, I was across the *frontera*! And again we saluted each other and went on our different ways.

How wonderful and clear and bracing was the air here in the mountains! It was stimulating as some rare, magical wine. I was thrilled with the joy of life as I walked along. The sound of the rushing river, the Balira, came to me; and high above in the blue hung great birds—eagles. It was a scene wild and splendid and strange, and the sound of the river but brought out the sense of surrounding silence. These great snow-clad mountains had been here long, long before the Romans had penetrated through this wild pass. Indeed, they had been here long, long before man himself had come into the world; and well it might be that they would be here when man himself was gone.

I was walking quickly by the east bank of the river. My desire was to get to the town of Andorra before darkness fell.

The path had now become difficult. In places I had to use my hands in climbing. And one, at least, of the reasons of Andorra's freedom came to me. The country of the Andorrans would be a most difficult one for a campaign.

No. 330.—VOL. VIII.

An enemy would have to cope with enormous natural difficulties. And if he took the country, what then? He would simply be in possession of a chain of almost sterile valleys some thirty miles long.

I came to a bend in the pass, and I saw in the distance, through the clear air, the tops of houses. It was the little village of St Vincent.

Soon I came up to it, and was passing through it. The houses were low and strong-walled, and lying upon the roofs and hanging through the open windows were great bunches of tobacco-leaves. They were drying, and they filled the air with a pungent odour.

The people were standing at their doors, gazing upon the passing stranger. They courteously returned my salutation. The men were much like the man I had seen just before I crossed the frontier—great, powerful men with fresh-coloured faces and blue eyes. They looked very much like Yorkshiremen, but bigger. They were utterly different from any of the men of Spain. The women, however, did not seem to have the good looks of the women of Spain. But these men were magnificent.

I had inquired a great deal concerning them. But no one seemed to know from what race they had come. When or how they had come to inhabit this small chain of valleys in the Pyrenees no one could tell. But speculations concerning them passed from my mind as I went along.

The next place I came to was San Julian. It was a trifle larger than the last place, but the people and the general scene were much the same. Again I was struck by the great size of the men. I stopped here at the little *posada* (inn) and refreshed myself with a pint of stout red wine, for which I paid ten *centimos* (less than a penny). It was good, strong wine, hailing, if I mistake not, from northern Catalonia. And after I had quaffed the initial pint I had one to follow, for luck. Not to sample the wine of the country through which one is passing smacks of impoliteness.

Again I was going quickly along. By this time the sun was not too high up above the mountains, and it would take me all my time to make Andorra before the darkness came. The path, as I have suggested, was one that

[All Rights Reserved.]

MARCH 9, 1918.

could only be safely negotiated in the light of day. Upon it were all sorts of obstructions, and at times it ran uncomfortably near the edge of the rushing Balira.

Two hours passed, and it seemed to me now that I could not be far from Andorra. I kept one eye on the path and the other on the sun, for when the sun was gone I was without my guide and friend. I would most likely have to spend the night on the soft side of some rock or another. It was a prospect in which there was little to enchant.

The sun was now a great globe of red gold. It looked very beautiful, but its beauty filled me with sorrow. For I knew this softening, wonderful beauty meant that it was going to leave me.

It did leave me. It was gone! It fell with suddenness behind the top of a great mountain.

I pressed on now as quickly as I could, for I knew that depending upon the twilight was like depending upon a reed that was not only very slight, but very short. And my knowledge was correct, for darkness suddenly tumbled upon me.

I was done for. There seemed nothing for it now but to camp out in the cold with philosophy. But philosophy under the circumstances was but a cheerless bedfellow, and at last I came to the conclusion that it would be better for me to go cautiously on—to feel my way, as it were. It was dangerous, but life itself is but one danger after another! If I kept on, I should in time get somewhere or another, providing I did not fall and break my neck or tumble into the rushing, roaring Balira.

On and on I went, and on and on. How I managed not to come to a sudden and disastrous end I know not. But I managed somehow. Providence has usually a kindly eye for the reckless.

On and on. The sound of the river filled the darkness. But I did not allow myself to get nervous. It would not have helped me. The only thing to do was to go along, and trust to luck. If I had stopped and lain down, I might, for all I knew, be frozen stiff before the light of the morning came. For, though it was not very cold, it was the season of the year when the temperature in the Pyrenees takes sudden drops. In a few hours it might be down below zero. It was better to go cautiously on.

Suddenly what seemed to be a spark appeared out in the darkness. But it disappeared; and then it appeared again. This time it did not go away; it kept its place steadily, and I knew now that it was a light.

I still kept going along cautiously, and another light came—and another. I was surely coming upon Andorra!

All at once I stumbled, falling head over heels. I had forgotten that lights in the distance by no means meant light on the path.

After I picked myself up, I made my way more carefully.

I came at last to a bridge. I crossed it slowly in case there might be a gap in it that would let me down into the river.

The lights were shining strongly now, and I went boldly forward; and soon I was in the midst of the dim shapes of the houses.

There! That must be the *posada*! That house with the windows full of light! From it were coming great, deep sounds of laughter.

I went up to it, and opened the door, and entered.

It was the *posada* right enough. Men were sitting around a great table with measures more or less filled with wine in front of them, and they were laughing and talking loudly in Catalan, I presume about nothing in particular. They were great, bulky men with immense shoulders.

The landlord came forward and helped me off with my knapsack. He was the biggest man I had ever seen, and his smile of welcome was as large as himself.

Getting to this *posada*, after the rough and very much tumble march of the day, was like getting home. I was more than pleased to think that my bed would not be the soft side of a rock, after all; and when I had got on the outside of a pint of wine I was ready for supper.

It was a fine supper. It consisted of a roast partridge with delicious gravy, sliced tomatoes, good light bread, and more wine. Whilst I was eating, the immense landlord entertained me with polite conversation, or, to be more exact, he asked me all kinds of questions, which I answered as well as I could, between bites. His voice was of the deep, jovial, booming order.

My knowledge of Catalan was somewhat sparse, but I helped it out with gestures. A gesture is always worth its salt for conversational purposes. It matters not where you are, it is a coin that always passes.

And then I went to bed, and slept the sleep of the just.

Dream? Why, of course I dreamed. I saw hordes of big, immense fighting-men. They were marching somewhere—where I could not tell. I was amongst them. I was one of them. My huge landlord was the commander of the host, and I was one of his soldiers. At times I was in camp; at times I was in a vast, wonderful city; at times I was on the march. All at once I found myself in the thick of a battle, and something struck my shield a great blow. It sounded and sounded, and I awoke. The landlord was pounding on the door. It was time for me to get up. The commander himself had brought me the coffee!

After a little I got up, and sluiced myself as well as I could with water from a jug that was not too large; but it served, and soon I was ready for breakfast.

It was a fine, hearty breakfast—*jamon* (ham) and *huevos* (eggs), and again sliced tomatoes, and coffee and bread and cheese. And the commander was to the fore, entertaining me with conversation in his great, deep voice. This time he was telling me many things the drift of which I could not quite get. But my face wore an expression at once knowing and polite, and all was well. He wore a cap and a blue, somewhat weather-beaten smock. He was not the person of my dreams, but he looked as if he might easily be so. For all his good-humour and his friendliness, he looked like a man who could knock a house down if he felt so disposed. There were many things I would have done in preference to fighting my host.

After breakfast we went together for a saunter around Andorra, the capital of the miniature republic. In the sunlit morning it looked picturesque and beautiful, a little town centred here in the great mountains.

But the landlord by no means felt that it was a little town. He looked upon it as one of the world's great towns—which it was surely enough, for in it were the finest men I had ever laid eyes upon! He told me of its wonders and its greatness in the patois of the Catalan. He showed me the places of interest, and explained everything in detail. I must confess that I did not grip all the details, but I gripped the general drift, and this, combined with my use of gesture and my natural politeness, made him feel that I understood fully his explanations. At least, I hope I made him feel this, for he in

turn may have been polite enough to overlook my misunderstandings.

Andorra had the look of a place that had been built by men used and broken to fighting. Its houses were low and strong of wall, and it stood at a part of the pass that could easily be defended. Towns are always the expression of the temperament of the people who build them.

High in the clear blue above it hung the eagles, motionless, as if on guard.

It was now well on in the morning, and I felt that the time had come for me to go. I wanted to be on my way through the mountains.

Miguel Calounes—that was the landlord's name—did not seem to like the idea of my going. But the call of the going along was imperative, and I insisted. I packed my knapsack, and I asked him what the score was. He shook his head. He would take nothing. In the end, however, after a great deal of persuasion, he took four *pesetas*. This big Calounes was truly a landlord of a kind most rare!

I shook hands with him, and soon I was out beyond the town, going north along the *camino* towards the summit of the Pyrenees.

I was wondering if I should ever again pass that way. Should I ever again find myself in the country of this people of Catalan stock? Should I ever again see Miguel Calounes? I wondered.

The afternoon had come. I was now high up in the mountains, and I turned and looked south; and a long way off, through the clear air, I could see the spire of the little chapel of Andorra.

## THE FORESTER'S GIRL

### CHAPTER XIV.

OF the numerous psychological contradictions to which man is subject, the most common, perhaps, is the curious propensity with which his mind, at a time of intense crisis, seizes and concentrates upon some mere trifle incidental to his immediate circumstances. The shipwrecked passenger rushes back to his cabin to search for a magazine he has been reading, the householder risks his life in smoke and flames to salvage a stuffed cockatoo, the orator nearly comes to grief in a speech of greatest issue because of an elusive likeness in one of his audience, or the sympathetic listener to a tale of woe is possessed with an intense desire to laugh at sight of the narrator's *toupet* awry!

So it was with David Hardy and Anita Lalonne confronting each other at the moment upon which depended their entire future. As the forester halted within a few feet of Anita, the murderous jealousy which an instant before had almost blinded him suddenly subsided,

leaving him oddly puzzling as to whether the rich, lustrous waves of her hair reminded him more of a crow's wing with the sun upon it, or of the deep places in Laughing Lake where the shadows merged into the blue. Hitherto he had always thought of her as the 'prettiest' girl he had ever known; but now, as she stood erect and motionless, a diminutive, dainty figure beneath the towering trees, her large, inscrutable eyes fixed upon him, he recognised in a dumb, bewildered way that she had undergone some change, too subtle for his comprehension, which, though he resented it, filled him with a passion of love and longing.

As for Anita, a mill-stream of grotesque fancies raced through her brain, as, half-fascinated, she gazed at the wet black curls matted upon David's forehead, vividly recalling what he, in jest, had written her of his resemblance to a buffalo. Then she had laughed gaily at the picture her lover thus conjured up of his tousled head, but now the low brow and

sinister expression evoked a feeling of repulsion, coupled with the fantastic wish that David had had his hair cut before he met Gavin Barrie. An impulse seized her to throw herself into his arms, to ask his forgiveness for what offence she knew not, and with small, deft hand to brush back the unkempt locks, as she had so often done in the early days of their engagement. Possibly, had she done so, the pressure of her warm body, the touch of lips and hands, might at once have cooled the aggrieved man's heated blood; but, standing there dusty and haggard from his long night's ride and the vehemence of his emotions, his eyes hard and staring, and the fingers of his right hand nursing his revolver, he looked so menacing and unlike himself that Anita, clinging to the red-brown dog, remained rooted to the spot, while her quivering lips strove to form the one word, 'Dave!'

Once, and again, Hardy essayed to speak, before, in a harsh voice that even to his own ears sounded strange, he succeeded in saying coldly, 'I wanted to give you a surprise. I see that I have!' Then, the evil genius of jealousy overmastering him, while the red tide of passion dyed his face, and the veins in his temples knotted themselves like cords, he grasped Anita by the arm, hurling at her the words, 'If you belong to this man, go to him, girl; but as my promised wife I demand to know what you are doing here—and with him!'

'Have a care!' shouted Gavin Barrie, as his dog, resentful of Hardy's rough manner and handling of Anita, began to growl and bare his teeth.

'Have a care yourself!' roared the infuriated forester, suddenly whipping out his revolver and covering Barrie.

'David! Are you mad?' cried Anita, flinging herself upon him with such violence that the revolver fell from his hand and lay buried, muzzle downwards, in the soft earth.

Quick as lightning Barrie stooped, and snatching up the weapon, fired it rapidly, shot after shot, before flinging it far into the bush. Then, with a swift movement, he placed himself between the forester and Anita, and, gripping him by the shoulder, said quietly, but with a note of authority in his voice, 'You've had a hard ride in the hot sun, Hardy. Better sit down here and rest.'

For an instant the forester hesitated, glaring into the gray eyes so coolly fixed on his own burning brown ones; then the lids fell sullenly, while over his face, from which the angry flame had faded, there spread the pallor of deadly fatigue. 'No,' came in strained, bitter accents from his white lips; 'I don't want to rest—not here. I'll go back;' and turning on his heel, he staggered towards his browsing horse.

Like one transfixed Anita Lalonne watched him, her great eyes wide with distress; then, fleet as a deer, she darted after him, calling piteously,

'Dave!—dear Dave! Come back! Don't be angry; it's all a mistake!' Then the small feet stumbled in the unaccustomed roughness of the way, and Anita fell heavily, striking her head against a protruding rock.

So still and white she lay that the forester involuntarily halted in his retreat, gripped by an icy fear. What if Annie were dead—if he had indirectly killed her, as, in his jealous fury, he had just meditated doing? With shaking legs he retraced his steps, but not before the Englishman had already reached the unconscious girl, and lifting her in his arms, carried her to the edge of the creek.

'Fetch me some water,' he said curtly to David Hardy, tossing his hat to him. 'Be quick,' he added, as the forester, filled with remorse and shame, came and knelt beside Anita. 'Then keep out of sight for a few moments. I don't think she is much hurt; but you've made a fool of yourself and frightened her badly.'

Then, apparently forgetful of David's existence, he began speaking soothing words to the girl in the tender language of their beloved France; while the red-brown dog, which had hovered about in doubt as to what part he was expected to play, now satisfied that his master was 'boss' of the situation, came wriggling up to his prostrate friend, and licked the white hand usually so lavish of caress.

'For Heaven's sake get away, "Bob"! 'ex-postulated Gavin in low, impatient tones; while, a short distance away, the wretched forester again felt impotent rage stir his heart, as the hated dog fawned upon his 'girl.' But the moist, warm touch of the animal's tongue roused the object of his attentions, and, with a little moan, Anita opened her eyes.

'Dave!' was her first word. 'Where is Dave?'

For the space of a second a spasm of pain and disappointment darkened Gavin Barrie's eyes and caused his sensitive mouth to twitch. Then, 'Here is David, Anita,' he said gently in English, beckoning to the forester. 'Speak to him, for he is very anxious lest you are hurt. And now, *petite*, he will take care of you while I go to the Grizzly for a wagon to fetch you both.—I'll take your horse, Hardy,' he went on casually, but giving the forester a look that went through and through him. 'Come, "Bob"! 'he called to his dog, and started through the bush.

With mingled gratitude and chagrin, David saw the Englishman stoop and pick up something; then, with a broken sob, he flung himself on his knees beside Anita.

'Oh Annie, Annie, may God and you forgive me, for I can never forgive myself!'

'Poor Dave! Poor Dave!' murmured Anita, raising her head from his cradling arm and putting up the cherries of her lips for him to gather, oh, so hungrily.

(Continued on page 257.)

## LINGULA, THE LITTLE TONGUE: A VOICE FROM THE ROCKS.

**T**HE history of the little shell known as Lingula is one of the most interesting recorded in the rocks. Lingula is appropriately named, for the word means 'a little tongue,' and the shell is shaped like a tongue. And one ventures to think that the name is specially significant from another point of view, for in its geological history Lingula can 'a tale unfold' of more than ordinary interest.

Though very little known, Lingula is not altogether uncommon in our seas. It is a representative, one of the few now remaining, of what was once the predominating group of shells, the arm-footed ones, as they are called. The shells are for the most part tethered to the bed of the ocean by a flexible stalk, and the limited amount of motion they possess is effected by the vibration of a series of arms. And there is perhaps no living creature more suggestive as to the past life of the globe. It is one of the few cases in which nature has been 'careful of the type' through long geological ages.

The comparative rarity of specimens of Lingula in collections, and the fact that few people know it, are due to its living in the deeper waters of the ocean, and being thus seldom washed ashore.

But humble though it is among the Mollusca of to-day, and small as is the part it plays in the great drama of life, Lingula has been of no little importance in the past. It is one of the most interesting of the many fossil forms known to geologists. In such vast numbers does it occur in the Cambrian rocks—almost the oldest of our fossiliferous strata—that it gives its name to certain beds in Wales, the Lingula Flags. And it is a more or less important genus through the geological ages up to the present day.

Lingula, the little tongue! The name is significant beyond the thought of those who named it. For it was the *shape* of the shell, and not the tale it could unfold, they had in mind. Lingula, a paradox in the evolution of life! An unchanging thing in the midst of ever-changing forms! A voice from the past! Perhaps a protest against a too rigid theory of evolution by natural selection!

Does Lingula stand alone as a solitary example of an organism which has remained stationary amid a changing and advancing world of life? Or is it to be taken as a suggestion of many others of which the imperfection of the record has deprived us of all trace? Or perhaps our ignorance of the deep sea conceals some ancient forms hitherto believed to be extinct. Further research in the rocks, and in the ocean, may possibly reveal other examples. We cannot, however, at present look with any confidence for another quite so striking as Lingula. It

stands alone as a present-day form going back almost unchanged to early Cambrian times. Yet there are other living forms of vast antiquity. Rhynchonella, like Lingula, an inhabitant of the deeper ocean to-day, goes back in time to the Silurian; while another, the lamp-shell, dates from the Devonian.

But Lingula might almost paraphrase the words of Tennyson's brook:

Species may come and species go,  
But I go on for ever.

For Lingula has seen the coming and going of many and varied forms of life. In Cambrian times it lived along with a straight shell of the highest group of the Mollusca, itself belonging to the lowest. It has seen this straight shell, which had got so much before it in the race of life, vary in form and give birth, through a series of shells of gradually increasing curvatures, to a perfectly coiled flat spiral. It has seen this spiral change by a series of increasing complications of structure into the familiar Ammonite of Mesozoic times. It has seen its straight-shelled companion of Cambrian times disappear as the Ammonite came in. It has seen the latter, as it were, uncoil itself through a strange series of intermediate forms into another straight shell in the Chalk. And it has seen the whole race disappear.

Lingula has seen the Trilobite come—in Cambrian times—and go—in Carboniferous. It was present when the first of the piscine race came into a fishless Silurian world. The great fish-lizard swam over it, and perhaps ate it, while its long-necked reptilian fellow may also have been able to reach it as it grew at the bottom of the ocean. Lingula has seen the reptilian dominion of the air yield to the avian, heralded by that strange bird with the feathered reptilian tail, and with claws on its wings, lithographed on certain fine-grained slates at Solenhofen. And Lingula was a spectator of the invasion of the sea by those strange marine mammals, the whales, the seals, and the manatees.

Is Lingula, then, to be taken merely as a case of an organism remaining unchanged through countless ages while all the world of life around was changing and progressing? Did it *never vary*, and thus present us with a strange exception to a supposed general law, 'Multiply, vary, let the strongest live and the weakest die'? From this law new species are believed to arise. And it has always appeared to the writer that progress—either upwards or downwards—was an essential part of Darwinism, and that there could be no such thing as specific standing still. There is individual variation in all species, and

natural selection is always at work. The more favourable variations *must* survive, and the rest be weeded out. Gradually a new species *must* be formed. It is the *only* way, according to Darwin, in which new species can be formed. And granted the premises, variation, and the struggle for existence, the new species is inevitable. If you deny this, you deny the power of natural selection to evolve new species at all. It would almost seem as if *Lingula*—the little tongue—were questioning Darwinism.

Has any one grasped the full significance of the occurrence of *Lingula* in the lower part of the Cambrian system, and its persistence almost unchanged to the present time? We find it to-day in our seas, living in tubes in the sand. The upper parts of these are flattened for the body, while the lower part contains the stalk. 'At the least sign of danger the stalk is contracted violently, and the body is withdrawn to the bottom of the upper portion of the tube. The rapid retreat of the animal is followed by the collapse of the sand at the mouth of the tube, and all trace of the presence of the *Lingula* is lost. . . . When once settled down it has little to fear from the attacks of other animals. The size of its shell relative to its body would deter most animals from regarding it as a desirable article of food, and, as far as is known at present, it suffers but little from internal parasites.'

We quote from the *Cambridge Natural History*. And we can now understand why *Lingula* had little chance either of extinction or evolution. It was too well protected. Clever *Lingula*, thus to have solved the problem of a safe and ready retreat from its larger enemies! To be, in the first place, an undesirable article of diet! How much wiser it has been than the delectable oyster, or even the humble periwinkle! And then to have acquired so lavish a share of the fairies' fern-seed prescription for invisibility! To be able to vanish into thin air, so to speak, with a celerity and completeness which Mr Maskelyne might have imitated, but could not have surpassed! And then to keep clear of parasites—that is, of disease! An example even for the human race. *Lingula* has attained that for which our medical science, and our antiseptic and aseptic treatment, are striving with so small a modicum of success. Would that the little tongue could indeed speak and tell its secret! Is it a bit of the pristine vigour of a primal world or the relic of a golden age of its class?

But we can now understand why, although *Lingula* *may* have varied as freely as any other species, it has never altered. For what variation could possibly be more favourably constituted than the original type? Not good to eat, able to disappear when threatened with danger, free from parasites! And then *Lingula* has lacked that 'vaulting ambition' which has led other forms to leap to something higher, and fall on the side of extinction. But surely, we say, *Lingula* is

a good example of the more primitive forms of life coming first. Surely it is one of the simplest and least specialised of its class. Had we been told so, we should have accepted it without question. But we consult again our trusty *Cambridge Natural History*, and read: 'The extreme specialisation of the muscles in many of the earliest genera (for example, *Lingula*) is remarkable, and points to a long, but so far undiscovered, ancestry in pre-Cambrian times.'

But if *Lingula* did not vary then, other species need not have done so; that is, we are not bound to believe that species vary universally. In fact, *all* may have been specifically constant. Of course, all organisms vary, but we use the word in the sense of *continuous* variations which may lead to new species. *Lingula* did not vary in this way, yet it must have varied. Its variations must, however, have only been minute departures from the type, and not *continuously* increasing ones such as are required to make new forms. Perhaps many species vary only in this way. We do not *know* that *any* species varies in any other way. It would almost appear that *Lingula* itself is a fatal objection to Darwinism. For Darwinism postulates a universal law, 'Multiply, vary, let the strongest live and the weakest die.' Out of this troubled sea of natural forces new species must issue, as Venus of old from the ocean. If *Lingula* had varied, then some of its variations would have been better fitted to survive, and should have given rise to new species. But if it did not, then the law is not universal—in fact, not a law.

But *Lingula* has perhaps lacked ambition. It has said:

'Verily,  
I swear, 'tis better to be lowly born,  
And range with humble livers in content,  
Than to be perk'd up in a glistening grief  
And wear a golden sorrow.'

Its companion in Cambrian seas aspired to become the coiled Ammonite, the molluscan king of the Mesozoic ocean. Even then unsatisfied, it uncoiled itself into various fantastic forms, and finally straightened itself into the rod-like form again. But only to find itself 'perked up' in the 'glistening grief' of extinction, and wearing the 'golden sorrow' of *Troja fuit*. And *Lingula*, the 'humble liver,' has ranged on content to our day!

But, again, it must have taken a *lot of variation* to evolve a *Lingula* from whatever extremely simple form it originated in. How, then, can we account for the comparatively sudden cessation of variation in our little shell as soon as it became generically *Lingula*? Natural selection, said Darwin, 'is always intently watching each slight accidental alteration,' and 'will pick out with unerring skill each improvement.' It has, then, been 'watching' *Lingula* for—shall we be sober and say one hundred million, or,

radium-inspired, suggest thousands of millions?—years in vain. If there are no improvements, then the 'unerring skill' goes for nothing.

And lack of variability has been assigned as a plausible explanation of extinction in many fossil forms. Species which cease to vary—but why should they ever cease to vary?—cannot adapt themselves, specifically, to changing conditions. So they die out. Thus we are, as usual, on the horns of a dilemma. Either

Lingula varied or it did not. In the first case, why did it not branch out into new forms? In the second case, why did it not become extinct? So the Lingula becomes a Sphinx, propounding questions we cannot answer.

If there are 'tongues in trees,' here is one also in the rocks. And if Shakespeare had turned his attention in that direction he might have given us an excellent *sermon in stone* from the text of Lingula.

## THE MYSTERIOUS MIASMA.

### CHAPTER III.

THE visitation of Edge's sixth week took a heavier toll than any of its predecessors. But Edge was preparing to grapple with the cause. He had been steadily gathering his data, and he was now as steadily arriving at his conclusions. Leila's suffering spurred him on. In her company daily, sharing her home life, constantly exchanging thoughts with her, observant of her gracious womanly qualities, he was unconsciously attracted by her personality, all the more perhaps because the curving beauty of her face was the index of a firm, yet gentle, character.

'You may discharge me, Mr Kennerley.'

'Have you finished your investigation?' inquired the manager, expectant, and eager to hear what the scientist had to say.

'In the laboratory. That completes the second phase. The third will be final. My antagonist is invisible, and, to defeat him, I must be free. And so, Mr Kennerley, I suggest that you should discharge me.'

'I accept the suggestion,' replied the manager, with a smile; 'and yet, if it means an end to our intercourse, I shall be very sorry.'

'It does not mean that,' Edge assured him. 'I shall want your help. Let me explain. The first phase was to mix with the workpeople, to gather fresh facts, and to verify them. There has been no collusion between any of the workpeople and the secret and crafty foe who has engineered these subtle and particularly cruel attacks. We may congratulate ourselves on that score. And yet, Mr Kennerley, he has not acted alone. Others have been associated with him, and are associated with him now. But they are outsiders.'

'Therefore easier to deal with,' observed the manager.

'If we can trap them,' added Edge. 'I have made a plan of the works, Mr Kennerley;' and he unrolled a sheet of paper, spread it on the table, and weighted it at the four corners. 'The red shading indicates the courses taken and the areas covered by the four visitations since I came; the blue shading, the other visitations preceding my arrival, with their courses and areas, ascertained approximately by

conversations with the workpeople. Each visitation is dated. You will notice, too, that I have sketched a compass in the centre of the plan true to the works' magnetic bearings. Beginning exactly south, I have extended the points of the compass by dotted lines westward as far as west-south-west, and eastward as far as east-south-east—twelve points in all, not reckoning the point of departure.'

'Yes,' responded the manager, poring over the plan.

'And all the visitations, you will observe,' Edge went on, 'fall within the angle of the outward lines, east-south-east and west-south-west. That is, quite two-thirds of the dunes in which the works are situated have been immune from the attacks.'

'That is so,' said the manager. 'The people working in the northern portion of the dunes have not suffered at all.'

'Now, Mr Kennerley, during the four attacks of which I have had personal cognisance the wind has been southerly, varying a point or two with each attack, but always southerly; and during the last, and worst, the wind was blowing from south-west by south, a gentle wind, not too strong, but sufficient to carry—the miasma, shall we call it?—steadily and evenly through all the hollows open to that course. The other attacks preceding these four have always been accompanied by a southerly wind. And the people have always suffered the most when the wind has been blowing gently from south-west by south, or as near as may be to that particular point. I conclude, therefore, that we shall find the source of the trouble there'—and Edge placed his forefinger over a spot in the plan outside the works—'there,' he repeated, 'or thereabout.'

'But'—and the manager stopped, reflectively, with the objection still in his mind.

'Yes?' queried Edge.

'That spot is like all others—sand, held together more or less loosely by the rough reeds that cover it. Is it your intention to dig there?'

'Maybe. I cannot say yet. But, depend upon it, that is where the stuff is released.'

'Have you analysed it?'

'Carefully. It cannot be strictly called miasma. It is a deleterious mixture of four different gases passed on its release through a layer of charcoal.'

'Charcoal?'

'I am sure of it—as sure as if I had seen it—and a very considerable layer. Charcoal is not a natural deposit in these dunes.'

'I should say not,' returned the manager, smiling and yet surprised; 'nor anywhere else that I am aware of.'

'No. It was placed there, built into a layer for the mixture to pass through. And that is the reason, Mr Kennerley, why the mixture is odourless and colourless, or, as you said when first we spoke about it, more like a radiation than a miasma. The charcoal absorbed both the colour and the odour. But you have narrowly escaped a catastrophe far more terrible than the sicknesses and fatalities of a proportion of your workpeople.'

'How?'

'By your workpeople's acceptance of the restrictions imposed upon them—possibly by the fact that most of them are women. A lighted match thrown down by a careless smoker, a spark even, would have changed the radiation into an explosive that would have shattered all the works, and left very few of you, if any, to tell the tale.'

The manager, holding his breath, said, 'That would have been a frightful calamity.'

'It would, indeed; and that was the intention—to blow up the works. So far, you have averted that. And now the possibility of it must be removed.'

'If I can help you in any way'—said the manager.

Edge interposed. 'Did the clerk who took Miss Fairley's place satisfy you? And is she still available?'

'Yes. She's still available. But I prefer Miss Fairley. If, however'—

Again Edge interposed. 'You could help me by freeing Miss Fairley.'

'For service in the laboratory?'

'No. You have forgotten. I have been discharged.'

'So you have. But I thought, seeing that Miss Fairley is a B.Sc., and qualified for laboratory work'—

'I was not aware of it. Why isn't she in the laboratory?'

'Because our special need when she joined us was not there, but in the office. She was willing to take up any kind of work that she could do.'

'Can you spare her?'

'I must.'

(Continued on page 254.)

## CYPRUS: A NEGLECTED ISLAND.

By Captain K. C. FERGUSON.

IN Cyprus in the year 1196 the monk Neophytus wrote these gloomy words: 'A cloud veils the sun, and a mist mountains and hills, and these for a while shut out the warmth and bright ray of the sun, and us too, for now twelve years, a cloud and mist, of successive calamities which have befallen our country, wrap round. For Jerusalem having fallen under the rule of the godless Saladin, and Cyprus under that of Isaac Comnenus, fights thenceforth and wars, tumult and disturbance, plunder and dread events covered the land.' . . .

Cyprus was to drink the bitter cup to the dregs; her fortunes were to wax and wane; but now, after many centuries, a bright future has dawned for the island. Let us hope it may dawn, too, for the afflicted lands that surround it. For well-nigh two thousand years the bountiful gifts of nature have been squandered, crushed, or neglected by the stupidity, rapacity, and vice of man. War, famine, and pestilence have stalked these rich lands from end to end. Nowhere in the world have the gifts of God been more shamefully abused. Under honest and intelligent government Egypt has emerged from centuries of evil administration and neglect. Cyprus has recovered much of her former prosperity. But what of the great ex-

panses of Asia Minor, of Syria, Palestine, and Mesopotamia, which have feasted for hundreds of years under the heel of the Turk? With them I am not directly concerned, except in so far as they have a bearing on the condition of Cyprus, of which it is here proposed to give an account.

To some who may chance to read these lines Cyprus will seem of little account in our vast Empire, and at the present moment the tremendous events of the war absorb men's minds in more important spheres. Yet here is a large island lying over against one of the most vital parts of our Empire system—namely, the Suez Canal. Who is to say it will be of no military value in the future? For a brief space it came sharply into the limelight when in 1915 our Government offered it *en bloc* to Greece as the price of her aid—mere backsheesh, forsooth!—which set the local Greek element agog with excitement, and disgusted the British. The calamity was averted.

Let us look into its history. From the most remote past a tradition has come down of an island of great beauty and fertility, a land of vines and olives, of corn and figs and oranges, of rich plains and majestic mountains, of forests, and of mines. It is from Cyprus that copper takes its name. Greek mythology honoured it; for

did not Aphrodite arise here from the sea-foam, and was not Eros, her son, born here, born at that enchanting spot, Dieu d'Amour, where now the ruins of St Hilarion stand forth in the sky—a fairy castle of our dreams? So favoured an island could but be the prize of conquering peoples of old; and what was true then is true now. Egyptians, Phœnicians, Greeks, Romans, Crusaders, Venetians, Genoese, Turks, and British have in turn possessed it in whole or in part. Its history has been eventful.

The Egyptians have left traces. The Phœnicians mined for copper. Ancient Greece has left remains. The Romans ruled it for many centuries. The city of Salamis, of Grecian origin, was a flourishing place in the days of St Paul. He and Barnabas visited the island, and Barnabas came to be martyred near Salamis. It was then in Roman hands; and when, some centuries later, the Roman Empire, in its decay, split into Eastern and Western portions, Cyprus became a proconsulship of Byzantium. As such it remained, despite a series of Arab raids in which the famous Haroun al Raschid figured, until the period of the Crusades. Lax administration permitted of an adventurer connected with the ruling house at Constantinople making himself master of the island in 1184, under the self-styled title of Emperor. His name was Isaac Comnenus. The records we have agree in branding him as a vicious and cruel tyrant, under whom the people groaned. Now, when he had been a few years on the throne it happened that Richard I. of England set out on the third Crusade. It was in the year 1191. With him, though in a separate vessel, came his fiancée, Anne Berengaria of Navarre, and his sister Johanna, Dowager Queen of Sicily, while a fleet of ships bore his army to Palestine. A storm overtook them in the vicinity of Rhodes, and the ships were scattered. Some became wrecks on the west coast of Cyprus, and the survivors were ill-used by the miscreant Isaac. The vessel containing Anne and the other ladies made the port of Limassol, storm bound. Here the conduct of the Emperor Isaac caused them to be in much fear and trepidation, when other ships, and happily Richard himself, came opportunely to their relief. Angered at the behaviour of Isaac, Richard sent a knight ashore demanding explanations and apologies; but, as he obtained no satisfaction, his hot blood surged up in passion. He forced a landing, and drove Isaac helter-skelter from the place. Then the anxieties of the past few days evidently caused him to desire marriage forthwith, and a week later, on 12th May 1191, Anne Berengaria became Queen of England, in a chapel that is pointed out to this day in Limassol. 'The King,' says an old chronicler, 'was glorious on this happy occasion, and cheerful to all, and showed himself very jocose and affable.' Isaac Comnenus fled to the Castle of Kantara, where later he was cap-

tured, and sent in chains to a fortress of the Hospitallers in Syria, there to end his days in shame. Richard appointed lieutenants in Cyprus, and, leaving a garrison, proceeded with but little delay to the Holy Land. It was not long before he found himself hampered by lack of money and of men; so, entering into a bargain with the Knights Templars, he sold his new possession outright, and withdrew his garrison. The rule of the Templars was brief. They were unable to cope with the people, and finding it impossible to control them with the forces at their disposal, they entered into fresh negotiations with Richard, whereby the island again passed into his possession, and thence, as a sop for the loss of his kingdom of Jerusalem, to Count Guy de Lusignan. This marked a new era for Cyprus. Guy was a man of poor ability, but he held tenaciously to the country, and through his heirs and successors established the Lusignan dynasty, which was to rule the land for three hundred years in the heyday of its medieval prosperity.

During this period circumstances, though elsewhere disastrous to Christian power in the Levant, favoured the prosperity of Cyprus. With the fall of Acre, the last Christian stronghold in the Holy Land was swept away, and many of the survivors fled in a night to Famagosta, which lies on the eastern shore of Cyprus, over against the Syrian coast. Cyprus now became the outpost and emporium of Christendom in the Levant; while north of it, in Rhodes, the Knights Templars for many years upheld their military prestige, successfully combating the growing Moslem power, and checking piracy, which was then rampant on the seas. In the Lusignan period Cyprus became famous throughout Europe for the riches and luxury of its inhabitants. Fine Gothic buildings sprang up. Famagosta became a city of churches. Nicosia, the capital, vied with it in architectural display; and the Premonstratensian monastery of Bella Païse, a place of rare beauty, remains as the most notable Gothic ruin in the Levant. Medieval castles of an earlier date crowned the summits of St Hilarion, Buffavento, and Kantara. Peace and prosperity blessed the land, too soon, alas! to be dispelled. Early in the fifteenth century significant events were shaping themselves. The Turks in Asia Minor waxed exceedingly as a military power, ere long to spread locust-like over all the land, and to pour far out beyond its borders.

The Lusignan dynasty at length died out. King Jacques III., an infant of eleven months, died in 1474. His mother, Katherine Cornaro, a noble lady of Venice, reigned for a few years, until the Republic, desiring Cyprus as a base, replaced her by officers of its own. Katherine retired to a villa in Italy, and Venice annexed the island in 1489. Venice was ere long to decline. The trade that made her great, pouring from east to west by caravan routes and by the

Red Sea, was being sapped by the adventurous voyages of the Portuguese. When Vasco da Gama established a trade-route round the Cape, he sounded the death-knell of Venice. The Mediterranean ports gradually decayed. But when first the Venetians came to govern Cyprus they set about making it a fortress and naval base of great strength, and less energetically commenced the fortifications of the capital, Nicosia, which lies in the bosom of the central plain some thirty miles inland. At Famagosta walls of immense strength were built, surrounded by a cavernous moat. Harbour works and a naval and military arsenal completed the equipment of the fortress, which was doubtless looked upon as the key to the possession of the island. We shall see soon how the lock was picked.

The Turks had now become a great power. Rhodes had fallen before them in 1423, after a gallant and protracted defence under its Grand-Master Philippe Villiers de l'Isle Adam, to whom, in honour of the defence, Henry VIII. presented nineteen bronze cannon, one of which was, curiously enough, recovered from Famagosta harbour some years ago, it having been located in the mud by a pearl-diver. It was brought to the surface for its value as metal; whereupon its identity was discovered. How it came there is a mystery. Now it stands in the grounds of Government House at Nicosia. But, to revert. The power of the Turks grew strong and fierce. Constantinople fell in 1453, and with it the rotten fabric of the Byzantine Empire crumbled to dust. Cyprus could not long evade the ambition of the Moslems. Venice having possessed the island for some eighty years, the Sultan Selim conceived the idea of wresting it from the Republic by force of arms. It is said that he desired it in order to have the means to endow a mosque in Constantinople. Be that as it may, the Turks determined upon the capture of the island. Relations with Venice, hitherto of a somewhat friendly character, having been severed under one pretext or another, a large force under the General Lala Mustafa made good its landing on the southern shores of the island. This was in the summer of 1570. Dismay struck into the hearts of the Venetians, and their preliminary operations were characterised by vacillation and incapacity, anon to be redeemed in military virtue by their spirited defence of Nicosia, to which Mustafa speedily laid siege. Its fortifications were incomplete and its garrison inadequate. The story of the siege has been vividly related by an eye-witness, Fra Angelo Calepio, superior of the Dominican Convent. Suffice it to say that, after a gallant defence of six weeks, the city was stormed and given over to the horrors of a sack. The victorious Mustafa now marched east to Famagosta, which was weakly held by a garrison of some four thousand men. To it he laid siege, erecting

vast earthworks against the south wall of the fortress. But the moat, the massive walls, and the courage of the defenders baffled him. Once, after terrific efforts, the Turks surmounted the walls and planted the Osmanli standard upon them, only to be hurled back by a rally of the defenders. Forty thousand Turks died of wounds and disease, and for twelve months the place held its own, obtaining some relief from time to time from the sea. At length its commander, Bragadino, was forced to surrender through starvation, having previously obtained honourable terms from Mustafa. The latter, up to this point, had behaved well, according to his lights. Now, however, inflamed at the loss of so many men, and at his failure to take the town by storm, and enraged too, it is supposed, by the proud bearing of Bragadino, who rode out of Famagosta under a red umbrella, surrounded by his principal officers, Mustafa cast off the cloak. Upon a pretext that Bragadino had treacherously connived at the death of certain prisoners, he caused his officers to be bound and slain upon the spot. He himself, having been threatened with decapitation, was mutilated—his nose and ears were cut off; and in this pitiable state he was forced to labour on the walls. Later he was hoisted in a chair at the yard-arm of a ship, and held up to the ridicule of the ruffians of the place. The crowning brutality came when Mustafa caused him to be publicly flayed alive. The bestiality of this deed would scarcely be credited were it not well authenticated. The brave man bore his tortures heroically, and his spirit triumphed in death. Not even here did the fiendish anger of Mustafa cease. The skin was stuffed with straw and paraded through the streets under the identical red umbrella below which he had evacuated the town.

Here was a deed of shame almost without parallel.

The island was now conquered, and a period of three hundred years of Turkish rule ensued. Of the Turks be it known that the best they have done for their subject peoples, except on rare occasions, has been to neglect them. There have been enlightened Pashas who have made some effort to improve local conditions, yet it is but too well known that Turkish rule is typified by a general decay in the moral and material welfare of the countries it has governed. Cyprus was reduced to a skeleton of its former self. Not that the people were systematically ill-treated, but their energies were progressively sapped by a retrograde and moribund administration. Agriculture declined, the population fell away by scores of thousands, and timber, so valuable to the climate and rainfall of a district, was wastefully felled. Goats completed the destruction by eating up the new growth. The unrestricted grazing of these animals has caused immense destruction in Spain and Greece and

elsewhere. Locusts, too, ravaged the land. It is terrible to contemplate these wasted centuries when God's gifts were allowed to rot or be destroyed before men's eyes for the lack of intelligence and will to conserve them. Be the fate of Cyprus what it may, I, for one, hope that the Turk will never again be its master. He has his virtues, but as an administrator one thinks of the passage in 'Simon the Cellarer:—' 'What! Marry old Marjorie? No, no, no!'

Needless to say, the buildings of Nicosia and Famagosta, many of them fine specimens of Byzantine and Gothic architecture, suffered severely in the sieges, particularly those of Famagosta. On the large Gothic church of St Sophia the splintered pock-marks of Turkish cannon-balls may be seen to-day. What remained of the crowded buildings after the siege was further ruined by earthquake shocks at a subsequent date; and finally the building contractors of Port Said and Alexandria helped themselves freely to the masonry. So now the visitor to this once elegant medieval city sees the ruins of a score of old structures, among which the fungus growth of the Turkish settlement has spread. The Turk is too lazy to pull down or to repair. The fighting over, buildings were left to decay, except that the walls of the town were patched up. The principal churches of Nicosia and Famagosta, having been selected for mosques, were partially spared from the general ruin. They exhibit a grotesque mixture of Arabesque repair, superimposed on a Gothic base. The minaret replaces the steeple, and, to meet Mohammedan orientation, the arrangement of carpets, lecterns, and pulpits is slewed round at an angle to the lie of the building (this in Nicosia), so as to point to Mecca. The massive walls of Famagosta remain practically intact, but inside the atmosphere of desolation that pervades the place is depressing. The visitor turns away. 'Did I come all this way to see a rubbish-heap?' he exclaims. Truly the wreck is complete. Outside the walls there spreads a bald plain, once amply wooded and dotted with gardens, as many abandoned walls testify. In Nicosia, at the time of the British occupation, there was not a tree. Men journeyed at the risk of their lives, and settlers outside the walls lived in daily dread of robbery and violence. The evil rule of the Turk manifested itself here as elsewhere.

But once more the kaleidoscope of political events was to bring a change that augured better days for the desolated island. British apprehension at Russian advances in the Caucasus caused our Government, in the seventies, to negotiate with the Sublime Porte for the occupation of Cyprus as an offset against the Russian occupation of Kars and Batoum. In 1878 Lord Wolseley, with other high officials of both nations and a considerable force of British

troops, landed on the island, and the *Pax Britannica* was to bless the land. Our administration was somewhat hampered by the fact that Cyprus remained a Turkish possession. The scanty revenue of the island was burdened by the payment of an annual tribute to Constantinople, and the term of our occupation was vague. Such conditions did not favour the maximum benefit to the island. Nevertheless, clean-handed British officials set about improvements in the internal economy of the country. The Council, presided over by a High Commissioner, and comprising British, Turkish, and Cypriote members, worked as well as its peculiar constitution would allow. Between the Turk and the Cypriote there is no love lost, and, truth to tell, the former is in many ways the more acceptable. He has distinct manly virtues, and when he is guided by methods more enlightened than his own, the evil traits in his character cannot assert themselves so lamentably. In a few years there came about a state of things unknown to the existing generation of Cypriotes. Good roads replaced the roughest mule-tracks. A well-organised police force assisted in maintaining law and order. Justice was administered. Agriculture was encouraged, and forests were conserved. The gratitude of the natives is on record. But to-day a new generation is to the fore, and the old evils are forgotten. Loyalty to Britain is not always found. When the first ambiguous account of the battle of Jutland came through, a noisy faction in Limassol held champagne lunches in honour of the British 'defeat'! Tino had a considerable following.

Now, since the declaration of war with Turkey, Cyprus has definitely become a British possession; but, even so, the man in the street cannot yet tell what its fate may be in the coming peace settlement. The writer fails to see any good reason for handing it over to a foreign Power. The island is self-supporting. The ruinous tribute to Turkey has ceased, and with the fuller development of its natural resources its revenue will be greatly increased. In other words, it can run itself financially. No advantage would accrue to the natives were it handed over to Italy, France, or Greece, as some suppose it may be. Further, as has been said, it lies over against the mouth of the Suez Canal. Do we desire a foreign fortified base in this position? Britain has ruled the country for forty years, and the people know our ways. Some of them have told me that they dread the British may evacuate it.

Now, a word as to the people, the country, and the climate. From what has been said, it is obvious that the people must be of very mixed origin. Select a hundred villagers from different parts of the island, and you will find many different types. There is the swarthy, handsome man, who might be from Italy, from Greece, or the Balkans, or, just vaguely, a Levantine.

There are people of Syrian parentage. There are Jews and Armenians. Negroes are not infrequently met with; and every now and then one is startled by a blue-eyed, fair-skinned, flaxen-haired type, whose ancestors more than likely came with the Crusaders. But the typical Cypriote villager seems to be of the swarthy kind mentioned first. There are many thousands of Turks, who for the most part live together in communities separate from the Christians. The dress of the peasants is extremely picturesque, for the Cypriote delights in gay colours. Fashions vary, but the baggy pantaloons, with its curious droop behind, is everywhere affected. A white shirt, a brightly embroidered lancer jacket, white pantaloons, and gay stockings, with a garlanded fez on the head, form the typical dress. A more sober habit consists of the same elements, but the jacket is of black embroidered velvet, and the pantaloons and stockings are of black material, while a black or white straw hat takes the place of the fez. These are holiday clothes. For everyday work, a simple white shirt, indigo-dyed pantaloons, and roughly made jack-boots are worn, the last-named to protect the wearer from thorns, thistles, and snake-bites. The head-dress may be the fez or any shape of straw wide-awake. The women's clothes are not nearly so ornate as the men's. A simple cotton print bodice and skirt of nondescript design is affected, while the head is covered with a neatly tied handkerchief. The women are not usually pretty, while the men are for the most part distinctly handsome. Christians of the Orthodox Greek Church outnumber the Moslems by more than four to one; and the disproportion will probably increase, for it is said that where Christian and Moslem are in free competition side by side, without fear or favour, the latter goes to the wall. At the time of the British occupation the population was approximately 180,000. The census of 1911 gives it as 273,964. These figures speak volumes in themselves. The people are frugal and industrious, keen on a bargain, and notoriously jealous of one another. They are law-abiding, but hot-blood crimes and the use of the knife are not infrequent. Strong drink is often the immediate cause.

As to the terrain, the island consists of a northern range running the whole length of the coast from east to west, the mountains rising sharply from sea and plain, and presenting a striking appearance, though they reach only some three thousand feet in height. In the south-west a great mass of mountainous country culminates in the summit of Mount Olympus, six thousand four hundred feet above sea-level. From this, on a favourable day, a most impressive and vast panorama is spread below the feet of the observer. Between these two mountain systems there lies the treeless central plain, parched and brown in summer, but covered in

the most part in spring with fields of wheat, barley, and flax. The absence of trees and the dryness of the place are its striking features, and it stretches in one bare expanse from east to west. There are, however, some picturesque villages, about which are trees and gardens; and Nicosia, the capital, lies in the centre of it. The Olympus range is covered with fine timber, and the foothills on its southern slopes provide a large area for vine cultivation. The low ground about the hills is everywhere thickly studded with carob and olive trees. The carob provides the locust bean, of which large quantities are produced in Cyprus. The island is extraordinarily fertile, and many fruits grow to perfection. A bare list of these will suffice—namely, grapes, oranges, figs, olives, cherries, lemons, melons, pomegranates, apricots, nectarines, peaches, and caishas. Pears, apples, and strawberries are also produced. There may be some I have overlooked. Water is the crying need. Without it the land is barren; with it the very stones will sprout green. Rain falls heavily at intervals between October and March, with showers on till May. Then there set in five or six months of absolute drought and severe heat. Yet the water collects not many feet below the surface, and here lies the natural reservoir of the land. Almost anywhere one may sink a well and find water from ten to thirty feet below the surface; but to raise it requires labour, or the expenditure of capital in pumps. The petty cultivator hauls it up by hand; the farmer raises it by a windlass and an endless chain of buckets worked by mule or donkey. But a better system is provided by the Canadian air-motor—simply a tall metal windmill—which actuates a pump connected with the well below, from which, in a moderate breeze, a steady stream of water, as thick as one's wrist, pours into a tank—a delightful spectacle of ease and power in a parched land. More advanced farmers employ powerful steam-pumps. The Government has busied itself with irrigation-works, and large reservoirs have been built. These, however, are of doubtful success. They possess the disadvantage of all standing water in these parts—namely, they breed enormous numbers of mosquitoes, and consequently have to be run dry by a certain date. Also, the loss by evaporation is very great. The natural reservoir lies below the surface. The agricultural increase of the island (and there is much waste land) seems to depend on the expansion of the pumping system, though at some future date the necessity for this may be reduced, as the country becomes adequately clothed with timber. In the Nile Delta the Fellaheen say that the British have brought rain; and there is no doubt that a noticeable change of climate has been brought about by irrigation and the increased area of land brought under cultivation. Similar results may be looked for

in Cyprus. Afforestation has been sadly hampered by lack of funds, but Mr Winston Churchill was able to do the island a good turn in this respect some few years ago, obtaining a small annual grant for the purpose from the home Government. He came and saw. Much has yet to be done, and the projects of the British officials do not always meet with support from the other elements in the Council. The evils of pernicious bankruptcy laws have lately engaged their attention, but in a country where usury is a fertile source of income, stubborn opposition is to be expected. Infinite patience and tact are demanded of the British administrator, and the policy of *festina lente* is the only one to be relied upon.

Cyprus is essentially an agricultural island, yet it possesses deposits of copper, which have

been worked from very ancient times. The Romans appear to have ceased mining owing to difficulty in obtaining fuel. There is plenty of copper (heavily mixed with sulphur), and an American company works it profitably. The existence of asbestos in the Olympus range was known to the ancients, but commercial use has been made of it only recently. The staple is short, and a demand for this was not formerly existent. The pioneer company, an Austrian one, was working at a handsome profit prior to the war. Now the mines are carried on under Government control.

So I may conclude an account of this interesting island, with its sunny climate and fruitful soil—a place more deserving of a visit than is generally known; but until the war is over, martial law sets its seal upon it.

## THE NATION'S WORD.

By JOHN S. MARGERISON, Author of *Action! The Sure Shield, Turret and Torpedo, &c.*

LIEUTENANT WALTER CARSTAIRS puckered his brow as he slowly turned the head of his periscope so that he could look around the horizon. Then, slewing suddenly upon his tiny stool, he beckoned to Sublieutenant Jevons, who, with himself, formed the staff of officers belonging to His Britannic Majesty's Submarine L73.

'I say, Jevons,' drawled the lieutenant, 'just shove your eye in here and tell me what you make of the spectacle.'

The sub obeyed his chief's orders. As his eye took in the scene, he whistled softly.

'Phew!' he muttered, as he relinquished the periscope eyepiece to his commanding officer. 'Fritz looks as though he'd come out for "*Der Tag*" at last. Thirty-odd battleships, three cruiser squadrons, and enough destroyers to police the Seven Seas, not to mention half-a-score of transports.'

'Yes,' agreed Carstairs slowly. 'It looks like "*The Day*" at last; only, our own fleet isn't on the spot to ensure its dawning. And that's a pity, too, for I believe our lads are simply clamouring for a decent scrap. Ah, well, as they can't be here in person, I suppose we'd better act as substitutes—proxies, if you like—for them, and show the Boche he isn't quite the lord of creation yet. All clear forward, Jevons?'

The sub strode forward to where the rear doors of the twin torpedo-tubes gleamed brassily in the electric light. He bent, made a swift inspection, and then threw up his head with a prideful lift.

'All clear, sir,' he reported. 'Both tubes loaded, and a pair of spare torpedoes ready for use.'

'That's good,' returned Carstairs. 'Now we'll sit on the bottom and have a confab.'

L73 canted her tail upwards and sought the soft mud on the bed of the Baltic. When she was finally at rest the lieutenant turned from the controls to the men, who, each at his particular post, eagerly awaited the news the feeling in their bones had signalled to their intuitive instinct. As Carstairs looked upon the thirty faces he experienced that uplift of soul which is the prerogative only of the officer whose men love and trust him—who can, if he so desires, lead them blindly and willingly over the edge of world's crust into the nethermost Hades.

'Lads,' said the lieutenant simply, 'the German Fleet are out above us, or nearly so. Obviously, as this is the Baltic and not the North Sea, they're after coming to grips with the Russians, whose fleet is not only hopelessly inferior in numbers to Fritz, but whose crews are in a rotten state, without officers and without discipline. Unless something unforeseen happens, the Boche is going to have a good time, and is going to claim that he is still boss of the ocean. Now it's up to us to show him what a bloomer he's made—and we're going to do it. Lads, for the first time in your lives you're going to go into what you've been seeking a long time—a real scrap against long odds.'

The steel tunnel of L73's interior resounded with a deep-chested cheer as the thirty gave tongue in enthusiasm, and not even Carstairs's upflung hand could quell the noise for a full minute.

'And now that you've got that off your chest,' he observed at length, 'get up all our spare torpedoes, put war-heads on them, and stand by to fight like fiends for the love of the thing, and for the honour of the Old Country.'

Immediately there was bustle around the foremost hatch leading to the spare torpedo-room.

Carstairs caught with his eye those of his three petty officers, who came for orders at his nod. 'While they're getting the tin-fish ready,' ordered the lieutenant, 'we'll take the old hooker up to see what is to be seen. Stand by the tanks and the tubes.' He glued his eye to the periscope, though the head of this useful apparatus was still under water. 'Blow all main ballast-tanks,' he commanded. 'Rise to thirty feet.'

The sound of escaping compressed air, as the salt water was blown out of the ballast-tanks, mingled with the clanking of the chain torpedo-tackles, and through it all the fingers of the depth-gauges flickered and rose from fathom to fathom till the desired depth was attained. Then the upward motion stopped, and the little vessel went ahead at slow speed, her periscope-tip just clear of the surface, a slight lop thereon hiding what little trail it made.

'We're in luck!' exclaimed Carstairs. 'We've risen right between the two battleship lines. Stand by the starboard tube; fire when I drop my hand.'

With his eye still glued to that periscope, Lieutenant Walter Carstairs deftly conned the submarine till her bows were bearing direct upon the *Furst Ernst*, the flagship of the enemy's Second Division. All-unconscious of the threatening danger, the great ship steamed on; while astern, at exact intervals, a dozen of her sisters looked to her for order and behest.

Suddenly, even as Carstairs looked for the last second before pronouncing the fatal word 'Fire!' the *Furst Ernst* whipped a rainbow of coloured bunting to her foremasthead, and, to emphasise the meaning of the signal, commenced to turn. Then, in the flash of an eyelid, ship, signal-flags, and everything else disappeared from sight behind an upflung gout of gray water, a vivid red glare, while a thunderous, rolling explosion warned the Boche that his foe was already upon him—ay, and striking at his very heart.

The gout of spume and splinters had scarcely fallen back to the sea ere the battle-lines parted, and through the gaps thus made twoscore torpedo-boat destroyers hurried, their sharp prows tearing through the waters and flinging them down in green cascades as they sought to destroy the submarine which had destroyed already one of their finest battle units.

But though the destroyers quested this way and that, though the shells from their light pieces tore the sea into fountains whenever a fancied periscope was, in imagination, sighted, none of them found L 73, which, deep down, was working her way under the surface to the other side of the fleet, where, if her luck still held, she would get in another shot. After that, so far as Carstairs and his merry men cared, could come the Deluge.

Now, to ensure greater safety, as they thought, the German Fleet scattered this way and that,

breaking up their long orderly lines in accordance with prearranged plans for dealing with submarine attacks. And it was this scattering that gave Carstairs still another opportunity, though the target in this case was not exactly so good as he would have liked.

An elderly battleship of the *König* type sighted his periscope as he rose, and immediately commenced to plaster the sea all around with missiles from her light quick-firers. Then, with astonishing suddenness, she grew silent, the crackles of her weapons drowned in that unmistakable explosion made by a striking torpedo.

'*Habet!*' remarked Carstairs, turning down his thumbs. 'Her age entitled her to respect, but even decrepitude doesn't give one the privilege of being cheeky, does it?'

Jevons turned from the torpedo-tubes for a moment and laughed, and in that laugh was embodied the berserk fighting spirit of the Briton, his heritage from those savage forefathers who preferred long-odd fights to feather-beds.

More destroyers came, some to pick up the crew of the stricken ship, others to deal as effectively with her striker as might be; but these met with as little success as their *confrères* hunting away to port of the scattered battleships. L 73 had gone deep down, where neither shells nor keels may penetrate.

But now she found herself with a task of quite a different sort upon her hands. A big, sea-going *unterseeboote* happened to blunder her way, L 73's chattering microphones heralding her approach. It appeared as though the Boche also possessed underwater ears, for as he closed on L 73 he developed extreme caution. His objective, of course, was the ramming of this intrepid interloper, which bade fair to spoil the plans so cunningly laid by his own High Command; the fact that he possessed specially strong bows for working among Baltic ice made him confident that if he could once get the intruder before his nose, he could easily walk through her without detriment to his own fighting-powers. But, being after bigger game, Carstairs sheered out of his way and sought the surface once more, rising this time under the very stern of a destroyer, which, had she but glanced back, could not have failed to see and *strafe* the craft she was so assiduously seeking.

'Pot her!' yelled Carstairs, as his periscope caught her fleeting shape. 'It'll shake their *moral* if the hunted disposes of one of the hunters. Fire, Jevons!'

Grinning like a heathen deity with the exhilaration of the combat, the sub pressed down his firing-key, and the missile blew away the destroyer's rudder and screws, as well as a goodly portion of her stern, and left her, a heaving wreck, upon the waters, a token of the unseen menace even now causing the best-laid plans of *Seiner Deutscher Majestät's Marinamt* to gang sadly agley.

Strange to relate, Lieutenant Carstairs was loath to share the enthusiasm of L73's crew at the thrice-repeated success. Every time, at the end of the prescribed interval, the sudden shuddering heave of the boat under the communicated influence of the torpedo's explosion made him grip at wheel or stanchion to preserve his foothold; every time the reverberating explosion sounded like sweet music in the Britons' ears, the lieutenant smiled grimly and crossed his fingers.

'It's too good to last,' he said softly. 'We're having too many lives. Anyway, if we go west now we'll have plenty of company on the long road; and if we aren't booked this trip, I'll never despair of any future tight corners we may get into.—Stand by the tubes'—this quite audibly. 'We'll chance our arms once more.'

This time L73's periscope-tip poked itself through a patch of clear water some hundreds of yards wide, well to starboard of the huddled fleet, which, like a flock of frightened sheep, crouched together and bleated piteously with their steam-sirens, begging the fast destroyers to rid them of this enemy which, herself invisible, might strike any one of them at any second. And, as luck would have it, instead of having been gathered into the centre of the huddled mass for protection, like her sisters, one of the huge transports had been left outside, and was now zigzagging this way and that at high speed, manœuvring and twisting to evade torpedo attack, and at times turning on her own heels so as to be within reach of her consorts' boats should disaster overtake her.

'A sitter, by the Great Hook Block!' cried Carstairs. 'A transport full of Boches!—Jevons, give her a pill; we'll stay and watch this shot, seeing that nobody's sculling round this quarter.'

The submarine dipped slightly as the torpedo left its tube; as she righted, Carstairs, at the periscope, had full sight of a narrow white track heading direct for the transport, which, occupied with her turning movements, had not as yet seen it. She stopped and slewed in her stride, so that the weapon, instead of striking her directly amidships, caught her under the after-bridge. She heaved, literally and actually, off the face of the waters in the same instant as it struck her, and, before the echoes of the first explosion had died away, a roar as of thunder a million times magnified split the very heavens, a sheet of lurid flame eclipsed the light of that misty day, and on the outskirts of that sheet were little black fragments that were men or portions of her structure.

'Good God!' said Carstairs. 'What's happened?'

Affected beyond telling by the awful spectacle, the lieutenant yet preserved sufficient presence of mind to take his craft to safety in the depths.

Once she felt the soft embrace of the mud, however, the lieutenant tottered from his stool, and, leaning against the boat's side, buried his face in his hands. The rest of the crew, not having seen that awful cataclysm, looked at him in wonder, and vaguely speculated as to whether their young commander had lost his nerve. His words, however, swiftly put them in possession of the facts of the case.

'We hit,' said Carstairs brokenly. 'I thought she'd sink slowly and give the poor devils a chance of being picked up; but as soon as the torpedo struck she blew to fragments, and I don't believe a single soul aboard her was left to tell how it happened.'

'Must have struck an ammunition magazine, or something,' said Jevons. 'You hit her as she slewed, you said?'

'Exactly,' was the answer. 'She must have commenced the turning movement as we fired, and, instead of getting her under the engine-room, we hit her under the after-bridge.'

'All her own fault, then,' was the cold-blooded answer. 'Serves her right for not keeping a better look-out. Well, are we going to do any more slaughter to-day?'

Carstairs raised himself weakly to the periscope-stool again. 'Might as well,' he said. 'We may never get another chance like this.'

L73 sought the surface once more, almost capsizing a cutter lowered by the German flagship to investigate the holocaust. The coxswain of the cutter fired his revolver half-a-dozen times at the periscope-tube, thereby providing the incentive which helped the wavering lieutenant to determine that he, at least, would show no quarter to this enemy met in fair, though unequal, fight.

He dipped slightly and rose again, this time free of all boats. His periscopic eye fell on the huddled mass of battleships three thousand yards to port, precisely at the same second as, regardless of their own intervening small pulling-craft, these warships opened fire upon him from all bearing guns.

'The flagship's right abeam, lads,' cried Carstairs. 'Now, we'll just add her to the bag, and then lie low for a while. Stand by for a burst of rapid firing. Fire one!'

Regardless of the shells which fell in hundreds all around his periscope—a three-inch tube isn't a good target even to the finest of *moral* and the steadiest of nerves—he sat watching the torpedo's track as it made straight for that great fighting-ship. Then, with a startled exclamation, he dropped his hands.

'That torpedo broke surface half-way across to the target, Jevons,' he cried. 'Fire the other tube. We're directly in line with her now.'

A second long trail suddenly appeared on the water and lengthened itself out parallel with that slowly dissolving into the tumbling waves.

It passed the now motionless first missile and reached its objective. But, though Carstairs plainly saw it bring up against the monster's hard steel sides, though in fancy he heard the clang which heralded its arrival, no following explosion resulted, no stab of flame shot up into the lowering sky, accompanied by a gout of gray water.

'That was a hit, Jevons,' remarked Carstairs. 'But you obviously forgot to take out the safety-pin, and the thing hasn't exploded. Stand by to try again, and, for the Lord's sake, don't make a mess of it this time; the destroyers are just clearing the battle fleet and tearing this way.'

Jevons's face tightened, and the firing-key clicked a third time. Carstairs turned once again to the periscope.

'Down—flood all!' he yelled. 'The destroyers are on top of us.'

L73 dropped to the depths like a stone precisely at the second that the torpedo arrived at its target—and exploded. And, amid the dull reverberations of its explosion there sounded a faint but distinct crack, and water commenced to pour through the lower end of the periscope.

'I expected as much,' remarked Carstairs. 'One of those destroyers has chopped through our periscope and finished our work for a day or two. Block up that hole, some of you; we'll go to the bottom and rest a while.'

Jevons approached, two small pieces of copper wire dependent from his finger by their strings. 'Here are the pins of those two dud torpedoes, sir,' he reported. 'I'd be glad if you'd withdraw that aspersion upon my care in firing, if you don't mind.'

Carstairs looked at his sub, at the pins, and at his crew. 'I'm sorry,' he said. 'But I really thought that in your excitement you'd forgotten that with its pins in a torpedo is worse than useless—it might have been forgiven you had such been the case during these hectic times.'

L73 reached her dockyard port and commenced her preparations for the repair of her damaged eye some days later. She had scarcely docked ere the gold-laced figure of the Port Admiral appeared and called for Lieutenant Carstairs.

'I suppose you've come to tell me I'm to be whipped for treading on Fritz's toes, sir?' began that young officer. 'But it was the chance of a lifetime, and I couldn't possibly let it get past me.'

'On the contrary,' replied the admiral smilingly, 'I've come to pat you on the back. It appears that folks in office are calling you all sorts of pretty names, and talking about giving you a few D.S.O.'s, with maybe the V.C. as a make-weight. You see, we told Russia that whenever her fleet was in any danger we'd send her along

sufficient help to push the Boche back into his defended harbours, if we could; and our Ally, of course, relied immensely on that promise. Now, by popping up and planting your torpedoes into him from various spots, you not only made the enemy believe that he was being attacked by a large flotilla of our submarines, but you have also achieved what scores of diplomatic notes and emissaries could never have done—you've given the Russians to understand that the word of an Englishman is his bond, and that, at the very first opportunity, we've kept our promise about sending them help. And that's why you and your men are all to be decorated and made a fuss of.'

Now, Lieutenant Carstairs had the reputation of never missing any opportunity that came his way. He jumped at this one and seized it with both hands.

'I'm glad Those In Authority are taking it that way, sir,' he responded. 'We had a good time—though there were one or two painful incidents in it, such as when the transport blew up—and we've had nearly all the reward we want in having kept the nation's word. But, if you can so arrange it, sir—and I speak for all the crew—you might try to induce the people who talk about giving us decorations to remember that the keeping of promises is a thing that cuts both ways.'

'I don't quite see what you mean,' put in the admiral, astonished.

'No; but they will,' retorted the lieutenant. 'You see, sir, ten months ago they promised us a month's leave—and sent us to sea the next morning. If it so happens that we've been the honoured instruments of keeping the nation's word to the Russians, I'm rather inclined to think that it is now up to the nation to keep its word to us—to hang those V.C.'s and D.S.O.'s around the necks of those people who've got time to wear 'em, and to hand out the drop of leave which, according to promise, we should have had—and forgotten—long ago.'

#### A PETITION.

MAKE me as sure of future good to be  
As are the sleeping seeds at winter-time,  
Ere Spring has given promise of their prime  
Or any presage of maturity.  
Make me as sure of reaching life's far goal  
As the waves are which strong winds would detain,  
Flinging their crested splendour back again  
Dispersed in foam, maddened by such control.

Make me as sure of love, selfless supreme,  
As the white moon, who is content to fade  
When the dawn strikes her with its accolade.  
So I may fearless live and strive and dream  
Secure from doubt, or how shall I endure  
The interim of fate? Love, make me sure!

### FLIES.

By F. ST. MARS.

#### PART I.

**H**ARVEY-DOTTRELL stood close down by the mud ooze, staring out across the miles of pock-marked flats, desolate of all life except the green scum, and a gull or two, like chalk lumps, here and there. A red disc of a sun on fire sat on ruby and smoking clouds, and the sky around and above was piled in angry confusion as cities aflame.

Harvey-Dottrell laughed, and the laugh, or a peculiar, nasty ring in it, disturbed a little ringed plover, invisible on the mud till then, so that it detached itself from its surroundings, and went away on hooked wings, piping plaintively.

Close to Harvey-Dottrell's feet the tide, draining out from the old and ruined oyster-beds behind his back, charged past in a narrow channel with a song like a Highland stream. A crab crawled slowly and sideways towards it from almost under his heel. A lean, narrow, rakish-looking sort of a fly suddenly batted on to his hand from nowhere special.

And in all the miles, even though so close to a great seaport city, Harvey-Dottrell was as utterly alone as if he had been in the great Sahara.

'A man might die here,' he muttered, 'and never be missed,' and, suiting the action to the word, he raised his little American 22-calibre repeating-rifle, and, turning it wrong end round, placed its cold, hard muzzle against his temple. Stretching out his right hand, he put his finger upon the trigger. It was all quite easy and simple—so easy and simple to end everything.

Five miles away as the crow is supposed to fly, in a dirty street, a street of many streets, street upon street, in the big seaport city, his wife was sitting with the children—four children, all under seven. Close beside her stood a writing-desk, locked, into which she had never seen. It contained, among other things, Harvey-Dottrell's pass-book, which revealed the fact that he had exactly four pounds in the bank. Beneath this, in an envelope, was his insurance policy for eighty pounds. And that was all. And so far as Harvey-Dottrell could see, it was going to be all—the end. There was no earthly chance of anything else, and he must die; he could not face the alternative.

Seven months ago Harvey-Dottrell had invented a preparation which absolutely prevented

flies, mosquitoes (which are flies), fleas (which also are flies), and other animated horrors of insect form from settling upon human beings who had sprinkled themselves with a little of the mixture. It might not seem much, but it meant that sleeping-sickness, fever, malaria, yellow fever, and other plagues of the flesh were as nothing to the possessor of a little of this preparation. It meant that thousands of white men's lives would be saved yearly. It meant that hundreds of thousands of square miles of land, deadly and uninhabitable to the white man till then, could be safely opened up. It meant—oh! dozens upon dozens of wonderful things, and Harvey-Dottrell knew it. He knew it too well. He had given up his profession to run it, and—failed. Nobody would believe him, and a letter from his last hope, an 'official department,' a letter to say so, lay in his pocket at that moment. Thus he had ruined himself; with an invention worth hundreds of thousands of pounds in his pocket, he was penniless, or nearly so, and he was going to be a coward, an utter coward, and die.

You see, he could have faced the comparative poverty of his profession and worked his way up, but the discovery of his fly preparation made him sure that he would at once become wealthy, made him build, ah, such fine castles! And the cold, stark, bitter disappointment of finding that the discovery was so wonderful that no one would credit it, or take it up, was too much for him. He would die. He meant it. He was a man quite capable of carrying out his intention, and quite coolly, too, at that.

The fly returned and batted on his hand again, his right hand, and tickled a little with a peculiar irritating touch of pain.

Harvey-Dottrell felt it, and put down his rifle to brush it away. He would put up the rifle after he had done that, and pull the trigger, and end his sufferings for evermore with a forty-five grain hollow-nose 22 long rifle-bullet, such as he used for shooting large wild-fowl. Just as if it mattered whether a fly was on his hand or not when he pulled the trigger; but he had never blown out his brains before, you see, and quite forgot about that.

He brushed the fly away, and stood suddenly motionless. His face changed slowly from an

awful set, stark determination, to one of slowly dawning surprise, but he did not move. And he remained so long thus standing motionless, with his head a little on one side, that a watcher, had there been one, would have approached nearer, to inquire what had come over him.

Four hundred yards away at its nearest point, the country road, which cut the island in two from end to end, and stretched from the bridge affording communication with the mainland to the little, quiet, but rather fashionable watering-place on the south coast of the island, ran, rather picturesquely, mostly between trees. It was fairly crowded at that time of year—with farm traffic, local bicyclists going down to bathe, motor-cars of visitors, and so forth. Nevertheless, it did not roar. There was not enough traffic for that. Harvey-Dottrell, who had lived in those parts for many years, had never known it to do that. Now it was roaring—roaring with traffic, and the roar, beginning in quite a small way, grew and gradually grew, so that it became steady and insistent, and dominated all else.

Now and again isolated sounds stood out clearly—the shouting of men; the fiend-like blare of some motor-horn, making monster noises more diabolical than its neighbours; once the shriek of a woman, clear and shrill, that set the heart jumping; and several times the cries of children. But these only accentuated the general all-pervading steadiness of the roar, like the roar that you hear on opening the window of an attic looking up to the skies in Regent Street.

Harvey-Dottrell was dumbfounded. He stood aghast. What had happened? What was going on? Or had he gone mad in the effort of slaying himself? He stopped his ears up, and unstopped them. But it was not his ears; the sound was real, a live thing. He turned his eyes in the direction of the road, and his face became blank.

At that time of year a thin dust curtain usually masked the road winding among the trees, but the thin curtain was there no longer. It was a tawny pall, a vast, thick, hanging cloud, high as a house, brooding, dense and strange, stretching far as the eye could reach above and beyond the trees, which it blotted out. Never, in all his experience, even on a summer bank holiday, had Harvey-Dottrell seen the dust above the road like that, or even partially like that.

It was incomprehensible, inconceivable. Harvey-Dottrell forgot all about blowing out his brains, and began walking along the shore of the estuary towards the place where he could turn up a side-lane leading to the road. It was about twelve minutes' walk.

He brushed away the peculiarly insistent fly, as he walked, several times, until it was joined by two other flies, and a wasp—peculiar in such a place—come for moisture, and he was forced to put a little of his own preparation out of a bottle, which he always carried, on to his handkerchief. Flies and wasp instantly vanished.

The sight of the road, as he came to it round a twist in the lane, stopped Harvey-Dottrell dead. The noise had been bad enough, but the view was worse, much worse, and he held his hand to his head, as if he thought he had gone suddenly crazed. He had not, however. It was the road that was mad, or the inhabitants of Cocklesea Island that were upon it—rather, all the inhabitants.

The narrow neck of the lane gave him a circumscribed round view of the road, under an arch of green that was now tawny, like looking through a telescope. He saw a gipsy van and a farm wagon almost locked together, and a vision of man-beaten horses, nearly black with sweat, straining mightily; he saw also a light car, packed to the top of her wind-screen with flannelled men, beating off a swarm of pedestrians that hung to her like flies; he beheld a donkey pulling half a family, the other half pulling, or pushing, the donkey; he beheld, too, a brewer's dray and two great plunging horses, breast-deep in struggling bicyclists; he watched a carriage and pair, both horses on end, bravely restrained by two unhatted footmen, and a little old lady with a white parasol inside cheek by jowl with an unshaven tramp who had climbed up and was hanging over the shade at the back; he viewed a milk-float, filled with squealing children, a spring-cart more than filled with a squealing and enormously fat old woman, lashing vilely at a stumbling scarecrow that had once been a horse, and a woman pushing a perambulator rocking with babies; he watched a thousand-guinea car, cream body, silver lamps, and all awink in the sun, full of pretty, but very white, faces, and frills and frocks and big hats, with two farm-labourers standing on the step, and a ragged small boy hanging on behind, and, almost treading on it, a ramshackle furniture-van, packed with, not the furniture, but the inmates, of a household and any of the crowds of pedestrians that could squeeze in. Five men, mopping their brows and carrying their coats, burst through the hedge in front of him, and crossed the lane, following their own line across country, as quicker than the packed road; and four children, carrying two smaller children, all crying, followed them. And all were going one way—northwards to the one road-bridge that led to the mainland.

When Harvey-Dottrell reached the main road he found that he could hardly get into it, by reason of the struggling confusion of packed motors, motor-bicycles, bicycles, wagons, carts, trucks, and people on foot, that dragged, fought, pushed, shoved, edged, rammed, drove, and strove their way along it. And the dust was awful; it filled the air like a fog, and made Harvey-Dottrell cough heavily. Some had fallen out by the wayside, and women, and even strong men, lay here and there—huddled smudges of clothes. Where there were gaps or gates, people

streamed through them, only, for the most part, to stream back. If a vehicle got locked by the wheel to another, there seemed no hope for it but for them to go along locked, and if man or woman fell out in the road itself—God help 'em!

It was an awful scene, but the most awful thing of all was the faces of the people. Millionaire, pawnbroker, farm-labourer, boarding-house keeper, boarder, butcher, ice-cream vendor, donkey-boy, farmer, fisherman—all held the same fixed, wide-eyed stare of fear, utter, unreasoning, and absolute terror. Thus do people act and look who flee from a plague.

True; but it was not this that had set Harvey-Dottrell suddenly gasping and clutching at his throat; it was the action of every living, hard-breathing, sweating soul he saw, for it seemed that, besides being frightened almost beyond speech, they were also, one and all, mad—mad as the proverbial March hare. And their madness was madder than anything ever heard of, for it took the form of a delusion, apparently, that they were fleeing from flies, or wasps, or mosquitoes, or something, so that the whole road was a river of waving, beating, fanning, pawing arms, hands, handkerchiefs, papers, fans, leafy branches, hats, caps, and rolled-up articles of clothing, in one great, grotesque, strenuous, multitudinal flutter, which was so utterly absurd that it made Harvey-Dottrell leave off clutching at his throat, and burst out into a harsh and cackling laugh.

Perhaps it was the strain on his nerves. Perhaps it was the hot sun. I don't know. He certainly laughed, and as he laughed a very fat man, with a very fat woman and two 'maids,' in a great, slashing, palpitating, red, forty-horse-power car, that had stopped near by, jammed nearly into the ditch by the press of traffic around, looked up, and said, in a harsh, abrupt voice, 'What the devil are you laughing at, man? Why aren't you running away, like the rest of us? Mad?'

'Not quite,' replied Harvey-Dottrell; 'but it seems that you all are. What on earth's up?'

'Up? Oh Lord! Here's a fellow doesn't know what's up,' the fat man shouted suddenly at the two maids, who began squealing at him, in terror, to get on, and then, to Harvey-Dottrell, 'Haven't you heard? The flies! The plague! They're carrying it all over the place. Fifteen people dead in an hour this morning. My God! Ah, here's my chance!'

The traffic ahead opened out a bit to make way for a horse, which, backed on to by a wagon ahead, suddenly seemed to have gone kicking mad. The man barged the car full into the open space, knocking the horse sideways, amid shouts and screams, and as he did so the fat woman, leaning out, yelled suddenly at Harvey-Dottrell, above the din, 'Aren't you afraid?'

And Harvey-Dottrell, who had gone all at once very white about the lips and the forehead at

the mention of the word 'flies,' shook his head. 'I'm immune,' he holloed, with a bitter laugh, and then stared, for the effect of that one word 'immune' upon the very fat woman was astounding.

There was just time, as the big car surged forward—he had been a little ahead of it when it stopped—to snatch out a visiting-card from a cream-and-gold bag thing she carried, amid numerous broad gold bracelets, on her full arm, and fling it at him. 'Go to my room in our house at Cocklesea,' she shrieked at him, purple-faced and standing up, 'and get my jewels. There's our London address on the card. I'll give you five hundred pounds!'

She sat down with a bang as the car heaved forward, and was lost to view in a cloud of dust, petrol-fumes, horses' heads, and people's heads, sneaking in after the car, in the hope of getting through behind it, and Harvey-Dottrell was left, dazed and befogged, mechanically picking up the visiting-card almost from his feet.

Every one knows Angmering's, the great London emporium of general cheap goods. Exactly. So did Harvey-Dottrell. It was the visiting-card of Mrs Angmering that he held in his hand, and upon the card was printed the address of the house, 'The View,' at Cocklesea, which the Angmerings had bought for week-ends, and the address of their town house.

The Angmerings were immensely wealthy; men said that nobody knew quite how rich they were, and that Mrs Angmering's jewels were worth a king's ransom—some kings' ransoms. Mrs Angmering was the stout lady of the big car, it seemed, and the rotund driver Angmering himself, no less. They must have been very hard pushed to come away without their jewels, Harvey-Dottrell reflected; and, by the same token, their offer of five hundred pounds for the recovery of the same was probably pretty sincere. Wherefore, pondering these things, Harvey-Dottrell started to walk the two miles to Cocklesea, due south, as best he could, across the fields—the one road was out of the question.

It was not his way home, which lay in the opposite direction—that is, towards the mainland, a fifteen-minutes' tram-ride off; but no matter. He was not quite himself this afternoon. He was still tingling with the strange excitement and panic going on around him, and with another excitement that seemed to be in the air, and to be stretching everybody's nerves to breaking-point almost.

As he scrambled through the hedge, and made his way across the first field, all dotted with people straggling—and struggling—along in the opposite direction—every one in the opposite direction to him—he noticed that the sky in the west was a dull copper, though the sun still shone overhead with peculiarly brazen persistence. A puff of warm wind suddenly struck him nearly on the back of the neck—that is, from

the north-west; the next puff, four minutes later, came from the north-east. Both vanished as suddenly as they had come, and there was a perfectly dead calm—such a calm that the gulls away out on the estuary were almost unable to fly, and in the calm Harvey-Dottrell could hear them screaming all together, miles away, above the din on the road. Being an ornithologist, he knew that the feathered ones do not speak in vain. There was weather coming.

It was not a pleasant walk. The heat was too great, for one thing, and the consciousness that he was, if the panic of the populace counted for anything, walking into death for a possible five hundred pounds, was too much in charge of Harvey-Dottrell's mind to make it so. But it, was at least dying for something, at any rate, putting up a fight; and that to Harvey-Dottrell was joy, as the burning of essence of ginger is joy to the man with raging toothache.

In one corner of a farm lane, under the shade of some trees, and all alone beside a little pond full of 'skaters,' he found an old man lying down, and tired out, and from him, after he had revived him with a little whisky from his flask and a few biscuits, he got enlightenment.

'It ain't no bloomin' good; ef I does 'ave this 'ere plague, maister, I be done, that's what I be, and couldn't go noways farther, not ef you was t' pay me ever so,' he wheezed; and Harvey-Dottrell, looking at him, agreed.

'You want an hour's rest,' suggested he.

'I does; that's a fact.' The old fellow wiped his face, beating away the flies, which, by-the-by, were not imaginary, for the flies were most insistent, as only they can be in some country places at certain times; but it was noticeable that they all kept their distance from Harvey-Dottrell. Then he regarded Harvey-Dottrell, and stared him up and down in blank surprise. 'But what be the matter wi' you?' he questioned suddenly. 'Why baint you a-runnin' for th' bridge?'

Harvey-Dottrell smiled dubiously. 'Firstly, I have something that keeps flies away,' he answered. 'Secondly, I don't know yet what all this talk of plague is about. I've only just come from the shore, really.'

'Oh, lordy!' The old man left off beating at the flies and stared at him. 'Don't ye know as two London gents comed down by the 11.50 train wi' a gurt big glass case inside o' a gurt big wooden one, an' th' railway chap as was a-deliverin' of it, 'e drops an' smashes th' 'ole bloomin' bag o' tricks, and out comes swarms an' swarms o' flies, an' th' two gents, they nearly goes mad? They was a-rushin' about a-tellin' everybody they was doctors a-studyin' of th' plague, and that these 'ere flies, they was inoculated with this 'ere plague 'nuff t' kill every blame body on t' 'ole island 'bout ten times over, an' that they would start about

a-killin' of all o' us sharp. Run? You never see'd! Most folks they jist takes an' drops whatever they was at, like, an' they run, an' they run, an' they run t' git off th' island quick'n ever th' devil split 'em amainways.'

'How d'you know all of this, then?'

'Ow does I know? Why, 'cause I was a-sellin' oranges on th' beach just outside their 'ouse.'

'Any people die, or anything?' Harvey-Dottrell had become suddenly alert and interested.

'Die? Lord! There was one old lady, she was took a-sudden like when she 'eard 'em, an' she took an' died; an' an old toff in a barf-chair, what I knawed 'ad a weak 'eart fer years, 'e lets out a gasp when they tells 'im, an' they carries 'im out a corpse; an' any amount o' folks complained they was feelin' bad all of a sudden like. Gawd! but there was a-goin's on, I can tell 'ee, but whether 'twas th' fright, or th' flies, or th' 'eat, I dunnows. Anywhichways, no flies ain't a-bitten me yet, but I reckon they will time I gets goin' agin; and the old fellow waved a huge red handkerchief ferociously. 'Ain't you scared?' he asked, regarding Harvey-Dottrell suspiciously, after his kind.

'Not in the least, I guess. I've got something on me that absolutely prevents all flies coming near me. Try some,' Harvey-Dottrell announced enthusiastically; and before the old man could protest, he had tipped a few drops of his queer-smelling preparation upon that rampant red handkerchief.

'Thank 'ee, but I'd rather it 'ud been a pipe o' baccy,' the old fellow answered, and then he suddenly sat upright. Every fly in his vicinity had vanished. 'Well, I'll be'—But words failed him, and he could only go on staring.

'Good enough, isn't it?' asked Harvey-Dottrell, with the air of one 'grassing' a tiger first shot.

'Lord bless my 'eart an' soul!' The old man turned and glared at the inventor with a sudden cunning interest in his rat-like eyes. 'But—will it last?'

'Last? Last?—yes. That is, last twenty-four hours, anyway.'

Harvey-Dottrell was too delighted with this opportunity to show off his discovery, if only to an audience of one, to notice the quick smile, hidden instantly behind the handkerchief, that convulsed the old man's features, and the furtive look of rat-like cunning that flickered into his bright eyes.

'Well, I 'ope it will—'ope it will. Thank 'ee, sir; thank 'ee. An' now you 'll want to be a-goin' on. Don't let a old gaffer of th' likes o' me keep ye. Anythink important, ef I may make so bold?'

'Only a commission for a lady who's left a trifle behind her.' Harvey-Dottrell tried to speak airily, but the rat's eyes were watching him, keen as daggers, the whole time. 'Yes,

I think I will be moving. Good-day. Hope you'll get home all right.' And he hurried on his way.

At least, he felt, he knew more than he did before, and could fairly well grasp the situation.

Possibly the Angmerings were out in their car somewhere when they caught the panic, and were afraid to go to their house; but, anyway, it did not matter to him now.

## THE TAKING OF RANGOON.

By DAVID MACRITCHIE.

**I**T was during the consulship of the second Lord Amherst (1823-1828) that the rulers of India found it necessary to invade Burma. These rulers were first and foremost the East India Company, although Lord Amherst represented the Crown, and although the Company's forces were supported by those of the King. But the dominating position which we then held in the East had been won for us and was still maintained by that great and powerful organisation known as the East India Company. At the time of the first Burmese war our effective fighting force in India numbered 274,000 men, European and native, the great majority of whom were the soldiers of 'John Company.'

The supreme position occupied by the Company is directly acknowledged by the author of a series of coloured engravings descriptive of the taking of Rangoon, published in 1825, and inscribed thus: 'To the Honorable the Court of Directors of the East India Company these Eighteen Views taken at & near Rangoon are respectfully Dedicated by Permission by their Grateful Obedient Humble Servant Joseph Moore, Lieut. of His Majesty's 89th Regt.' These engravings will be referred to presently in detail. But it may be remarked in passing that, in spite of the supereminent services rendered by the Company's army, the King's officers long affected a superiority over those of the Company, who, indeed, did not receive a proper official recognition of their merits until a few years previous to the Burmese war. Referring to this situation, Mr Beckles Willson, in his *Ledger and Sword* (ii. 356-7), makes these observations:

'It was while Canning was at the Board of Control that the nominal barrier which separated King's from Company's troops was further broken down. Prior to 1818 military officers holding the Company's commission had been excluded from the chief honours of their profession. This had long been regarded as unfair: in the previous year the Prince Regent decided to enlarge the Order of the Bath, and was pleased to direct that fifteen of the most distinguished officers of the Company's service might be raised to the dignity of Knights Commanders of the Bath, and that certain other officers of the Company should be eligible to be Knights Companions.

'After the Mahratta war Sir David Ochter-

lony was selected for the honour of Knight Grand Cross of the Bath: Lord Hastings himself performed the ceremony in camp, at Terwah, on the 20th March 1818. "Sir David Ochterlony," said he to the recipient, "you have obliterated a distinction painful to the officers of the Honourable Company, and you have opened the doors for your brothers in arms to a reward which their recent display of exalted spirit and invincible intrepidity proves could not be more deservedly extended to the officers of any army on earth." Mr Beckles Willson adds: 'The Company's had long been the best-paid service in the world.'

The first picture of Moore's series shows 'The Harbour of Port Cornwallis, Island of Great Andaman, with the Fleet getting under weigh for Rangoon.' Perhaps the most striking item in this scene is a small paddle-steamer which is taking out some officers to one of the men-of-war. This seems to denote that steamboats of a small size were in common use as tenders, even in Indian waters, as early as 1825. The funnel of this one is narrow, and astonishingly tall, nearly as high as the two masts of the vessel. She is flying the ensign of the East India Company, which was the White Ensign of to-day with the addition of seven broad red stripes placed horizontally on the white ground. The general effect of this flag recalls the Stars and Stripes, the canton occupied by the stars being, of course, occupied by a small Union-Jack in the former case. A large, full-rigged ship, with square-sails set, is lying-to in the narrows. From the notes explaining the scenes, it appears that this is H.M.S. *Liffey*, commanded by Commodore Grant. She shows a broadside of thirteen guns, all run out; and near her is a fourteen-gun brig, similarly prepared. It seems evident that the progress of the fleet was likely to be challenged in the crossing to the Gulf of Martaban. The *Liffey* is flying the Red Ensign and several signal-flags. Among the other vessels, ten in number, the Company's flag is nowhere visible.

The next scene is a 'View of the landing at Rangoon of part of the Combined Forces from Bengal and Madras, under the Orders of Sir Archd. Campbell, K.C.B., on the 11th of May 1824.' Here the fleet has come to anchor in the river, close to Rangoon, and the troops are going ashore in fifteen large boats, rowed by

coolies. There is also a ship's cutter, containing a few bluejackets and a naval officer standing erect, superintending the disembarkation of the army. Four of the large boats are flying the Company's ensign. The others show no flag, but the troops in one boat are carrying two Union-Jacks. The soldiers, dressed in scarlet coatees, with white cross-belts, white or grayish trousers, and black shakos, are all standing at attention, with bayonets fixed. There is practically no opposition from the enemy, for the *Liffey* is in the act of delivering a broadside which effectually silenced the feeble fire from the stockades.

A brief analysis of the troops engaged is instructive and interesting. The whole force amounted to about nine thousand men. Only three King's regiments were present—the 13th, 38th, and 41st. The bulk of the force consisted, therefore, of the Company's soldiers. In addition to several Madras European regiments, there were five battalions of Madras native infantry, with large detachments of Bengal and Madras artillery, and the corps of pioneers from Madras.

A special interest attaches to the naval officer who figures so prominently in the scene. For this was no other than Captain Marryat, whose novels have been the delight of many generations of British schoolboys. At this date he was thirty-two years of age, and was in command of H.M.S. *Larne*. It is stated that his men suffered severely in river-work and stockade-fighting during this campaign. He himself was made a C.B. in acknowledgment of his services on his return home. It was not until 1829 that he began, with *Frank Mildmay*, his career as a novelist; and if a ball from a Burmese match-lock had laid him low, he would only have been remembered, if at all, as a gallant and promising naval officer.

The Great Dagôn Pagoda forms the subject of several of the succeeding pictures, the time represented being after the fighting, when the British were in full possession of the place. Officers are seen strolling quietly about, and one—probably Lieutenant Moore himself—seated on a camp-stool, is making a sketch of the Pagoda, his servant holding a large umbrella over his head to screen him from the sun. The uniforms are instructive, the trousers worn being in some cases white 'duck,' and in others blue 'jean.' The latter was certainly the more suitable colour for a campaign, and it may be noted that the troops employed in the siege of Bhurtpoor in 1825–1826 are all depicted as wearing blue trousers. Nevertheless, the picture which shows the attack made on the Rangoon stockades on the 28th of May 1824, from the landward side, represents the nether garments of officers and men as made of white 'duck.' The same costume of scarlet jackets, or coatees, and white trousers is seen in the picture of 'The Storming of the Lesser Stockade at Kemmendine, near

Rangoon, on the 10th of June 1824.' One can hardly imagine anything less like a 'storm' than this scene. It is true, the Burmese are blazing merrily away from behind their stockade, and they have succeeded in hitting two of our men, who are lying on the ground, dead or dying. But the British soldiers are marching calmly up to the stockade, four deep, with 'sloped' muskets and fixed bayonets, as if they were on parade. One, indeed, has fallen out in order to fasten his shoe-lace. It has occurred to the officer who is leading that it is the correct thing to brandish his sword on entering the breach in the stockade, and certainly some sign of antagonism is called for, seeing that the enemy are firing at him only a few feet off. However, they might be using blank-cartridge for all the effect their fire has upon the leisurely attackers.

But one must not be too severe upon an amateur artist. After all, the pictures do commemorate actual historical events, if somewhat inadequately. When considered in connection with the explanatory notes, they become quite intelligible. The first of the two scenes just referred to, that of the attack of 28th May, is explained thus in the notes: 'The force employed upon this service consisted of four or five companies of his Majesty's 13th and 38th regiments, with about 250 seapoys of the 3rd, 10th, and 17th regiments of Madras native infantry, commanded by Major Wahab, with a detachment of Bengal artillery and pioneers. This scene is close to the village of Jauayhyvaug; the troops are represented advancing in an echelon of companies, with their left near the stockades, while the party in advance is covering their deployment. . . . The figure seated and wounded in the arm, on the spectator's right, is a Mr M'Kenzie of Calcutta, who was an amateur upon this occasion.' The gentleman in question, clad in an elegant gray suit, with a tall hat of the same hue, is seated on the ground under the shade of a large umbrella, and is supported by a naked and sympathising coolie. Another explanation is instructive: 'The figure up to the head in the swamp is an Arminian who accompanied the general [Sir Archibald Campbell]; and when the firing commenced from the Birmans he hid himself, to avoid being shot, up to his neck in the swamp.' This cautious 'Arminian' is very carefully portrayed by the artist.

It is stated that on this occasion about three hundred of the Burmese, who were led by the Prince of Prome, were killed. The annotator mentions only three casualties on our side—Lieutenant Howard of the 13th Regiment killed, and Lieutenants O'Halloran and Michell of the 38th severely wounded. These were all King's officers.

The pictorial representation of the attack on the Kemmendine stockade, some distance up the river from Rangoon, is better understood in the

light of the written description: 'The army arrived before it early in the morning of the 10th of June, and a breach being made from the battery in the distance, about eleven o'clock Sir Archibald Campbell ordered it to be stormed, and it was carried in a most gallant manner by a large detachment of the 41st regiment, commanded by Major Chambers, and of the 2d Madras European Regiment commanded by

also conveying troops to the shore. As before, the steamer flies the Company's ensign, and the same flag is fluttering from one of the warships and from all the launches. There is only one instance in which a flag of the Royal Navy is seen. As a matter of fact, the war was waged by the East India Company, whose finances it strained severely, and the ultimate cession by the Company of the provinces of Arakan and Tenasserim is more acquisition of territory for the Company for our future Indian

history of the East India Company duly chronicled, we are apt to forget that it occupied a truly royal, for the link uniting it to the Crown rather than official. That is not dictated to by the British Government though it was composed of British subjects, the position of the Company is illusory enough, by the story of the commander for the expedition or, undertaken in 1825, before the war was over. On the directors' objection to the Duke of Wellington, 'You can't do better than Wellington,' He's the man to take it, but we don't think very highly of Wellington,' objected the directors. 'I don't consider him a man of any account,' I don't care a damn about his position; 'I tell you he's the Duke of Wellington.' On this advice Committed by the directors, and he did

The point of this incident is that Wellington was in a position to pick and choose the leading soldiers of the British Army, hire them to carry out its duties, therefore, of a technical alliance with the British Crown, the place occupied by the Company was so high as to justify Mr. Gladstone's opinion of it as 'an Oriental sovereignty, absolute dominion over 200,000,000 subjects, attained an opulence unmatched of Europe, and exerting a rule as great as the days of the Cæsars.'

R L.

foliage glossy brown cones held themselves in readiness to obey the laws of gravitation, and by-and-by to fall with a thud at the foot of the parent tree, a number of crested woodpeckers were holding a lively altercation. Tap-tap! The young ones were for lingering. Even if the nights, argued they, were already somewhat sharp and the days short, yet was the sun still hot, and

was to be extracted from beneath the bark of bole and bough. Tap-tap! The old ones cocked their heads on this side and that, flaunting crimson crests against the blue sky, and voted for the sheltered valleys and woods of the distant foothills, whither the merry gray squirrels were already betaking themselves, to fatten and wax daily more beautiful before winter set in.

Summer had come and gone, and autumn, never long-lived in the Granite Mountains, was

coolies. There is also a ship's cutter, containing a few bluejackets and a naval officer standing erect, superintending the disembarkation of the army. Four of the large boats are flying the Company's ensign. The others show no flag, but the troops in one boat are carrying two Union-Jacks. The soldiers, dressed in scarlet coatees, with white cross-belts, white or grayish trousers, and black shakos, are all standing at attention, with bayonets fixed. light of the written description: 'The army arrived before it early in the morning of the 10th of June, and a breach being made from the battery in the distance, about eleven o'clock Sir Archibald Campbell ordered it to be stormed, and it was carried in a most gallant manner by a large detachment of the 41st regiment, commanded by Major Chambers, and of the 2d Madras European regiment, commanded by Major Wahab. Major Chambers is represented in the view in the act of getting into the stockade, when he received a severe spear wound in the face from a Birman, who was instantly shot by one of the 41st regiment.' It is added that the Burmese lost above two hundred and fifty men in this engagement.

In all the pictures already referred to, the troops on our side are Europeans, but the 7th Madras Native Infantry figure in the next of the series. Their uniform is the same as that of the British soldiers, except that their head-gear is something between a turban and a busby.

The final attack seems to have been made on the 8th of July, and three of the remaining pictures illustrate its chief phases. Of these, one shows the position of the army previous to attacking the stockades, while another deals with 'The Storming of one of the principal Stockades on its inside.' Here our men are seen in the interior, driving the Burmese before them, while others of the redcoats are scaling the palisades. The brown-skinned Burmese are very scantily attired in loin-cloths of a kind of tartan, in some cases green, in others red, and several of them have a species of light plaid. Their weapons are muskets, spears, and swords. The third picture represents Sir Archibald Campbell's attack from the river, at Pagoda Point. This is a very animated scene. Seventeen launches, crowded with soldiers, are being rowed by coolies towards the stockades, behind which the Burmese are pouring down musketry-fire. Seven ships of war are moored in the river, and the Company's steamer, which has accompanied the fleet from the Andamans, is

also conveying troops to the shore. As before, the steamer flies the Company's ensign, and the same flag is fluttering from one of the warships and from all the launches. There is only one instance in which a flag of the Royal Navy is seen. As a matter of fact, the war was waged by the East India Company, whose finances it strained severely, and the ultimate cession by Burma of the provinces of Arakan and Tenasserim marked one more acquisition of territory made by the Company for our future Indian Empire.

Although the history of the East India Company has been duly chronicled, we are apt in these days to forget that it occupied a truly imperial position, for the link uniting it to Britain was racial rather than official. That is to say, it was not dictated to by the British Government, although it was composed of British people. The position of the Company is illustrated, amusingly enough, by the story of the selection of a commander for the expedition against Bhurtpoor, undertaken in 1825, before the Burmese war was over. On the directors referring the question to the Duke of Wellington, his reply was, 'You can't do better than have Lord Combermere. He's the man to take Bhurtpoor.' 'But we don't think very highly of Lord Combermere,' objected the directors. 'In fact, we do not consider him a man of any great genius.' 'I don't care a damn about his genius,' retorted the duke; 'I tell you he's the man to take Bhurtpoor.' On this advice Combermere was chosen by the directors, and he *did* take Bhurtpoor. The point of this incident is that the Company was in a position to pick and choose among the leading soldiers of the British Army, and to hire them to carry out its designs. In spite, therefore, of a technical allegiance to the British Crown, the place occupied by the Company was so high as to justify Mr Willson's description of it as 'an Oriental sovereign with absolute dominion over 200,000,000 of people, having attained an opulence unmatched in the history of Europe, and exerting a rule unequalled since the days of the Cæsars.'

## THE FORESTER'S GIRL.

### CHAPTER XV.

**I**N the summit of a soaring pine, whose velvety tip of brightest green pointed fingerwise steadfastly upwards, while among the sombre foliage glossy brown cones held themselves in readiness to obey the laws of gravitation, and by-and-by to fall with a thud at the foot of the parent tree, a number of crested woodpeckers were holding a lively altercation. Tap-tap! The young ones were for lingering. Even if the nights, argued they, were already somewhat sharp and the days short, yet was the sun still hot, and

many a delicacy was to be extracted from beneath the rough red bark of bole and bough. Tap-tap! tap-tap! But the old ones cocked their heads this side and that, flaunting crimson crests against the blue sky, and voted for the sheltered valleys and woods of the distant foothills, whither the merry gray squirrels were already betaking themselves, to fatten and wax daily more beautiful before winter set in.

Summer had come and gone, and autumn, never long-lived in the Granite Mountains, was

on the wane. Down in the dense places of the river cañons the black bears had gorged themselves on a wealth of purple huckleberries, and were beginning to sniff greedily at the foot of hollow oaks wherein lay fragrant stores of wild honey. Geese and ducks from far northern haunts had commenced their long, long journey southwards, tarrying to rest and paddle about in the sunlit, peaceful waters of Loon and Laughing Lakes. In short, the great annual trek had set in, and wise heads, amongst whom, of course, the old truculent woodpeckers—tap-tap!—reckoned themselves chiefest, prophesied an early and a hard winter. Vast herds of goats, leaving behind them as mementoes of their 'sojourn in the wilderness' square miles of bush desolated as by a scourge of caterpillars—twig and leaf, bud and bark, devoured by these insatiable mammals—together with strands of fleecy wool on thorn and thicket, and a rank, pungent odour lingering for days in their wake, had moved in dense, bleating, suffocating masses down the long, dust-deep road to the valleys, sly mountain-lion and stealthy coyote creeping along in their rear to pick up many a weakly kid or crippled dam that fell or got lost by the way.

One by one, parties of campers, brown, lean, and healthy, their smoked coffee-pots and battered, greasy pans, their rugs and blankets, rods and guns, all heaped together in an old skeleton wagon drawn by an old skeleton of a horse, had rattled away from spruce-beds and flapjacks, from fishing by day and log fires by night, to the mattresses and meals, the work and worry, of distant, noisy, crowded towns.

Dairymen, whose families and cattle had summered among the cool woods and lush grass of the lake flats, were now to be seen heading for home, not unlike the home-coming of Jacob with herds and wives and 'little ones,' besides dogs, cats, pigs, and poultry, of which the Biblical story takes no account.

The mountain world was streaming out, just as a few months earlier it had streamed in. 'Yes,' reiterated the old woodpeckers, 'it's time we were on the move;' and spreading their wings, they, too, joined the general exodus. The young ones watched them go, shrugged their pinions, and fell briskly again to the interminable business of *boring*. Tap-tap! tap-tap! Not for many moments, however. Their round, bright eyes, looking down, met a pair of large, bright ones looking up; sunburned hands clapped vigorously, and this was followed by a prolonged 'Shoo-oo-oo!' and a merry laugh, as the feathered fraternity, in quick alarm, darted away through the clear sky.

'All going South!' mused aloud the disturber of their peace, and stood a moment dreamily gazing up at the limitless blue, in whose ocean the fleeting birds left no wake. Then, continuing her way, she presently emerged from the thicket, and, not without a slight look of relief,

reached the roadside clearing where stood her cabin home, cheerful, if bare, under the open sky. 'There!' she exclaimed, setting down a basket in which gleamed, ruddy and amber, a quantity of wild gooseberries, alarmingly beset with bristles; 'I guess those are the very last I can find. And, my goodness, what *prickles*!' she added, wrinkling her forehead and critically inspecting her fingers, stained and sore. 'No use trying to make jelly of them; they are too ripe to roll, so I'll boil and strain them for sauce. Dave will like that, with hot biscuits, for supper. Dear me! guess I'm some tired after all. Must have gone farther than I thought, and those stony trails aren't exactly city side-walks!'

Thus ruminating, she seated herself on the door-step, resting her head, bare except for a mass of wavy black hair, against the hard wall at her back, and letting her eyes rove skywards. Presently, so high as to be almost invisible, she made out a flight of geese, flying plough-fashion through the clear air, and filling it with their melodious 'honk-honk-honka-honk!'

'The geese too! All going South!' again murmured the girl. Then—well, she must have slept, for she woke with a shiver, to find herself sitting in shadow, and the sun, which a while ago seemed so high and hot, now merely a halo behind the opposite trees. 'My lands!' exclaimed the girl, jumping up in alarm. 'Sun nearly setting, and not a thing ready for David's supper!' and, snatching up the basket, she darted into the house. Filling her hastily tied apron with shavings and neat bundles of sticks from a goodly box, she knelt to open the stove door, then paused and reached for a match. 'All ready laid,' she ejaculated in tones of tender appreciation, 'though he had to start off so early this morning! Was there ever in the world such a good, kind husband?'

'Was there ever in the world such a good, sweet wife?' echoed a merry voice, and before she could turn, the man who had stolen in unawares tilted back the kneeling girl against his breast and covered her faces with kisses.

'Oh Dave!' she gasped, escaping from his embrace, 'I'm so disappointed. I planned to have such lovely gooseberry sauce and hot biscuits ready for your supper, and'—

'Disappointed!' teased David. '*Disappointed* because her husband is home an hour earlier than usual! And as for the supper, we'll get it twice as quick both of us together, Annie. You've no notion what a crack-a-jack of a cook I am! You get the berries cookin' while I take out the flour and things—Hello!' he broke off, peering into the barrel; 'seems to me we're kind o' shy of flour, darlin', ain't we?'

'Yes, I know,' replied Anita; 'but I had a chance by the goat-herd of asking Mrs King to send us a couple of loaves (the Kings haven't gone out yet, you know), and flapjacks will help

out until you can fetch the sack of flour from the Grizzly, which Charlie promised to haul for us.'

Then, as she watched the forester deftly setting out everything needed for the biscuit-making, not even the grease-rag for the baking-tins forgotten, she suddenly stopped in the middle of pouring a generous stream of sugar into the crimson flood of bubbling berries, and blushing as red as they, stepped across to David, and putting her soft arm round his neck, said earnestly, 'Dave, whatever in the world did you want to marry me for? You know you don't need a wife a tiny bit!'

'What in the world did I marry you for, Ann darlin'? And I don't need a wife, don't I? Gee! that's all you know about it, my dear—all you can know about it, 'cause you wasn't ever here when you *wasn't*!' and he laughed delightedly. 'Now, little girl,' he went on, 'you get busy with the biscuits while I slice the ham. Where's the fryin'-pan? Oh, 'way over there! Why don't you keep it on its own nail? Just as easy, and you can find it in the dark if you want to!'

Anita, floury and flushed, but divinely pretty, chased him round and round with the rolling-pin, 'like a couple of kids,' David breathlessly declared; and so, with fun and chatter, the appetising meal was cooked and eaten, David praising the gooseberry sauce and kissing the sore little fingers that had suffered so much from the prickles on his behalf. Then, tired as he was from his long, hard day in the saddle, nothing would do but he must help to clear away the supper-things, himself briskly rubbing out the frying-pan with clean paper ('The best way,' he explained), and washing the dishes to save his Annie's pretty hands.

'David! David!' she finally expostulated. 'How you do spoil me!' Then suddenly, as if a thought had struck her, 'I wish you'd *smoke*, Dave.'

'Smoke?' echoed David. '*Me—smoke*? Not on your sweet life, darlin'! It's only silly fools and good-for-nuthin' toffs who waste good money on tobacco. I don't intend to fry ham *all* my life, Annie, nor to live in a shack like this. Some day, please the pigs, we'll have a decent house, and you sha'n't work so hard. That'll be better than blowin' away hard cash in smoke, won't it, dear? Why, I was calculatin'— And he proceeded to produce staggering figures as to how many dollars and cents—nay, even gold 'eagles'—a man might squander in, say, thirty years if, &c., &c. But Anita did not hear them, her mind having all at once flown elsewhere as something, deep within her, smarted and resented her husband's expression of 'good-for-nuthin' toffs.'

The latter, however, so engrossed was he in demonstrating his favourite axiom of 'A penny saved, a penny earned,' did not notice Anita's

abstraction, and presently changed the subject by saying, 'Did you look in the letter-box to-day, Annie? Mebbe the bread'll be there, for Duncan passed through on his way to Tahoe.'

'No,' replied Annie. 'Guess I was out hunting for gooseberries just then. Let's go and look.'

So together they went out, his arm around her waist, and under cover of the darkness Anita whispered, 'We've been married two months to-day, David. Had you thought of it?' And for reply came such a squeeze of the trim little waist that the owner cried out for mercy. Then the letter-box was searched, and sundry welcome papers and a big parcel of bread were extracted.

'Why,' exclaimed Anita upon opening the parcel in the kitchen, 'Mrs King has sent three loaves, and I only asked two! But here's something written on the paper. "For the party camping on Goose Lake," she read aloud. 'I didn't know there *was* anybody camping there. Did you, Dave?' David, however, was engrossed in a newspaper, and made no reply. 'I suppose he'll call for it?' she went on, questioningly.

'No,' said Hardy rather shortly. 'Guess I can go in with it. Come along, Annie, and let's sit down by the stove for a bit. I begin to feel about "all in."'

'Poor old Dave! I don't wonder!' cried Anita, with ready sympathy, helping to pull forward a couple of rocking-chairs, cushioned with old camp blankets.

They turned the lamp low, these sentimental young people, opened the stove door so that the glow from burning wood and embers threw a cheerful light about them, and Anita slipped her small, soft hand, with its bright new ring, into David's great, callous palm.

They were very happy, these two—happier than at one terrible hour in their lives either had dreamed they ever could be. Neither to that fearful crisis nor to Gavin Barrie did they ever allude, although for long after the forester had brought home his bride, and with tender devotion strove to atone for the hideous crime he had so nearly committed, his heart was wrung and his conscience scorched by hearing the sleeping girl on the pillow beside him cry out in the darkness, 'David! David! Don't go away! Don't be angry!' As for Anita, although it was with a white face and heavy heart that she had driven the long miles to Keyes Mills to fulfil her promise of becoming the wife of David Hardy, he had, as her husband, proved so gentle and kind beyond her imaginings, that ere long the terrible events of that memorable morning when he had come to fetch her began to seem like some horrible nightmare, and she nearly persuaded herself to accept Gavin Barrie's generous explanation that the forester had been suffering from a touch of the sun. That self-same day

he had taken her away from the station, and left her for a short time in the care of the kind but overworked Mrs King—a time which poor Anita passed in agonies of tears and misgivings, feeling that the many miles of dark, forest road by which she had travelled to this isolated ranch were typical of the dreary, irrevocable life towards which each hour was bringing her nearer. Yet, when, on the morrow after their marriage, David had taken her to his own home, the weary little bride was surprised and touched by the many evidences of his thought for her—pretty bits of china, the comfortable rocking-chairs, even some jugs filled with wild flowers which he had risen before dawn to gather and leave ready as a welcome. The house, too, humble though it was and buried in the wilderness, yet made a subtle appeal to Anita as being the first home of her own that in all her chequered young life she had possessed; and as David's fellow-forester had now nearly recovered from his accident and was anxious to do a good turn for his friend, he undertook a large share of David's circuit for a while, so that the first sense of isolation and strangeness of her surroundings had been relieved by the constant companionship of her husband.

Deep within her heart, like some precious jewel under lock and key, shone undimmed the bright image of Gavin Barrie; but the mere consciousness that this was so, despite her husband's whole-souled devotion, reacted in redoubled efforts to prove wifely and loving, with the result that gradually the sparks of jealousy still smouldering in David's breast were smothered.

This particular evening, however, his mind presently reverting to the letter-box, he said suddenly, in a quasi-plaintive voice, between jest and earnest, 'By the way, darlin', you have never explained to me how it was you came to leave your poor old Dave without any letter that first day after you reached the Grizzly.'

But Anita, tired from her long search for the wild gooseberries, had fallen asleep in her chair, and, roused thus suddenly, asked drowsily, '*Que dites-vous, m'sieur?*'

The foreign tongue, unpleasantly associated in the forester's mind with Gavin Barrie and that portion of his wife's life in which he had no share, together with an abiding sense of resentment that circumstances had deprived him of the more liberal education he coveted, nettled him unwarrantably, and he burst out rather hotly, 'For Heaven's sake, Annie, do talk plain American that a fellow can understand! Guess what's good enough for me should be good enough for both of us!'

'Oh, I'm so sorry, David!' cried Anita. 'I must have fallen asleep and—and—been dreaming,' she stammered a little nervously. 'But what did you ask, dear?'

'Strikes me, Annie,' replied her husband

rather sourly, 'you're always dreamin'. But what I said was that you never explained why you didn't write to me the day after you reached the Grizzly. You knew I'd be expectin' one!'

Anita sat up sharply, turning scarlet, then white, conscious that her husband was observing her closely. 'Why, David, I—I *did* write to you. Of course I did. Mr Axel took it and sent it up by some campers; and you wrote me that you got it all right.'

'That was the next day; you know that perfectly well!' blustered David. 'But you had all that morning before Nat Duncan came in. What were you doin' then?'

Poor Anita, grievously perplexed as to whether it were best to tell the whole truth—perfectly innocent in itself—yet fearful of thereby arousing David's jealous temper, hesitated a moment—a hesitation immediately detected by the forester, and construed as reluctance to answer his question.

'No need to *tell* me!' he exclaimed bitterly. 'Evidently Nat Duncan was right when he said you were off in the woods somewhere with that d—d Englishman. No thoughts or time to spare for the likes of *me* when *he* was about! But I'll get even with him yet!' he menaced, working himself up into a rage. 'I'll—I'll'—

'David!' cried Anita, springing to her feet and clenching her tiny hands. 'How dare you speak like that to me or repeat the gossip of a man like Nat Duncan about your own wife? And it's not *true* that I didn't think of you,' she went on, bursting into tears. 'I *did* write to you, David—indeed I did—a long, long letter; only, I thought— Oh David, please, please don't get angry again and misunderstand, but I burnt the letter.'

'Burnt the letter!' exclaimed the astonished man. 'For pity's sake, Annie, do stop crying and explain yourself! Why in the world should you burn a letter that you had written to *me*? he asked less hotly.

'Oh dear me!' sobbed the girl, 'how ever can I make you understand? It was very silly and stupid of me, David, but I was afraid you wouldn't like my mentioning—mentioning Mr Barrie so often. You see, we travelled up together in Charlie's wagon, and he was so kind—and'—

The forester suddenly rose, slammed the stove door, and striking a match with a vicious snap, looked at the clock. 'All right, Annie,' he replied shortly; 'you needn't tell me any more.'

'And you aren't angry, Dave?' asked Anita tremulously, looking up at him with great, tearful eyes.

'No, not with *you*,' he answered huskily, stooping to kiss the quivering red lips.

Yet the look on the forester's face was not good to see.

(Continued on page 260.)

## SOME GERMAN PRINCESSES.

By A. FRANCIS STEUART.

TO understand the history of the present even partially one has to examine the records of the past. It is extraordinary how very like certain aspects of the hideous world-war raging round us are to its lesser prototype, the Napoleonic conflict. We cannot understand the Russian Revolution or grasp its meaning until we have weighed the continual struggle between the autocratic reactionaries and the mob of repressed progressives in history since Peter the Great made Russia a Western power. Similarly, if we study German history we find certain ideals, many of which we think wrong, odious, or unworthy, but still ideals to the Germans, and actively persisted in and pursued from early times. These ideals—or some of them—I propose to study in the lives and careers of certain German princesses married into foreign countries, but taking their ideals with them, and clinging to them with a death-like grip.

Germany has, from its plethora of princely families, always been the marriage-mart of princely Europe. This was greatly aided by the German custom of—so to say—exposing princesses for sale to royal bidders, all that was asked in exchange being wealth and an assured income. Love meant nothing in the contract, happiness not a jot. It did not matter what vileness was stooped to, so long as it was condoned by power. An intense and lasting love for *das Vaterland* was combined with the habit of assisting it only from afar with alien money, and never going back to it. No German princess returned voluntarily to die in her own land (like our Queen of Bohemia). No; they died 'with their drawn salary in their hand,' but in the place of exile whither their marriages had carried them, and where they had most assured power and comfort.

German rank is, or thought itself—and perhaps still thinks itself—different from, and superior to, any other kind of rank. It is the feudal idea of superiority by might alone—not the English idea of rank as a reward for service, or the Celtic one that the clan chose the chief to head it in battle—and is the origin of the Boche doctrine that 'Might is Right.' A German *Adel* thought himself of different clay from other men. All Germans were his inferiors if 'unborn,' and nobles of other lands on a different plane only to be equalised by worldly advantages. Hence we get a hideous worship of caste which is without a parallel in any Western country. This rigid caste system led to the doctrine of equal-marriage or *Ebenbürtigkeit*, an equality of birth on both sides which was necessary to create a completely legal princely marriage which

gave full succession to the children. This existed in no other country until it was forced upon Great Britain and Russia by Germanised Courts. France never knew of it. When Louis XIV. married Madame de Maintenon he knew that the marriage, once declared, was a legal fact, and as he did not wish to declare it, and she perhaps was averse to take the title of queen though swaying the power, the marriage remained an open secret.

Morganatic marriage, however (*teste the Almanach de Gotha*), is still an ugly fact. There sprang up the horrid 'conscience marriage' which the Lutheran Church allowed to German potentates who were tired of their first wives, and these confusions and limitations of marriage and legitimacy have given to the German woman, even the noblewoman, a low position and outlook, which few women of other nations would have brooked, and which have, no doubt, been the reason why German princesses married abroad have stooped to such depths of humiliation in their endeavour to live up to a royal marriage.

To give an instance, we may cite the marriage of Henry VIII. of England to the German princess Anne of Cleves in 1539.

Henry was already three times a widower. He had annulled his first marriage, divorced and beheaded his second wife. His third queen had died in childbirth, and now he sought a fourth. His first wife's grand-niece, Christina of Denmark, Duchess of Milan, 'a goodly personage of excellent beauty,' was suggested, and to her (how odd this sounds! but we must remember the table of 'prohibited degrees' was not yet in being) he paid his addresses. She declined the dangerous honour, however, hinting, it is said, that she 'had but one neck.' So Henry turned to Protestant Germany, where the Duke of Cleves had a sister, Anne, who was a damsel of twenty-four. A portrait was sent to Henry, and, regardless of the fact that the lady spoke no language but her own, and, though a good embroiderer, 'could neither sing nor play, . . . accomplishments which were then by Germans considered to be unbecoming to a lady,' a match was agreed on, and Anne sent over to England. Though with some hesitation on Henry's part when he had seen the bride, he having called her 'a great Flanders mare,' they were married. A few months later his fancy led him to get this marriage also annulled, on conscientious scruples, to which he added that he found the bride 'personally repugnant.' But Anne was not a German princess for nothing. Though willing to be divorced, she was not willing to lose her provision; so she became 'queen-dowager,' with the odd status of 'the king's

sister,' accepted the (for the time) huge pension of four thousand pounds a year, remained on good terms with the king and his family, and, far from returning to her native Germany, died enjoying the fleshpots of England—English beef and strong beer—in 1557. when she was buried in Westminster Abbey.

Sophia, Electress of Hanover (a princess of the Palatinate, whose mother was the English princess the 'Winter Queen'), has left us an interesting account of her marriage. She was not particular—except in regard to birth—and her only moral objections to a husband were that she would prefer one who did not beat his wife, and who was not always drunk. She got engaged, therefore, to the Duke George William of Brunswick-Hanover; but all was not plain sailing, as the duke preferred the gay life of a celibate, and though a contract had been signed, handed his fiancée over to his younger brother, Duke Ernest Augustus. The bride expressed her opinion of the matter to her brother, the Elector Charles Louis, in these words: 'I replied that a good establishment was all I cared for, and that, if this was secured to me by the younger brother, the exchange would be to me a matter of indifference; that I would gladly do whatever he thought best, for, looking on him as my father, I trusted myself entirely to his care.' And married they were, and became very happy, and were the parents of our George I., whom our ancestors (and we blame them only) sent for to preserve the 'Protestant religion,' in the preservation of which the Stuarts had been found wanting.

The marriage of this King George I. showed how the Germanic hatred for *mésalliances* could be got over by wealth and power. At first the Electress Sophia could speak no good of her sister-in-law, Eleonore d'Olbreuse, the French maid of honour who had induced her brother-in-law, H.H. the Duke of Zelle, to marry her, or of their daughter, the unhappy Sophia Dorothea of Zelle. Yet no sooner did the last-named become her father's certain heiress than they, she and the duke, disregarding *mésalliances*, married her to their son, George I., with whom she had, as we all know, a miserable life, and expiated her own and her French mother's presumption in marrying a German prince by an imprisonment until death in the castle of Ahlden.

The Electress Sophia's niece 'Liselotte' married the Duc d'Orleans, brother of King Louis XIV. of France, whose first wife (Henriette Anne Stuart) was supposed to have been poisoned. Nothing debarred the German princess from the splendid marriage, however. She changed her religion from Protestant to Catholic without a murmur, and was married. It is said that not till she met her brother-in-law, Louis XIV., was she assured of the innocence of her husband in his first wife's murder. As her biographer says, '*Pour une première conversa-*

*tion de famille ce n'était point banal.*' She lived all her life in France, hating it and despising the people. She openly took part with Germany during the miserable invasion of the Palatinate; yet, once a widow, she never thought of leaving France, but died there full of years as Mother of the Regent.

Charlotte (Liselotte), Duchesse d'Orleans, puts the pretensions of the Germans in a few characteristic sentences. 'I had one day a pleasant dialogue with the poor Archbishop of Reims. He was . . . the first Duke and Peer [of France]. . . . "It seems, madame," he said, "that you haven't very great consideration for us French *ducs*, and that you put your German princes before us." I replied dryly, "That is true." The archbishop wished to know why, and madame replied, "It is the king who has made you what you are; . . . but our German princes owe nothing of their origin except to God, and their fathers and mothers, so there cannot be any comparison." I believe,' says madame, 'that the poor man was ready to die of vexation, but he found nothing to say.' Indeed, it is difficult to answer such a statement. The greatest humiliation this proud German princess was forced to bear during her long life was her son's marriage to the natural daughter of King Louis XIV. and Madame de Montespan—Mademoiselle de Blois. She hated this daughter-in-law with an unconquerable hate, and no wonder, when she wrote: '*Mésalliances* shock me always. It is a pity for the House of Wittgenstein to have behaved so, as it is a good old family, with the rank of count. . . . It will be unfortunate if such a custom spreads in Germany, for it is precisely in this that German houses are superior to those of other nations, as their blood is purer and more noble.'

Caroline of Brandenburg-Anspach, queen of George II., is an instance of the German desire for government, and also of the stooping to any *bassesse* to attain it. Her friend Lord Hervey wrote of her: 'Her predominant passion was pride, and the darling pleasure of her soul was power; but she was forced to gratify the one and gain the other, as some people do health, by a strict and painful *régime*, which few besides could have had patience to support or resolution to adhere to. She was at least seven or eight hours *tête-à-tête* with the king every day, during which time she was generally saying what she did not think, assenting to what she did not believe, and praising what she did not approve; for they were seldom of the same opinion, and he was too fond of his own for her ever at first to dare to controvert it. . . . But that which made these *têtes-à-têtes* seem heaviest was that he neither liked reading nor being read to (unless it was to sleep).' She was forced, like a spider, to spin out of herself all the conversation 'with which the fly was taken. However, to this she submitted for the sake of power, and

for the reputation of having it. . . . For all the tedious hours she spent in watching the king when he slept, or the heavier task of entertaining him while he was awake, her single consolation was in reflecting she had power, and that people in coffee-houses and *ruelles* were saying she governed this country, without knowing how dear the government cost her.' Nor while thus 'governing' the king of Great Britain did she forget she was a German. Lord Hervey continues: 'Wherever the interest of Germany and the honour of the empire were concerned, her thoughts and reasonings were often as German and imperial as if England had been out of the question; and there were few inconveniences and dangers to which she would not have exposed this country rather than give occasion to its being said that the empire suffered affronts unretorted, and that the House of Austria endured injuries unrevenged, whilst she, a German by birth, sat upon this throne an idle spectatress, able to assist and not willing to interpose.'

The way in which the German princesses allowed themselves to be sent to distant countries, there to find bridegrooms, with as little concern as if they had been inanimate, forms curious reading. Lord Hervey describes in 1736 the arrival of Princess Augusta of Saxe-Gotha in England, when she came to marry Frederick Prince of Wales. 'The princess was but seventeen years old when she came to England, knew not a mortal here, and was suffered to bring nobody but one single man with her, so that in this situation, and brought from the solitude of her mother's country-house in Saxe-Gotha at once into the crowd, intrigues, and pomp of this Court, the bare negative good conduct of doing nothing absurd might reasonably prejudice sensible people in her favour. . . .

'She could speak not one word of English, and few of French; and when it was proposed the year before to her mother, when this match was resolved upon, that she should be taught one of these languages, her mother said it must be unnecessary, for the Hanover family having been above twenty years on the throne, to be sure, most people in England spoke German (and especially at Court) as often and as well as English—a conjecture so well founded that I believe there were not three natives in England that understood one word of it better than in the reign of Queen Anne.' Yet the Princess of Wales obtained so much authority over her son George III. at the beginning of his reign that Lady Sarah Lennox, the beautiful girl with whom he was in love, had the spirit to reply to the king's question, 'Do you not think that parents are the best persons to govern?' 'Yes—sometimes,' answered Lady Sarah; 'but a German woman is not the person to govern a king of England.' One rather wishes Lady Sarah had become queen!

It is in the history of Russia that one finds German princesses sent as brides—or possible

brides—as if they had been parcels. Once married, they hardly ever returned to Germany, save (for a time) in the case of Juliane of Saxe-Coburg, whose unhappy marriage founded the power of her family in the greater Courts of Europe.

The first Tsarevitch of Russia for whom a foreign bride was desired was the unhappy Alexis Petrovitch, son of Peter the Great. His father chose for him Charlotte of Brunswick, who died in miserable neglect in Russia later. This did not deter German princesses from regarding Russia as a suitable place to find an 'establishment.' When the Empress Elizabeth desired in 1744 to find a wife for her *chétif* and half-mad nephew, the Grand Duke Peter, she chose as bride Sophia of Anhalt-Zerbst, and that child of fifteen was at once despatched to Russia along with her intriguing mother. More tough than Charlotte of Brunswick, the young Anhalt princess soon embraced the orthodox faith, and took root in Russia in a wonderful manner. She began, without changing her German ideas, to give all her thoughts and actions a Russian dress, and so gain popularity. She did this with such success that on the death of the empress she was soon able to eclipse the power of her husband, dethrone him (he died 'soon afterwards'), and declare herself Empress of Russia, and begin that long reign of success, favouritism, apparent liberalism, and yet real retrograde autocracy for which she has sometimes been styled 'the Great.'

When matching her descendants came on the tapis—though all her own long list of lovers were Slave—her German ideas became pre-eminent again. When her son was marriageable she sent for a Princess of Hesse, and they were married into unhappiness, the bride fortunately dying soon. When her grandsons needed wives she sent, with the same certainty that her commands would be obeyed, to Germany, which was, as usual, not backward with its 'tribute of princesses.' Alexander—afterwards the idealist tsar, whose ideals all failed—married in 1793 the beautiful Elizabeth of Baden; while the mad Grand-Duke Constantine was married to the unhappy Juliane of Saxe-Coburg. The fate of the last-named cannot be described. At last even she, German though she was, could not stand it, but fled—not to her native Germany, but to friendly Switzerland, to die. Her brother, Prince Leopold, always urged her to rejoin her brute of a husband, and so retained the favour of the great Court of Russia. This favour and influence at last brought him the hand, heart, dower, and wealth of Princess Charlotte, heiress of the throne of Great Britain and Ireland, and made the Saxe-Coburg family notable as 'the consorts of Europe.'

It will be seen that no difficulty or hardship ever debarred a German princess from 'a good match' and a high position. No thought of delicacy or certain misery kept them back, and

sister,' accepted the (for the time) huge pension of four thousand pounds a year, remained on good terms with the king and his family, and, far from returning to her native Germany, died enjoying the fleshpots of England—English beef and strong beer—in 1557. when she was buried in Westminster Abbey.

Sophia, Electress of Hanover (a princess of the Palatinate, whose mother was the English princess the 'Winter Queen'), has left us an interesting account of her marriage. She was not particular—except in regard to birth—and her only moral objections to a husband were that she would prefer one who did not beat his wife, and who was not always drunk. She got engaged, therefore, to the Duke George William of Brunswick-Hanover; but all was not plain sailing, as the duke preferred the gay life of a celibate, and though a contract had been signed, handed his fiancée over to his younger brother, Duke Ernest Augustus. The bride expressed her opinion of the matter to her brother, the Elector Charles Louis, in these words: 'I replied that a good establishment was all I cared for, and that, if this was secured to me by the younger brother, the exchange would be to me a matter of indifference; that I would gladly do whatever he thought best, for, looking on him as my father, I trusted myself entirely to his care.' And married they were, and became very happy, and were the parents of our George I., whom our ancestors (and we blame them only) sent for to preserve the 'Protestant religion,' in the preservation of which the Stuarts had been found wanting.

The marriage of this King George I. showed how the Germanic hatred for *mésalliances* could be got over by wealth and power. At first the Electress Sophia could speak no good of her sister-in-law, Eleonore d'Olbreuse, the French maid of honour who had induced her brother-in-law, H.H. the Duke of Zelle, to marry her, or of their daughter, the unhappy Sophia Dorothea of Zelle. Yet no sooner did the last-named become her father's certain heiress than they, she and the duke, disregarding *mésalliances*, married her to their son, George I., with whom she had, as we all know, a miserable life, and expiated her own and her French mother's presumption in marrying a German prince by an imprisonment until death in the castle of Ahlden.

The Electress Sophia's niece 'Liselotte' married the Duc d'Orleans, brother of King Louis XIV. of France, whose first wife (Henriette Anne Stuart) was supposed to have been poisoned. Nothing debarred the German princess from the splendid marriage, however. She changed her religion from Protestant to Catholic without a murmur, and was married. It is said that not till she met her brother-in-law, Louis XIV., was she assured of the innocence of her husband in his first wife's murder. As her biographer says, '*Pour une première conversa-*

*tion de famille ce n'était point banal.*' She lived all her life in France, hating it and despising the people. She openly took part with Germany during the miserable invasion of the Palatinate; yet, once a widow, she never thought of leaving France, but died there full of years as Mother of the Regent.

Charlotte (Liselotte), Duchesse d'Orleans, puts the pretensions of the Germans in a few characteristic sentences. 'I had one day a pleasant dialogue with the poor Archbishop of Reims. He was . . . the first Duke and Peer [of France]. . . . "It seems, madame," he said, "that you haven't very great consideration for us French *ducs*, and that you put your German princes before us." I replied dryly, "That is true." The archbishop wished to know why, and madame replied, "It is the king who has made you what you are; . . . but our German princes owe nothing of their origin except to God, and their fathers and mothers, so there cannot be any comparison." "I believe," says madame, "that the poor man was ready to die of vexation, but he found nothing to say." Indeed, it is difficult to answer such a statement. The greatest humiliation this proud German princess was forced to bear during her long life was her son's marriage to the natural daughter of King Louis XIV. and Madame de Montespan—Mademoiselle de Blois. She hated this daughter-in-law with an unconquerable hate, and no wonder, when she wrote: '*Mésalliances* shock me always. It is a pity for the House of Wittgenstein to have behaved so, as it is a good old family, with the rank of count. . . . It will be unfortunate if such a custom spreads in Germany, for it is precisely in this that German houses are superior to those of other nations, as their blood is purer and more noble.'

Caroline of Brandenburg-Anspach, queen of George II., is an instance of the German desire for government, and also of the stooping to any *basseesse* to attain it. Her friend Lord Hervey wrote of her: 'Her predominant passion was pride, and the darling pleasure of her soul was power; but she was forced to gratify the one and gain the other, as some people do health, by a strict and painful *régime*, which few besides could have had patience to support or resolution to adhere to. She was at least seven or eight hours *tête-à-tête* with the king every day, during which time she was generally saying what she did not think, assenting to what she did not believe, and praising what she did not approve; for they were seldom of the same opinion, and he was too fond of his own for her ever at first to dare to controvert it. . . . But that which made these *têtes-à-têtes* seem heaviest was that he neither liked reading nor being read to (unless it was to sleep).' She was forced, like a spider, to spin out of herself all the conversation 'with which the fly was taken. However, to this she submitted for the sake of power, and

for the reputation of having it. . . . For all the tedious hours she spent in watching the king when he slept, or the heavier task of entertaining him while he was awake, her single consolation was in reflecting she had power, and that people in coffee-houses and *ruelles* were saying she governed this country, without knowing how dear the government cost her.' Nor while thus 'governing' the king of Great Britain did she forget she was a German. Lord Hervey continues: 'Wherever the interest of Germany and the honour of the empire were concerned, her thoughts and reasonings were often as German and imperial as if England had been out of the question; and there were few inconveniences and dangers to which she would not have exposed this country rather than give occasion to its being said that the empire suffered affronts unretorted, and that the House of Austria endured injuries unrevenged, whilst she, a German by birth, sat upon this throne an idle spectatress, able to assist and not willing to interpose.'

The way in which the German princesses allowed themselves to be sent to distant countries, there to find bridegrooms, with as little concern as if they had been inanimate, forms curious reading. Lord Hervey describes in 1736 the arrival of Princess Augusta of Saxe-Gotha in England, when she came to marry Frederick Prince of Wales. 'The princess was but seventeen years old when she came to England, knew not a mortal here, and was suffered to bring nobody but one single man with her, so that in this situation, and brought from the solitude of her mother's country-house in Saxe-Gotha at once into the crowd, intrigues, and pomp of this Court, the bare negative good conduct of doing nothing absurd might reasonably prejudice sensible people in her favour. . . .

'She could speak not one word of English, and few of French; and when it was proposed the year before to her mother, when this match was resolved upon, that she should be taught one of these languages, her mother said it must be unnecessary, for the Hanover family having been above twenty years on the throne, to be sure, most people in England spoke German (and especially at Court) as often and as well as English—a conjecture so well founded that I believe there were not three natives in England that understood one word of it better than in the reign of Queen Anne.' Yet the Princess of Wales obtained so much authority over her son George III. at the beginning of his reign that Lady Sarah Lennox, the beautiful girl with whom he was in love, had the spirit to reply to the king's question, 'Do you not think that parents are the best persons to govern?' 'Yes—sometimes,' answered Lady Sarah; 'but a German woman is not the person to govern a king of England.' One rather wishes Lady Sarah had become queen!

It is in the history of Russia that one finds German princesses sent as brides—or possible

brides—as if they had been parcels. Once married, they hardly ever returned to Germany, save (for a time) in the case of Juliane of Saxe-Coburg, whose unhappy marriage founded the power of her family in the greater Courts of Europe.

The first Tsarevitch of Russia for whom a foreign bride was desired was the unhappy Alexis Petrovitch, son of Peter the Great. His father chose for him Charlotte of Brunswick, who died in miserable neglect in Russia later. This did not deter German princesses from regarding Russia as a suitable place to find an 'establishment.' When the Empress Elizabeth desired in 1744 to find a wife for her *chétif* and half-mad nephew, the Grand Duke Peter, she chose as bride Sophia of Anhalt-Zerbst, and that child of fifteen was at once despatched to Russia along with her intriguing mother. More tough than Charlotte of Brunswick, the young Anhalt princess soon embraced the orthodox faith, and took root in Russia in a wonderful manner. She began, without changing her German ideas, to give all her thoughts and actions a Russian dress, and so gain popularity. She did this with such success that on the death of the empress she was soon able to eclipse the power of her husband, dethrone him (he died 'soon afterwards'), and declare herself Empress of Russia, and begin that long reign of success, favouritism, apparent liberalism, and yet real retrograde autocracy for which she has sometimes been styled 'the Great.'

When matching her descendants came on the tapis—though all her own long list of lovers were Slavs—her German ideas became pre-eminent again. When her son was marriageable she sent for a Princess of Hesse, and they were married into unhappiness, the bride fortunately dying soon. When her grandsons needed wives she sent, with the same certainty that her commands would be obeyed, to Germany, which was, as usual, not backward with its 'tribute of princesses.' Alexander—afterwards the idealist tsar, whose ideals all failed—married in 1793 the beautiful Elizabeth of Baden; while the mad Grand-Duke Constantine was married to the unhappy Juliane of Saxe-Coburg. The fate of the last-named cannot be described. At last even she, German though she was, could not stand it, but fled—not to her native Germany, but to friendly Switzerland, to die. Her brother, Prince Leopold, always urged her to rejoin her brute of a husband, and so retained the favour of the great Court of Russia. This favour and influence at last brought him the hand, heart, dower, and wealth of Princess Charlotte, heiress of the throne of Great Britain and Ireland, and made the Saxe-Coburg family notable as 'the consorts of Europe.'

It will be seen that no difficulty or hardship ever debarred a German princess from 'a good match' and a high position. No thought of delicacy or certain misery kept them back, and

once an income was grasped, it was retained till death. They never went back to their beloved (but poor) *Vaterland*. Prince Charlie's wife, the Comtesse d'Albanie (*née* Princess of Stolberg), cheerfully took her husband's brother's allowance after her elopement with Alfieri, and not only received a pension from her husband's

supplanter, George III., but visited him at his Court in London!

*Ebenbürtigkeit*, foreign allowances, political influence, and wealth were the watchwords of German princesses in all times. They sacrificed much for them certainly, but what they got was perhaps more, to them, than an equivalent.

## THE MYSTERIOUS MIASMA.

### CHAPTER IV.

'I HAVE arranged for you to be freed from the office-work for a while, Miss Fairley,' said the manager the following afternoon, 'and to accept Miss Thorne as your substitute. Miss Thorne, as you know, is familiar with the routine of the office, and fortunately she is at liberty, and quite willing to take your place.'

'But what am I to do?' asked Miss Fairley, taken aback. Then the thought struck her that Mr Kennerley intended her to rest. So she said instantly, 'I have recovered from the effects of the miasma.'

'Happily,' returned the manager; 'and the change will not be permanent—only for a week or two to accommodate Dr Neville.'

'Dr Neville! Who is Dr Neville?' she asked, mystified.

'Ah! That's another lapse. I ought to have said Mr Edge.'

'Mr Edge!' she exclaimed, mystified still more. Then, the mystery clearing, and leaving her slightly annoyed, she said spiritedly, 'Is Dr Neville masquerading under the name of Mr Edge?'

'Not masquerading, Miss Fairley. We owe him too much to describe his innocent disguise by so doubtful a term. He assumed the disguise seriously, not as a play, to investigate more minutely the origin and nature of these treacherous and cruel attacks, and in this way to prepare himself more perfectly to defeat them.'

'The term is unjust,' she acknowledged penitently. 'I ought not to have used it. I should like to withdraw it absolutely.'

'It was my fault,' said the manager.

'Not altogether,' she replied. 'I owe him too much. He saved my life. But—Dr Neville! And she caught herself up with a visible start. 'You don't mean the Professor of Physics?'

'Yes—sent down by Sir William Brandspeth to inquire into the mysterious miasma, to counteract it, and, if possible, to destroy it.'

'And is it at Dr Neville's suggestion that you have arranged to free me from the office-work?'

'For a while; and not at his suggestion so much as at his request. He wants you to help him.'

'In what way?'

'Dr Neville will tell you. I cannot, for the simplest of all reasons. I don't know.'

Leila walked home alone. In the evening, sitting at the same table with him, she was perturbed a little, and restrained in her manner, never once directly addressing him, and feeling it an anomaly when her father or mother addressed him as Mr Edge. The feeling amounted to a protest. She suppressed the protest. But the question arose within her mind, 'Why should the explanation rest with me, the explanation of my temporary release from the office-work, involving, as it must, the disclosure of his identity? Surely he should make the explanation, and, at the same time, tell us frankly who he is.'

'Am I a true interpreter?' he asked later in the garden, where, perplexed, she was trying to smooth the matter out in her own mind.

'What of?' she asked.

'Your mood. Mr Kennerley has spoken to you; probably told you who I am.'

'He inadvertently mentioned your name.'

'And advertently revealed to me yesterday that we are comrades, you and I—members of the same profession.'

She coloured at the word comrades, and turned her searching eyes upon him for the fraction of a second. He was quite serious. If the faintest mocking smile had been visible on his lean, mobile face, if the slightest inflection of irony had been audible in his low, clear tones, she would have shrunk within herself sensitively, as if, with tentative feelers, she had touched something rough, inimical.

'Comrades scarcely describes our relationship,' said she. 'You are at the top of the profession—I only a novice.'

'Nay; more than a novice, Miss Fairley, else you would not have won the degree. And the winning of the degree makes us comrades.'

'The credit of it is not mine so much as Jack and Will's. They made it possible. They almost obliged me to go in for it. I wish you knew them.'

'I hope to know them some day. Sisters generally suffer in a family competition for the advantages of a higher education. Your case is an exception—a notable exception, for your brothers are younger than you. Yes, I should certainly like to know Jack and Will. But your mood to-night, which I have been trying to

interpret, is owing to Mr Kennerley's inadvertent disclosure of my name;' and he paused for her acknowledgment.

She simply nodded.

'Let me dispose of that first. When you came into the garden, I mentioned my name, my real name, with the necessary explanations and apologies, to Mr and Mrs Fairley. They have generously forgiven me,' said he, with a whimsical smile. 'So you need not hesitate now to address me as Dr Neville. That, I hope, will restore the old relationship.'

Again, and swiftly, she turned her searching eyes upon him, and waited for him to proceed.

'It is owing, too—your mood, I mean—to my request that Mr Kennerley would release you from the office-work and allow you to work with me. There was an accidental appropriateness, I find, in that request. If I had known of your special qualification I should have made it earlier. You could have helped me in the analysis of what Mr Kennerley calls the radiation and the people the miasma.'

'Do you wish me to help you in the laboratory?'

'No. I must explain to you how far I have proceeded with the investigation;' and he sat down beside her, unfolded his plan of the works, and spread it out between them. She listened to him attentively. She was deeply interested in his description of the combination of the gases, and the passing of the mixture through the layer of charcoal to neutralise its odour and to absorb its colouring. She could appreciate the description more thoroughly than the manager, because of her partial knowledge of the gases, and her familiarity with the tests he had applied. He had no need to modify or transliterate the technical terms; she readily understood them. When he pointed out the place where he had concluded the gases must have emerged, she drew her brows together and scrutinised it, calling up its appearance imaginatively.

'Do you know the place?' he asked.

'I know every hill and hollow of the dunes,' said she, 'and every foot of the shore, and every crack in the cliffs. I was born here, Dr Neville. When we were children, Jack and Will and I used them as a playground. It may be the place of emergence. A fold in the ground, not a hollow, occurs there, running back from the cliffs. The rock is nearer the surface than in most other places on the dunes. Probably a fracture in the rock accounts for the fold.'

'Probably,' he replied. 'And I am remarkably fortunate in securing your help. Can you recall any opening from the shore where the fold terminates?'

'Let me think;' and again she drew her brows together. 'There is a very narrow opening, a mere slit, that we used to squeeze through. I never went far in. If Will were here he could tell you; he was the most ven-

turesome. Jack was cautious, and I was afraid. But there is an opening,' she assured him.

'I thought there might be.'

'Do you intend exploring it?'

'Not at once, Miss Fairley. Like Jack, I must be cautious. A premature exploration would probably mean the escape of the perpetrators. And I do not intend them to escape. My purpose, primarily, is to catch them, and at the same time, or afterwards—it matters not—to expose their contrivance for spreading among the workpeople disaster and death.'

Leila indignantly exclaimed, 'An infernal contrivance, Dr Neville!'

'An ingenious contrivance,' returned Dr Neville.

'And therefore all the more infernal,' said she.

'Perhaps so. When the war-madness works in the blood of modern nations we must reckon upon it. And we must counteract it. We must meet ingenuity with increased ingenuity.'

'And create a still more terrible inferno?'

'God forbid! I should be sorry for us to descend to contrivances like these. Our business is to prevent an inferno. For that is what the dunes would be if the radiation became explosive.' She shuddered at the thought of it. 'While pursuing the investigation,' he went on, 'I have not been unmindful of the manner in which the contrivance must have been prepared. I can make a guess at it. But that is secondary to the capture of the contrivers. You are familiar with the locality, Miss Fairley. You know the village across the inlet, and you know the town across the bay.'

'Yes.'

'Very few visitors stroll along the beach.'

'Very few indeed; scarcely any.'

'One visitor has been there four times to my knowledge within the past three weeks. Each time he has lingered under the cliff not far from where the opening must be. Once he disappeared there, and I lost him. He comes and goes by the ferry across the inlet. I cannot inquire about him. You can.'

'Why cannot you?'

'My inquiries would arouse suspicion—not yours. He is a slim youth, about five feet four, with smooth cheeks and a dark skin, quick of foot and stepping shortly, dressed like a tourist in a Norfolk jacket and knee-breeches and a full flat cap, all of a brownish-yellow hue that tones and merges with the colour of the sand. He carries a cane, and that, too, is a brownish-yellow. I have not been near him. I have hidden in the dunes, half-buried, and watched him through a pair of binoculars.'

'They must be very powerful binoculars,' said she, 'to enable you to pick out all these minute particulars. He does dress peculiarly. The idea had not occurred to me that his dress corresponded so closely with the colour of the sand.'

'Then you know him?'

'Not personally. I have seen him several times.'

'Does he live in the village?'

'No. He and his uncle lodge in the cottage high up on the Corbie Point, a couple of miles away.'

'His uncle?'

'Yes; an elderly man, white-bearded, who seldom ventures out; an invalid, I think.'

'Who are they?'

'Swiss—so they say—retired, and intending to settle here.'

'When did they come?'

'Eighteen months ago, or it may be two years. I cannot tell you exactly.'

'What is their name?'

'I am not sure of that—Hartmann or Erckmann.'

'In the cottage high up on the Corbie Point, you say?'

'Yes. You must have noticed it—a white-washed cottage, with a long veranda, visible from every part of the dunes.'

'And so commanding the dunes.'

'I hadn't thought of that. It overlooks the bar, and the inlet, and all the shore northwards. There's a nut-grove below it, sheltered by the Point, with a winding path through it down to an old grotto, half-demolished, once the cell of an anchorite—a lonely spot on a rocky shelf just above the long, level stretch of sand. It used to be a favourite picnic-place. Near the grotto there is a wishing-well—a spring of clear water with crooked pins in it, dropped in by curious inquirers, and now dancing on the silt. Of late years it has lost its popularity. Not many go there now.'

'These are picturesque particulars, Miss Fairley, and you have a woman's instinct for them. I am more concerned about the buff youth and his aged uncle.'

'Surely, Dr Neville, you don't suspect them?' she asked, protesting, with widely opened eyes. He admired the frankness of her eyes—the pellucid hazel glowing uplifted with no shadow in them now. The perturbation had passed away, and with it all sense of restraint. She was speaking freely. 'They seem to be quite innocent people.'

'They seem to be,' he responded, taking up her words. 'Nevertheless, I should like to know more about them, and more about their movements; for instance, why, beneath the shelf on which the grotto stands, a clinker-built gig is kept, a light and handy craft, oars within her, and sail rolled up, and mast ready for stepping.'

'Dr Neville?'

'Does it belong to the cottager?'

'No. The cottager is a widow with no children. She could have no use for a boat such as you describe—no use for a boat at all.'

'Some one has. And who if not the lodgers?'

'But, Dr Neville, you said the young man came and went by the ferry.'

'Yes. But on other occasions, and for other purposes perhaps, he may use the boat. My proposal is this, Miss Fairley. Take a holiday. You have been ill. It is common knowledge that you have suffered from an attack of the miasma. Visit the widow. Go by the ferry. Chat with the ferryman. Chat with the widow. Ascertain whether the aged uncle is an invalid; whether, if you are fortunate enough to see him, he is as old as he pretends to be. Say nothing about the gig. The widow may tell you that her white-bearded lodger occasionally visits the town across the bay—drives, maybe. Any other information would be welcome. Can I rely upon you?'

She hesitated. Her eyes clouded again. At last she said passionately, 'I should hate it.'

'Why?'

'It's a spy's work.'

'We are at war, Miss Fairley.'

'I know it.'

'And many lives are at stake.' She started, and turned her troubled eyes upon him. 'Call it patrol-work, Miss Fairley. Drop the word "spy." I like it as little as you. But, whatever we may call it, it is necessary to unveil the infernal contrivance,' said he, purposely using her own word. 'It is necessary to prevent a recurrence of the attack. Your work would not be a spy's work. Is an aviator's work at the front, over the enemy's lines—surveying, photographing, gathering information, preparing to defeat the enemy's design—a spy's work? Yours would be similar.'

'Will is an aviator,' said she proudly; and as she said it her eyes cleared a little.

'Yes, Will is an aviator; and what would be the difference, in principle, between his work and yours?'

'None.'

'Then, Miss Fairley'—he prompted.

'I am ready,' said she.

(Continued on page 268.)

### THE WATCHER.

After the picture of St Geneviève, by Puvis de Chavannes, in the Panthéon, Paris.

SHE stands regardful as the hours go by,  
And the night whitens o'er the sleeping town;  
With hungry, wistful love her eyes look down,  
And count the roofs and towers as they lie.  
Aged she is, and wan, yet courage high  
Speaks in each fold of gracious hood and gown,  
And marks her as the saint of high renown,  
That lonely woman standing 'gainst the sky.

Mother of Paris! So a people's love  
Has named her, who, through all her holy days,  
Lived but to serve with patient willing care  
A people's needs. One prayer she sends above  
Through the long night: 'This people for Thy praise,  
O Master, sanctify.' Such is her prayer.

F. W. SAUNDERSON.

## SEVENTH SERIES

### KRUPPS AND KRUPPISM.

POSTERITY will, we believe, have plenty of evidence which will place the responsibility for the Great War mainly upon two men—Wilhelm II. and Gustav von Böhlen und Halbach, who assumed the name of Krupp on his marriage to Bertha, eldest daughter of Friedrich Alfred Krupp, in 1902. The Kaiser is more than suspect of having business interests in the Krupp firm. War has been the one objective of the concern for a long term of years; and there is plenty of evidence that Krupps encouraged a bellicose policy in all parts of the earth in which they could make their influence felt—and they were many. It is known, too, beyond all doubt, that loans to foreign countries were conditioned by German financiers on a 'drawback' in the shape of a large order for Krupp guns and shells. On the memorial unveiled by the Kaiser at Essen on the celebration of its centenary are inscribed the names of fifty-two countries which have been customers.

On the eve of the Great War, Krupps, with their enormous commitments, having completed, or almost completed, the programme of the German Navy, were threatened with being, so to speak, out of work. The two Balkan wars had surfeited quite a group of customers, and the world at large was wearied of strife and longed for peace. Cannot we figure to ourselves, with some shadow of truth behind the conceit, Krupp and the Kaiser, partners both in a business which flourished upon the destruction of mankind, coming to the conclusion that the day had dawned and the hour had struck when Essen required, in order that it should pile up blood-money beyond computation, and win for them both countless wealth, that the world should run red with blood? At any rate, whether the conceit rests upon actual truth or only upon intelligent conjecture, this is exactly what they have done, and 'every man,' as the adage goes, 'is supposed to intend the consequence of his own acts.'

The story of Krupps is one of the great romances of business. In its origins the firm was inoffensive enough. Friedrich Krupp, the founder, seems to have been a harmless and praiseworthy engineer, capable and industrious. Beginning with one small forge in 1810, he built up a business in great poverty, and always struggling against difficulties. He made some

reputation by his steel dies, which were used at the Dusseldorf Mint, but he left behind him at his death little but debts, and the formula for making crucible steel! It is not clear whether he found the formula himself or whether it was the invention of others. There was a lawsuit about it, which lasted for seven years, and Krupp must be given the credit, as he won the day. He tried to get the help of the German Government in conducting further experiments, but this was refused; and he died, as we have said, in poverty in 1826, in a humble cottage, which still stands at Essen, near the palace in which now holds sway Gustav Krupp von Böhlen und Halbach, the husband of his great-granddaughter Bertha.

Alfred, Friedrich's eldest son (who was only a boy of fourteen at his father's death), carried on the business in his mother's name, mainly with family help, and by his personal industry, in spite of repeated refusals from the German Government to facilitate his experiments and plans, he won through. There are abundant and readily accessible records of the technical details of the developments whereby he inaugurated cast wheel-centres, and cast ingots which weighed at first one hundred and fifty pounds or so, and then four hundred pounds, but by 1851 had reached a couple of tons, figures which seem small enough when we know that the firm to-day, which stands second only to the Creusot Works, is capable of turning out an ingot weighing some ninety tons, but were looked upon as astounding at the time. For years his business was harmless enough. He developed, for instance, the manufacture of machine tools of all sorts, down to roll-sets for the jewellery trade, and cast-steel ingots in bulk, and so on. It was, initially, more from the force of circumstances than of deliberate choice—as the country was already developing that military madness and moral atrophy which Frederick the Great had practised and left as a legacy to his descendants—that Krupp should become the Cannon King. The secret of crucible steel was inevitably destined to revolutionise ordnance, and it was from Krupp's first three-pounder, built in 1847, that the mighty monsters of to-day date their origin. With their forty-two-centimetre howitzer, the first great surprise of the war, Krupps reached their zenith.

The Krupp exhibit at the Great Exhibition of 1851 of a solid flawless ingot of cast-steel, two tons in weight, staggered London, and, indeed, the world, although the biggest gun shown by the firm was only a six-pounder after all, and, looked at by modern eyes, does not seem to have amounted to anything worth bragging about. The honour and glory of this triumph was the turning-point in the fortunes of the firm. Alfred now, at last, got orders for ingots from the Prussian Government, out of which six-pounders were forged at the Spandau Works, the beginning of the German field artillery. This was followed by orders from the Khedive of Egypt for still bigger guns, twelve-pounders and twenty-four-pounders, and the 'die was cast' in a double sense. From this time Krupps never looked back, and the nations entered into an orgy of rivalry in armaments. The Age of Steel had begun! Belgium and Russia followed the example of Egypt, and ordered field-guns and heavy guns. Other firms developed on similar lines, and Italy gave an order for fresh artillery, including a one-hundred-ton gun (which was built by Armstrongs); while everybody remembers the eighty-ton 'Woolwich Infant' manufactured by the same firm. So big steel ordnance arrived, and iron and bronze guns became only curios.

The Franco-Prussian War proved a capital advertisement for the Krupp pattern, and from that time the firm has made practically the whole of the German artillery. Time had brought its revenges, and now Alfred Krupp had things all his own way. He got concessions all over Germany, and increased his works at a most prodigious rate. In rapid succession the firm acquired collieries, iron-mines, smelting-works, and blast-furnaces all over the country; while its workshops were by no means limited to Essen, embracing foundries and engineering-works at Sayn and Duisburg, and, later, steel-works at Annen, and armour-plate works at Magdeburg and Rheinhausen. There is a popular idea that if Essen could be bombed from the air to-day, Krupps would be out of work, but this is a complete hallucination. It would, of course, cripple the output, but the activities of the concern would only be hampered for a time. They are far too astute to put all their eggs into one basket, although we can well believe that the bare idea of their mammoth munition sheds and towns, which cover an area of more than five hundred acres, being bombed from the air never entered their heads.

The association of the business with the German Emperor dates really from the friendship between Alfred and William I., who was mightily enamoured with the mammoth steam-hammers, built, greatly in advance of the times, by Alfred, with his unerring foresight, and then far ahead of anything known in any other country. The personal associations of the firm with the War Lord became, however, much more intimate

when a bosom friendship sprang up between the Kaiser Wilhelm II. and Alfred's son, Friedrich Alfred, and from this time, as we have said, the firm, at any rate, had its path smoothed by friends at court.

Born in 1854, Friedrich was five years older than William II., but there is no doubt whatever that the two men became close friends. It was due to the Kaiser's influence that Krupps were enabled to become the owners of the great Germania shipyard at Kiel (of which for some years they had only been lessees), and so were able to take the lead in every department of construction for the German Navy. There is no shadow of doubt that the whole naval programme of Germany was cut and dried between Krupp and the Kaiser long before the latter's naval dreams became realities. It was 'canny,' no doubt, for the precious pair to get ready in advance for 'sharing the swag' in their first attack upon the wealth of the Empire, and so provide against that very rainy day when the bubble of '*Weltmacht*' shall be burst once and for all. Anyway, the extensions of the Germania yard were made on a prodigious scale, and at an outlay which nothing but a forecast based on certainty could have justified. Its area was increased nearly fourfold until it extended over some seventy acres, and 'ways' and 'slips' were prepared at enormous cost owing to the immense excavations required, amounting to many million tons. The firm was soon in a position to undertake the construction of the heaviest Dreadnoughts from stem to stern, armour-plates being provided from Essen or Magdeburg, and guns, munitions, and shells forthcoming with marvellous exactitude to schedule.

Krupps, too, were quite ready to take on ship-building orders for other countries. All was grist that came to their mill, and they built ironclads and submarines of sorts for all and sundry. Mr M'Kenna electrified the House of Commons in 1909 by declaring that he had precise information that Krupps were prepared to supply all the parts of eight ironclads a year; and unless the drain upon their resources for armament and munitionment has paralysed their activities in that 'cemented plate' which so long held the field, their capacity must have ominously increased in the nine years which have elapsed since this estimate was made.

The growth of German naval construction is no secret, and need not be detailed. Some of the dates are, however, interesting, since they tally curiously with the developments of the Krupp concern. When the Germania yard was leased in 1896 two millions were added to the naval vote. Most people have probably now forgotten all about the arrest of the *Bundesrath* on a charge of carrying contraband in the South African War. This was, however, the excuse which enabled the German Emperor to procure the consent of the Reichstag in 1900 to the

extended Naval Defence Act, which provided for the outlay of seventy-four million pounds on naval construction, and twenty million pounds on dock-yards. Krupps, as a matter of course, skimmed the cream of this gigantic enterprise, and, buying the Germania yard outright, embarked upon those gigantic extensions which we have already mentioned. Five years later the firm had little difficulty in obtaining a loan of two and a half million pounds from the Reichstag for the enlargement of the Essen Works.

Friedrich Krupp died suddenly in 1902, and the Kaiser became the guardian of his daughter, Bertha, and at once floated the business as a company, with a capital of nine million pounds or so, associating himself, of course, through nominees, with the business as well as with the family. It is no secret that he 'arranged' Bertha's marriage in 1906 to Baron Gustav. It was rather a jump from the German diplomatic service in China, America, and Italy, to be the head of this mighty concern; but the Kaiser's estimate of the man has certainly been borne out by results, and although we must remember that Imperial influence no doubt proved as efficacious as business capacity in advancing his fortunes, the head of Krupps has established a record for ruthless capacity.

The competitors of Krupps had on more than one occasion ground for complaining of the excellent information the firm was able to obtain of any rival tenders and estimates; for Krupps made the most of their peculiar position, and on more than one occasion infringed the rules which govern the international commercial code, which is very rigid in enforcing fair-play, and does not brook anything which comes within the limits of sharp practice.

Herr Liebknecht, who is now paying the penalty for his courage in crossing the path of the real masters of Germany, made a very considerable pother in the Reichstag in 1912-13, when he proved that by bribing officers and officials Krupps had obtained access to official secrets. Two directors of the firm and a few others served as scapegoats, who bore the sins of those who sat in the seats of the mighty. They were tried, convicted, not putting up any defence worth talking about, and got off with a very light punishment. Liebknecht, who has shown such amazing independence in the Reichstag during the war, came in for the payment of the real penalty in prison and in the firing-line. In Germany it is risky work fighting 'the machine.'

Krupps' policy is the exact counterpart of that of the other masters of Germany. Their activities have been world-wide. Spain boasts one mine at Bilbao, in the Basque Provinces, which is of real importance. Realising this, Krupps acquired an interest, if not the actual

control. The whole story of their interests abroad has yet to be told. Since the beginning of the war we have had revelations and to spare of their 'underground' work in the metal world. Nickel is, as everybody knows, an essential alloy of steel in gun-making and armour-plate, and the Société des Mines Nickelíferes, although ostensibly French, and, therefore, enjoying extraordinary privileges in New Caledonia, where there are famous nickel-mines, has turned out to be entirely a Krupp concern. It was, too, Krupps who got a monopoly in tungsten, which is indispensable for hardening armour-plate, and essential to the production of 'Krupps' cement.' The monazite sands of Travancore, too, from which thorium, uranium, and other rare metals are extracted, had also passed by actual concession into Krupp ownership. As the story goes, the sand was shipped to Germany at four pounds a ton, while so much as was passed on to British manufacturers was invoiced at thirty-six pounds! Much of the base metal industry of Australia, too, as we all know, had got into German hands, the London middlemen being merely go-betweens. Even after the declaration of war, the British Government found itself actually buying lead, zinc, copper, and manganese from German firms which had been astutely camouflaged. It is small wonder that the Australian Government found a short way of dealing with these manoeuvres, annulling contracts, and cancelling enemy-owned trade-marks with right royal promptitude and thoroughness. It may have been late as a precaution, but it was effectual. It is, however, fervently to be hoped that not all the flabby sentimentality of Socialists and Pacifists will put their 'German friends' in possession again. We have a big battle to fight before we can wrest all the laurels from German metallurgists, headed as they are by Krupps.

The firm is now winning characteristic laurels in a new field of activity. It is bearing a hand in the machinations whereby Germany is seeking to undermine the integrity of every country in the world outside of the alliance of the Central Empires. It has established a gigantic advertising bureau which is aiming at the subjugation of the whole Swiss press, in exactly the same way as it 'influenced' the Italian press, and has essayed to capture the French press. Krupps, of course, as newspaper proprietors, are old hands at the publicity game. It is, indeed, not to be wondered at that they should so far have proved themselves more than a match for all the Allies put together in this campaign of chicanery.

Obvious parallels present themselves between the rise of Germany and that of Krupps. The destinies of the country and the firm are interwoven, and if Germany falls, Krupps and Kruppism fall with it.

## THE FORESTER'S GIRL

## CHAPTER XVI.

**B**EHIND a great bluff of gleaming granite, which on the one side sloped steeply to the edge of a deep, rock-bound lake, and on the other faced uncounted miles of wilderness, rose into the clear morning air a column of blue smoke, whose sharp, resinous odour vied with that of some rashers of bacon frizzling noisily in a pan over glowing coals of pine-knots; while on an improvised grill across one corner of the rough stone fireplace a coffee-pot, whose bright surface proclaimed it new to the job, danced and bubbled. Close at hand, a tree forking near the ground, and spanned at intervals by stout pieces of bark by way of shelves, served as larder, from which a tall, loose-limbed man, glasses on his short-sighted eyes, shirt-sleeves rolled up, was taking a bag of flour, and transferring some of the contents to a large, empty tomato-tin.

'Now for the baking-powder; and I mustn't forget the salt,' he was saying to himself while measuring the respective ingredients with as much exactitude and anxious care as though he had been compounding some priceless prescription. 'Now a judicious amount of water,' he continued, ladling it out cold and sparkling from a pail; then with a wooden spoon he began mixing and beating the batter. 'Grand!' he exclaimed triumphantly, as big bubbles broke and spread in the creamy white concoction. 'I'll put the bacon on one of these tin plates, and then start frying the flapjacks. Wish that fellow would make haste and put in an appearance, or the coffee will lose all its goodness,' he said with the air of a professional cook. 'And I'm as hungry as the deuce! Now where the dickens are those trout, and my knife? For things disappearing from under one's nose commend me to a camp! Ah, there you are!' he exclaimed as a horn handle projected itself from beneath a mass of pine-needles. Then, seizing a fine trout, he set to work on the slippery operation of preparing it for the frying-pan. At that moment, however, there came the harsh scrape of hob-nails on the rocks, a snapping of twigs, and the swish of bushes, as a man in rough-and-ready clothing, and preceded by a red-brown dog racing in the beguiling direction of his nose, appeared, holding aloft a bundle of mail.

'Here you are, Kenneth; a whole stack of things for you—mostly advertisements of patent medicines and artificial legs, from the look of them!' he said, laughing, and tossing the bundle towards his friend. 'There wasn't a solitary thing for me, and it's a goodish tramp across country to the road. I'm hungry enough to devour "Bob"! Look out, Ken; he'll have those flapjacks if you aren't careful! Here, give me

the knife, and I'll attend to the trout while you open your letters.' So saying, he changed places with Grey, and took charge of the frying-pan.

Kenneth perched himself on a log and began nonchalantly glancing over the sheaf of envelopes, chucking them one by one in a heap. 'Rotten lot!' he finally exclaimed. 'Sorry I bothered you to go after the things, Gavin, but one never knows. Hello! what's this?' he suddenly queried, turning over a common-looking envelope, with address scrawled in pencil. 'Don't know this beautiful script, do you, Gavin? And the post-mark is blurred. Who the devil can be writing me from—from'—

'Open it, man!' said Gavin. 'Don't waste time solving riddles when a body's famishing with hunger. Hello! what's up, Ken?' he asked abruptly, seeing his friend's expression change from that of mild indifference to one of blank dismay.

'Oh Lord, Gavin!' he half groaned. 'Wish to goodness I'd never seen the inside of a hospital or knew a skeleton from a scorpion! Well, I've got to go, anyway!' he ended ruefully but resolutely, filling a mug with coffee and condensed milk.

'Go!' burst forth Gavin Barria. 'Go *where*, and *why*? We've only just got here, Kenneth. I'm blown if we're going to pull out again at once!'

'*Me*, I said,' quoth Kenneth Grey, irrespective of grammar. 'You can stay on, old thing, if you can stick it by yourself; but I've got to "hike," as they say in this blessed country. It's that little chap over at Silver Creek again—a pitiful letter from his mother. Here, you can read it,' he went on, handing the ill-written note to Gavin where he sat balancing a plate of bacon and flapjack on his knee. 'You see she says he's "screaming with pain in his lower stomach;"' and Grey laughed mirthlessly. 'Poor soul, I suppose she didn't like to say abdomen—if, indeed, she ever heard of one! But,' he added somewhat anxiously, 'it may be appendicitis—and—no use, Gavin; there isn't another medico within goodness knows how many miles, and if anything should go wrong'— He set down the empty cup and began rolling down his sleeves. Then, glancing at his watch, 'That outfit which brought in the mail wasn't going farther than the forester's; so, if I lose no time, I could catch it by taking the short cut through to the Kings' ranch. If the weather keeps fine you'll stay on here, won't you, Gavin?' he asked with a suspicion of wistfulness in his voice. 'I really should awfully like to have a few more tries for those beggars in the lake,' he continued, glancing over his shoulder to where a gleam of blue

water, ruffled and tempting in the sunshine, flashed among the green pines. 'And maybe, after all, the boy isn't badly ill; his mother is always scared to death about him. The only one, you know.'

'Yes, of course I'll stay,' replied Barrie with his most studied air of indifference. 'But it's rather rough luck on you, Kenneth, to come all the way from the Seine to the Sierras and do nothing but roll pills week in, week out. Blessed if I'd do it!'

'Oh yes, you would, Gavin; don't talk rot. Only, it seems a low trick for me to come out here as your guest, and then leave you to your own devices while I work up a fine practice.'

All this time he was making hurried preparations for his departure, and soon the two friends, with 'Bob' skirmishing ahead, were striking out for the trail which they believed would bring them out near the dairyman's ranch.

'Which way is it?' they presently asked each other, halting in a more than usually puzzling spot, where the trail forked and wandered indistinctly away among the thick undergrowth.

'Bothered if I know,' exclaimed Gavin; then, getting his bearings, 'I fancy we had better keep to the right. Over there must be the general direction of the road, whereas towards the west the lake lies, and all those marshy flats. These trails can be awfully puzzling. I shouldn't care to get caught here in the dark; would you, Kenneth? One might easily be bogged. But let's push on; it's a good two miles or more, I believe, to the Kings' ranch. Hope I haven't led you astray.'

Barrie's bump of location, however, proved to be trustworthy, so that presently, feeling no further doubt, they talked of other things, and as to how Gavin should manage his camp life during the doctor's absence.

'By the way,' said the latter, 'you had better ask Mrs King if the bread is ready. That will help out the flour and save you making flapjacks for a day or two. I expect you'll beat me hollow as a cook by the time I get back, Gavin.'

'Good heavens, Ken!' exclaimed Barrie, 'don't talk as though you were going to leave me stranded at Goose Lake all winter. Wish to goodness you would take your profession as delightfully easily as I do mine!' he concluded, with just a touch of something, whether of bitterness or sarcasm Kenneth Grey did not feel sure.

For a while they walked on in silence, Grey furtively studying his friend; it had suddenly struck him that Gavin was looking a little 'fine,' and the usually pleasant, easy-going mouth a trifle set. He looked older and less—less—Grey's mind groped for the right word. Less 'heart-whole' rose to the surface, to be instantly dismissed. Gavin certainly could not be affected *that* way. No one for him to fall in love with; not a girl had they seen except the

one who had driven away in such a hurry to be married to the forester.

'What's the forester's name?' suddenly asked Barrie, the question coinciding so oddly with the doctor's own thought as to quite startle him.

'The forester's name! Which forester? Why?' he asked in surprise.

'The forester whom you said that man Jackson was going to; the one at Laughing Lake,' replied Barrie carelessly.

'Oh, I don't remember. Niel—Niel Foster or Freeman—something beginning with an F, I think,' said Grey. 'Must be a beastly solitary life most of the time. Wonder how that young woman who travelled up with us likes living in the wilderness! She didn't look that kind; more your *town* lady, and pretty, too. Hello! there's the road and the roof of the Kings' house. I bow to your "bump," Gavin! Seems rather a shame to have you tramp all the way here and back again; and you aren't looking any too fat, my boy!'

'Fat!' laughed Barrie. 'That's the last thing I covet being. But I can hear the rattle of bones and harness. Must be Jackson's team, so we're only just in the nick of time.'

A moment later Grey, not without a twinge of regret, was settling himself and his traps in Jackson's wagon; and exhorting Barrie to take care of himself, and to leave a few trout in the lake against his return, he soon vanished down the road.

Barrie, with a depressing sense of void in things in general, then turned his steps to the Kings' house, where the good woman and her swarm of children were crowded around the door, watching the doctor's departure.

His pleasant greeting returned, Mrs King, in the crude Western manner and speech that continually surprised and jarred upon the Englishman, said questioningly, 'You the feller campin' on Goose Lake that wanted some bread? Well, I'm sorry, but we're most out o' flour, and goin' away so soon that we don't reckon to git any more. But I did bake you just one loaf, if *that* 'll do ye?'

'Yes; thank you very much,' said Barrie, whose countenance had fallen at the opening of her remarks. 'I shall manage very well, I dare say, with flapjacks;' and he smiled the smile that invariably surprised its beholders and won their hearts.

'You goin' to make flapjacks, be you?' she asked, laughing. 'Guess it's the first time, bain't it?' she added, glancing at his hands and running her eye up and down his tall figure.

'Yes, the first time,' he replied; then, 'If that loaf is ready, I should like to take it with me.'

'Why, I'm awful sorry,' rejoined Mrs King, 'but I sent it up yesterday with an outfit goin' over to Tahoe. Nat Duncan, he said he'd leave it at the forester's. *She* wanted some bread too,

and thinks I, "It will be a sight nearer to Goose Lake than 'way down here." Only about a mile from where you're campin' to the forester's, and it's a good *two* mile here. But won't ye come in and sit a spell?"

'No, thank you,' said Barrie. 'But'—for he was already learning the help-your-neighbour creed of the mountains—'is there anything that I can take for you to the forester's?'

'No, I guess not,' replied the woman, turning to the door and herding her progeny in front of

her. 'Just give my love to Annie,' she called after him, 'an' tell her we're goin' out end o' this week or beginnin' o' next. Mebbe she can git down to see us, tell her. Good-bye!' So saying, she disappeared through the door.

For a moment her visitor stood as though debating some question in his mind, then at a rapid pace struck away up the soft, shaded road. The sun was bright; the sky was blue; the world seemed not so empty, after all.

(Continued on page 276.)

## YAMS AND MAIZE AS FOOD.

**REFERRING** to the article on 'Tropical Potatoes' contained in our March issue of 1917, a correspondent in British East Africa writes: 'If the yam is cut, and only part of it is baked at once, the cut surface of the remaining portion rapidly becomes bad, and even the natives will not eat it. If the yam must be cut, this should be done only after the baking is complete. The portion not required for immediate use should be grated; otherwise it will become sticky.'

Our correspondent also forwards a number of recipes for the cooking of yams and maize-meal. These we have pleasure in bringing before the notice of our readers.

### HOW TO COOK YAMS.

First wash the yam, and then put it into a fairly hot oven, and bake until pressure with the thumb makes a slight impression. Pare, and grate with a rough bread-grater. Put into a pie-dish with seasoning, and add one cup of milk, a tiny piece of butter, and sprinkle a very little grated cheese on the top.

The yam also forms an excellent food if simply grated and served plain, or with soups or gravy; but it is useless to attempt to eat it unless it is grated.

### CAKES MADE FROM COLD 'LEFT-OVER' YAMS.

Put any cold 'left-over' yams into a basin, with enough flour or fine maize-meal (with a little salt, a tiny piece of butter, a little grated cheese—or, if preferred, a very little sugar) to make the whole into a paste, soft enough to roll out and fry or bake. The addition of an egg makes the cakes much less likely to break. If carefully cooked, they will both look well and eat well. They are best eaten hot. They are suitable for any meal, and may be reheated again and again.

### 'JOHNNY CAKE,' OR BREAD FROM MAIZE-FLOUR.

Take two teacupfuls of maize-flour (not too finely ground is best), and rub into the flour one ounce of lard, butter, or dripping, one egg, and enough milk or water to make the whole a

fairly stiff batter. A teaspoonful of baking-powder or half-a-teaspoonful of bicarbonate of soda should be added last. Pour the batter into a hot greased dish or tin, and bake about half-an-hour. If eaten hot for breakfast or tea, 'Johnny cake' is delicious, being very light and easily digested. If eaten with gravy or with hot roast meat, it is much more nourishing and more easily digested than many so-called Yorkshire puddings.

### MAIZE-FLOUR LOAF.

Take one cup of wheat-flour and two of maize-flour, a little salt, and a heaped teaspoonful of baking-powder, enough milk or water to make the whole into one or two small loaves, and bake in a good oven for about forty minutes.

### VERY LIGHT SUET-PUDDING MADE WITH MAIZE-FLOUR.

Mix two teacupfuls of maize-flour with half-a-cup of wheat-flour in a basin. Put into the mixture a pinch of salt, a good teaspoonful of baking-powder, and two ounces of dripping or lard. Add an egg, if convenient; if not, simply mix into an ordinary batter with milk and water, and boil for about two hours. If a few raisins or chopped figs are added, this will make quite a good pudding.

### MAIZE-MEAL PORRIDGE.

Take one teacupful of *coarsely ground* maize; sift, and remove any husk. Put the maize into a white-lined or other saucepan with two breakfast-cupfuls of cold water and a little salt. Let it stand on a cool part of the stove for one whole day. If the maize has become too dry, add more water; or, if obtainable, milk is better. It will be ready for the next day's breakfast. If any is left over, it will be even nicer the second or the third day; for the more it is cooked, the more delicious it becomes. This preparation is very good for children, if eaten with a little golden syrup or honey. It is also very palatable if made very much thinner, and baked as a milk-pudding; or if eaten with meat or put into stews.

## MAIZE-FLOUR BISCUITS.

Rub into a mixture of two breakfast-cupfuls of rather coarse maize-flour and half-a-cupful of wheat-flour a quarter of a pound of dripping, butter, or lard, two teaspoonfuls of baking-powder, or one teaspoonful of bicarbonate of soda, and a

little salt. Add an egg, if convenient; if not, use sufficient milk, or milk and water, to make the whole into a paste stiff enough to roll out and cut into biscuits. Bake until crisp in a fairly good oven. The biscuits will be improved by the addition of a little sugar and ground ginger.

## FLIES.

## PART II.

**H**ARVEY-DOTTRELL hurried on, and the sky went dark above him; the hot, brazen sun became first a copper globe, which was put out; and, looking up, he beheld a great dun cloud nearly over his head. A puff of warm wind struck him again, this time from the south-west.

By the time Harvey-Dottrell reached Cockle-sea, it was a town of the dead. Nobody moved in its streets, and upon its beach was neither bather nor holiday-maker, nor child scampering or lounging. All visible human life had left the place, as a 'salt-pan' is left by the ebbing tide; and there was no moving thing in it at all, except two dogs, that yapped, and a canary singing, singing, singing, inside a 'tea-room.'

Harvey-Dottrell knew his way, but as he turned off along the sea-front—it was a common mostly—he carefully loaded his repeating-rifle with eleven solid 22-calibre smokeless 'long-rifle' cartridges, and put plenty more where he could most easily and quickly get at them in his pocket. He had two boxes of a hundred each with him, so had no immediate cause for anxiety on that account.

Although he was a cautious man generally, and had a natural innate cunning of sorts which led him to foresee much and run few unnecessary risks, I don't think he had any real idea of what exactly lay before him. Nevertheless, when he came to the Angmerings' house—a fine, flaring, red-brick and white affair in young grounds—he entered the garden from the back, or gardener's, door, and not by the carriage-drive, where the gold-and-chocolate gates stood.

Once inside, he stood quietly and quite motionless behind an apple-tree, listening and watching. He feared a dog, for one thing; a policeman—if even one remained—for another. He could not very well explain that he had come for Mrs Angmering's jewels to the latter, and the former would not have listened to him if he had.

His entrance had startled one blackbird and two starlings, looting fruit, and from various safe vantages they sat and called him rude names; but there was no sign of beast or man, and therefore, still pausing now and again, he began to work his way from tree to bush, dodging and in approved Red-Indian style, housewards. His rifle he held obviously ready.

The sky was very dark above him, and the leaves rustled suddenly in little whisperings from time to time, with puffs of wind that came from every point of the compass. The air was breathless, as one who waits for a catastrophe, not hot exactly; and, from far away, a breeze-puff brought the sound of a dog howling horribly.

Harvey-Dottrell had dodged his cautious way perhaps half up the garden, when the voice of a man, speaking inside the house, froze him in his stride where he crept. Things being so very still, the voice sounded plainly enough, though Harvey-Dottrell could not hear what it said. But, according to his information, there should not have been anybody in the house at all—it was a big house, such as people like the Angmerings might be expected to own—and Harvey-Dottrell was surprised.

After waiting a minute, he worked round the house by a flank movement, and from behind laurels got a view of the front-door. A motor-car was standing in the drive-way there, and—it was not asleep. There was nobody in the motor-car.

Harvey-Dottrell returned to the back-door under cover, always under cover, and entered. A cat, very long and narrow, with its ears cocked backwards, evacuated the kitchen for some dim fastness up a passage as he did so. The fire was nearly out, and one bright kettle contended weakly against the hum of the flies for mastery in breaking the silence.

It was a big kitchen, but Harvey-Dottrell had no concern with it, except to note—peering round the door and with a ready barrel—that it was empty.

Then he crept up the stairs to the hall—a big hall, with stags' heads about and a man in armour. There was nothing alive in the hall, but Harvey-Dottrell could hear the sound of men talking from the first floor. He retired by the way he had come, and, most silently, ascended another set of stairs—the servants' stairs.

There was the very faintest creak in the kitchen as he got up these stairs, but it was very slight. Empty houses do creak in most mysterious fashion sometimes, and, anyway, it might have been the cat returned.

Harvey-Dottrell's arrival upon the landing of the first floor was sudden and dramatic.

Two men, quite well dressed, were coming out of a large bedroom, which, from its size and commanding south aspect, might be taken to be the Angmerings' bedroom. One of them was carrying a case, the other, two, which looked like jewel-cases. It was very close, and the black cloud had made it almost dark in the house, and the men were both sweating profusely. Also they appeared to be in a hurry.

They were aware, in the same instant, of a bar-like gleam sliding along a raised and wicked, lean 22-calibre rifle-barrel, in the shadow by the servants' staircase; of a voice saying, 'Hands up!' and of a slight, a very slight, noise, as if a chair had been stumbled against somewhere down below. They thought they had several men, in place of one, to deal with, and they put up their hands. The jewel-cases they put on the floor.

There was a pause of exactly twenty-three seconds, while a 'death-watch' ticked in a terrible hurry somewhere in the silence that hung like an invisible pall inside the house and out.

Then Harvey-Dottrell spoke again, trying hard to keep his voice calm. He licked his lips before the words came, for he was not used to this sort of thing.

'Who are you?' he asked.

'We've been sent to fetch Mrs Angmering's jewels,' they exclaimed together.

Harvey-Dottrell tried to believe it was a lie, but he knew that there is no knowing what some people may do when they are thoroughly frightened.

'Keep your hands up,' said he. 'And walk backwards into that room.'

They did as they were bid, Harvey-Dottrell following them towards the jewel-cases, but one of them stumbled and tripped over the carpet. He fell, and there was instant confusion. Followed the snappy, vicious crack of Harvey-Dottrell's repeater twice—it sounded loud and dangerous on the empty landing—and one of the men yelled, as you do yell if you get a .22 long rifle-bullet through the fleshy part of your thigh, and both men were on to Harvey-Dottrell at once. That was because he had been afraid of firing to kill.

To avoid being tripped by one of the men who was diving in at him on his hands and knees, Harvey-Dottrell leaped backwards into a bedroom, where, on the far side of a gorgeous brass bedstead, he stood at bay, covering them with his repeater, and covered by them with revolvers.

The affair had come to a deadlock, and neither side knew, for a moment, quite what to do.

Evidently Harvey-Dottrell was all out, and with his life for sale. Both men could tell that instinctively. They were not. A king's ransom of jewels was worth a lot of risk, but both valued their lives at more. They hesitated for about a quarter of a minute; and, even as they did so, the thick, murky, tingling gloom,

that seemed to be weighing them with lead, and playing prickly tunes up and down the nerves of all three, was riven, from floor to ceiling, with a single sheet of fire, which made them jump. An appalling, deafening, stunning crash of thunder followed. It seemed clean overhead, and made the very house rock. There was a deafening report somewhere, then utter silence, and all three distinctly heard some one hurrying down the last three or four flights of the staircase into the hall.

It was nearly dark, and a warm wind had suddenly evolved itself from nowhere, and was thrashing the trees outside. Doors banged everywhere, for every window in the place was open; and what with that, and the crashing of the thunder and the roaring of the wind, it was almost impossible to keep calm and tell, or hear, or see what was happening.

When the lightning came again and filled the room with a flickering green-yellow glow, Harvey-Dottrell saw that both men were running from the room.

He followed, and peered out on to the landing. A blinding flash showed him both men leaning over the banisters, firing with their revolvers at some one they saw, or thought they saw, in the semi-darkness, going out of the front-door; and showed him, too, as plainly as in sunlight, that there was now only one jewel-case on the landing. The other two, and those the largest, had vanished.

Harvey-Dottrell swore a vivid oath and raised his rifle; but the thunder came again and drowned his words and the reports of the revolvers, and everything became almost dark.

The next flash of lightning showed him, what he could see in a dim way without, that the two men had turned towards him. One was reloading his revolver, and both together were shouting out and asking him who he was, and why he wasn't afraid of the flies and the plague.

'My name's Harvey-Dottrell,' he yelled back, between thunder-claps. 'And I've very good reason not to be afraid of infected flies.'

But if he had announced that he was Ajax, defier of the lightning, himself, it could not have had a very much more astonishing effect upon those two men.

'Harvey-Dottrell?' they both holloed, nearly squealed, together; and then, as, in the middle of a flash that nearly staggered all three, he pulled the trigger, and fired close past, but not at, them, they let out one howl, and went down the servants' staircase almost as quickly as if they had been shot from a spring. It was a most extraordinary retreat, and Harvey-Dottrell was left standing, with his mouth open and his barrel lowered, in absolutely blank and stupefied amazement, alone on the landing, with one jewel-case, and the lightning splashing all over the place like eggs flung into a black box. The whole air appeared to be given over to leaping

devils of flame, and in the heavens above it sounded as if giant carts of the gods were tipping mountains on to a stupendous wooden floor.

By the time Harvey-Dottrell got downstairs the motor had gone. He heard it go for a moment between the thunder. Also, he saw smoke issuing from a top-floor window, and seizing a fire-extinguisher (one of the home-made kind) which he found in a passage, and two buckets of water, he raced up to the servants' bedrooms, where he found that one room was on fire a little. The house had been struck by lightning, which accounted for the report all of them had heard coincident with the first flash of lightning.

Harvey-Dottrell put the fire out easily, because he had caught it at the right time, and knew the value of acting quickly, by which means most fires can be put out; and he then came down again. He picked up the remaining jewel-case, the small one, and started upon his two-and-a-half mile walk back to the mainland. It was useless, he concluded, to look for the other jewel-cases, whoever had taken them.

It was raining hard by the time he got outside, and the dusk had come. It was also chilly, but the restless tingling in his veins had gone, his head held no more fiery cracklings, and the nervous, overstrung feeling in the air had passed with the hurrying storm. He even found himself wondering, as he slipped on his Burberry, how on earth he had been such an unmitigated ass as nearly to blow out his brains—which only shows!

Harvey-Dottrell went straight home, and quickly. He had no wish to be found running about in the wet with one of the Angmerings' jewel-cases, and on the way he telegraphed to old Angmering a skeleton of the facts, together with his own name and address.

Next morning Angmering arrived, and in his little parlour in the little villa in the grubby duplicate street, and much bothered by the children, who would not keep out, Harvey-Dottrell told the whole story from beginning to end, leaving out nothing. His listener watched him while he spoke with that keenness which goes with the making of bricks without straw.

Then spake Mr Angmering, laying his fat hand upon the jewel-case: 'It's no go, old man. You've got the wrong egg. These are Mrs Angmering's *paste jewels*. The real ones were in the two larger cases.' He paused, and Harvey-Dottrell's face became slowly the face of an old man. 'But'—he never took his eyes off his companion—'I'll give you fifty pounds for salvaging these, and another fifty for putting out the fire.'

And Harvey-Dottrell breathed a great breath, as a drowning man breathes who catches hold of a broken spar.

Some six months later Harvey-Dottrell, who had been shooting wild-fowl on the estuary,

was walking back along that same island, towards dusk, to Cocklesea, to catch the train home. He was thinking to himself that one hundred pounds would not last for ever, even with his small earnings, and his thoughts were of a gloomy kind. A cab passed him at the usual 'cab-trot,' the only sign of life on the long, cold, wet road. A sea-fog was swirling inland past him.

Quite absent-mindedly, he glanced up at the occupant of the cab. He saw a little old man with remarkably bright, alert eyes, muffled up in a shabby coat, and instantly he was conscious of having seen that face before, without being able to remember where.

The little old man peered at him, jumped, and shouted, and the cab stopped. 'Be you the bloke with th' stuff for drivin' off flies?' he called excitedly to Harvey-Dottrell, thrusting his head out of the window. And Harvey-Dottrell allowed that he was. 'Then 'op inside. I've bin up and down this bloomin' old road 'bout once a week for the last six months pretty well, a-untin' for ye. Now I've found ye.—Drive on, cabby,' he cried.

Harvey-Dottrell, too much surprised to speak, sank back on the seat beside the old man, thumping his head with his knuckles, trying to remember where he had seen that face and heard that voice before. He could not remember.

The old man leant back and looked at him in silence. His cunning little eyes shone mischievously in the cold dusk like a rat's. He pulled up his trousers at the knee, and regarded his horny hands with a chuckle. The chuckle was like the gibbering of a very old and knowing rat. Then he spoke. 'Don't know me?' he queried.

'Not from Adam,' Harvey-Dottrell owned.

And the old man chuckled more malevolently than ever. 'D'you remember th' old gaffer as ye 'elped when 'e give out that day as th' fly plague came to Cocklesea? Th' old feller as sold oranges?' he asked.

And Harvey-Dottrell jumped. 'Of course I do. You—you're he,' he almost shouted.

'I am that,' was the answer, and the eyes gleamed at him through cigar-smoke till they seemed almost to burn.

'My dear life!' Harvey-Dottrell stared at him. 'But you've gone up in the world!'

'I 'ave that.'

'How?'

'By a-followin' *you*.'

'*Me*? How the devil?'

'Yus, a-followin' of you. It was I as took the jewel-cases; but those darn revolver-bullets, they came main close.'

And Harvey-Dottrell was dumb. He saw it all now—his foolishness in saying that he was going to fetch something (obviously valuables) for a lady; the fact that he had never looked back; the creak in the kitchen, and the sound

later as of some one stumbling against a chair; the mysterious disappearance of the two biggest jewel-cases while he and the men were in the bedroom, and the wild shouting of the two men over the banisters—all now became clear. The old renegade! 'D'you know, you've lost me, my wife, and my four little children five hundred pounds?' he asked at last, angrily.

'Oh! oh ho! Five 'undred, was it, old Mother Angmering offered ye? Well, I ain't lost ye nawthin', me lad. Listen, now.' The old man paused, and for a long half-minute there was that silence which comes when a rodent is disturbed at its work, and is thinking how to act. Then he spoke. 'I got them jewels, an' I wrote to t' old man Angmering a-tellin' 'im as I knawed wur they be, an' askin' what 'e'd pay me. 'E wrote back an' sez five 'undred poun'. I writes back again, an' I sez my terms was two thousand poun' an' silence. 'E agreed. 'E 'ad to, an' 'e got 'is jewels. An' them two gents as come for t' steal t' jewels, they was two as got the sack from th' Government Department for stealin' without reportin' yourn an' other blokes' inventions. I 'ad that from th' copper arterwards. They an' their flies! Poof! It was their game, just t' frighten folks an' get at old Mother Angmering's jewels. I don't believe as any o' them flies 'ad plague at all—at all.'

'Good Lord!' moaned Harvey-Dottrell. 'But you've got a head!'

'I 'ave. Not like yourn, though. Yourn's

full o' uncommon-sense, and mine, 'e's full o' common-sense. I ain't a thief, quite, no more 'n you be, but they do say as there be honour among thieves even. What 'ave I bin a-tryin' t' find ye all this time fer? This, Mister—what's yer name?'

'Harvey-Dottrell.'

'Right, Mister 'Arvey-Dottrell—*this*.' And, so saying, he drew from the depths of his rusty old coat a cheque. Then, with a considerable amount of important puffing, he read it over, spelling each word with silent-moving lips carefully, as the illiterate do, and handed it to Harvey-Dottrell. 'The 'alf,' he said simply.

Harvey-Dottrell took it, looked, and gave one long whistle. The cheque was signed by Angmering himself, was for one thousand pounds, and the name space indicating to whom it was made out was left blank. 'Oh!' he cried. 'Oh, thank God! Thank you. Thank'—But words failed him, and he sat staring at it with moist eyes.

The old man laid his hand gently upon Harvey-Dottrell's shoulder. 'Don't take on, me lad,' he muttered huskily. 'Ye're worth it, an'—an' so 'm I.'

And he leant back chuckling, as the first of the station lights shone upon his little, beady, cunning, sharp eyes, burning in the depths of the cab's gloom. They looked more like the eyes of a rat than ever.

THE END.

## THE BLACK TRACKERS OF QUEENSLAND.

By J. T. CRITCHELL.

THE territory of Queensland, which received its charter of independence in 1859, emerged from obscurity in 1823, when the Brisbane River was discovered. Convictism was associated with Queensland's beginnings, as the three penal establishments at Hobart Town, Norfolk Island, and Port Macquarie were overcrowded. But as settlers began to take up land round Brisbane, the 'exiles,' as the felon-immigrants were called, became unpopular, and the last batch arrived in 1851. From Queensland's earliest days the police were a dominant interest in the colony. The invasion of the pastoral lands by squatters brought about difficulties with the natives. Murders and cattle-spearings were common occurrences, and a military post at Helidon (known now on account of its spring) represented the first police establishment in Queensland.

In 1848 a force of native mounted police was raised to protect the pastoralists and their flocks and herds. The experiment proved very successful; the native police were easily broken in to discipline, and they made dashing horsemen. The black men enjoyed their work, especially when it took the form of administering punish-

ment to members of different tribes from their own. In those early pioneering times an outrage committed by blacks led to the 'dispersing' of the offending tribe—really its wholesale slaughtering when the black troopers' blood-lust had asserted itself. In those days before the coming of public opinion in Australia, the extermination of the 'blacks' was the policy of the squatters, the dominant party. The aborigines were mostly war-like and treacherous, and their attacks on their white neighbours had to be repressed by force of arms. Still, the reprisals of the whites, through the agency of the black mounted police, were unnecessarily severe.

In hunting down criminals the black trackers of Queensland were very useful, and their services in more peaceful ways have continued to the present day. Not only have they been requisitioned in their own land, but they have been invited to help as 'criminal investigators' in the United States in tracking down desperadoes who have taken to the wilds. In this very expert work the black trackers of Queensland are *facile princeps*. It is interesting to note that, whilst as a race the Australian aborigines

are sadly degenerate, in this special duty individuals are as clever and keen to-day—as will be seen below—as in the times when, with extreme relish, they hunted down their brethren in the recesses of the bush.

The ability to track is possessed more or less by all aborigines. It is instructive to note the outcome of the struggle for existence in a country where, to get a living in the bush, the natives have to keep their senses at concert-pitch. Food is none too plentiful there. Australia's wild creatures are few, and wary in habit. To run down a kangaroo or an emu, to dig up the edible roots, to turn out a 'possum from his lair in a hollow log, to snare fish in the lagoon, and secure water in a waterless region, and, in fact, to read off the signs of the bush like a printed page, require sensory faculties highly developed. By constant practice, the native Australian can distinguish the tracks of the animals mentioned from those of lesser game. Did he not possess this power, he could not live in the Australian bush. A tracker will say correctly how long a time has passed since the track was made, and in the case of people known to him he will recognise the footprint as we know the handwriting of a friend. In one instance the tracker stoutly averred that the track he was following was that of a knock-kneed man, and he was right!

Where the eye of the ordinary man can see nothing out of the common, the black tracker finds a whole page of facts. A dislodged stone, a turned leaf, a broken twig, are read off by him as one reads a written page. From a horse's hoofmarks he will describe the animal, and tell you when the impressions were made. The police records are full of such cases.

Here are some instances of the work of the black trackers of Queensland.

In the convict days an ex-convict, Fisher, Campbell Town, near Sydney, mysteriously disappeared. His partner—of the same 'persuasion'—gave out that Fisher had gone to England, and took possession of his mate's property. After a while 'Fisher's ghost' caused uneasiness in the locality, and the police began investigations, assisted by a black tracker named Gilbert. There was a pool of water in the vicinity, and Gilbert took a corn-stalk and passed it over the surface of the water. He then put the corn-stalk to his nose, and said he 'smelt the fat of a white man.' The tracker next turned to a creek leading out of the pool, and came to a stop at a place on its bank. On digging down at this point, the body of the murdered man was found.

'Quite the smartest tracker I ever had,' said a police inspector in New South Wales, reported in Mr Haydon's book, *The Trooper Police of Australia*, 'was a young gin (native woman), and she was deaf and dumb. She would follow up a track with unerring certainty. I took her

with me when engaged in searching for a boy lost in the bush in the Brewarrina district; the bush there was particularly bad, heavily timbered. After the trail had taken us for a few miles, I lost sight of it altogether, but Kitty followed it easily until we came to a place where it stopped dead. Kitty went down on her hands and knees, examining the bushes and grass minutely. Then she jumped on her pony, and, though she had nothing to guide her, turned him off sharp to the left, and about forty yards away picked up a new trail which led to the little boy asleep under a tree. Did instinct guide her to the new track?'

The tracker's methods are noted in the following true story of a lost 'jackeroo' (a 'new chum' learning station work) who got 'bushed' in the country inland from Rockhampton, Queensland. The police-officer took a couple of native troopers, and proceeded to the house of the squatter where the 'jackeroo' had been working. By daylight the troopers had brought in the missing man's horse and taken a good look at his shoes. Then, with a supply of brandy and milk, they rode away, making for the point where the riderless horse had been found grazing. They followed the back tracks of the animal, which had galloped over a big plain from a belt of forest at the far side. The boys raced along the tracks, but steadied down on entering the scrub, where so faint was the trail that they had to make an occasional cast. After following the tortuous course of the horse, they arrived at a clearing out of which he had galloped. At this spot they discovered where the rider had been thrown; the trackers pointed out where he had picked himself up and run after his steed. Failing to catch it, the 'jackeroo' consoled himself by sitting down on a log and having a pipe. After turning about in an irresolute way, the lost man took a course away from his horse's path—this fatal step leading to his undoing. Now the trackers were on the lost man's own track, and the searchers forged slowly ahead through the forest—on for many weary miles, till they found it necessary to secure their own safety by getting water and making a camp for the night. One of the boys climbed a tall tree, took the lie of the country, descended, and blazed the trunk. Quitting the trail, he rode off at a tangent, remarking, as he pointed with his chin (the blacks' customary gesture), 'Mine think water sit down there.' Sure enough, they found water; that is, they were able to scoop up with their hands about a gallon, which, though muddy, warm, and spiced with gum-leaf juice, tasted like nectar. Next morning they picked up the tracks again at the blazed tree. From signs they found that the 'jackeroo' had become confused, his course being quite wild. Suddenly the boys headed for a fringe of dark-leaved trees enclosing the channel of an old water-course. The exhausted man had tried in vain to get

water there, as the supply had dried up. The hapless 'jackeroo' was not far off. The trackers ran his tracks down the sandy bed of the channel, and announced, 'That fellow sit down here,' adding the cheerless pronouncement, 'That fellow bong' (dead). But here they were wrong; instead of being 'bong,' he was 'budgerie' (all right), though in a poor state from want of food and water. In a few weeks, in the salubrious clime of Queensland, the lost one, found by the black trackers, was quite well again.

A recently arrived Australian mail brought particulars of another instance of the black tracker coming to the rescue of his white supplanter in the ownership of the soil. In this case, as in the others given, the outcome of the natural instinct of the savage saves life where the science and industry of the white man fails entirely. The lost person was a boy, Nicholas Frousheger, four-and-a-half years old, whose home was near Charleville, Queensland. The annals of the Australian bush teem with stories of endurance. No finer instance can be given than the story of this little hero, who for seven days travelled through one hundred and twenty miles of wild bush, where the dingo, the wallaby, the morepork, furnished the child with a sense of (questionably welcome) companionship. Nicholas is the son of a wood-carter. On 10th July 1916 he wandered away from his father's dray. Unable to find his child, Mr Frousheger reported the matter to the police, who, having summoned to their aid a black tracker, began the search. The bush round Charleville is rough, stony, and barren, and there is nothing

there to satisfy hunger, and water is scarce. The tracker easily picked up the boy's foot-marks, and the whole country-side joined in the search for the lost boy. Day by day the tracks showed that the child had gone steadily ahead, on a north-east course, towards the sunrise. The first day the boy walked ten miles across a 'bore' (artesian) drain, and through two wire fences. The next day's track record showed that the boy was walking barefoot on one side of one foot, an indication of a sore foot. Each day progress was made; his only food was grass (which, on the boy's rescue, necessitated special medical treatment). By this time the mite had become very much frightened; his track showed that when he heard the searchers at his heels he hid in the bushes. It is impossible to understand the terror experienced by the poor little child in those marches by day without food and sufficient water, and those dreadful nights, with all the alarming sounds of the bush around him. He was found by the black tracker on 16th July, alive and well, strange to say, but for swollen legs. With proper care he soon recovered his health.

In former years the native trackers received the magnificent sum of two shillings a day; now they are better paid. These worthies helped to hunt down the Kelly bush-ranging gang in Victoria, and received as special pay three pounds per month each, with uniform, quarters, and rations. It will readily be seen that, with such services to the communities of the Australian states as those here narrated, the black trackers of Queensland are not overpaid.

## THE MYSTERIOUS MIASMA.

### CHAPTER V.

'YOU'RE lookin' yourself again, Miss Leila,' said the ferryman, casting off, and allowing his wherry to float out diagonally across the ebbing tide. He thrust the long sweeps into the water, and pulled watchfully and dexterously, feeling the strength of the current, and calculating to a nicety where he would land her.

'Yes; I'm quite myself, thank you, Peter,' said she, with her observant eyes fixed admiringly upon the rippling muscles of his bare, brown arms.

'What a shame it be,' returned Peter, 'to try and poison people wi' that there m'asma! Hangin' be too good for they, Miss Leila. I'd bury 'n alive,' he asserted vigorously.

'They deserve it.'

'Glad to hear 'e say so. For it bain't no healthy salt mist as comes o' the hot days from the moistiness o' the pool, Miss Leila. Some do say as it is. But I do say as it isn't. For why? We've had the mist for countless

generations, Miss Leila—for count-ness generations,' he repeated, with emphatic pauses; 'and if the mist could ha' choked anybody, 't would ha' choked fayther and me.'

'And the whole town,' added Leila.

'And the whole town,' he echoed. 'Fac' is, there wouldn't be no town. No! As I do say, the m'asma be a produc' o' the devil, so to speak, put on the market down hereaway by some sneakin' hagents o' his, 'at draw the price for it out o' the lives o' the people, killin' of 'em wholesale, Miss Leila—wholesale. Proper blood-money, I do call it. And all along o' this 'orrible war.'

'It is horrible, Peter.'

'Worse 'n 'orrible, Miss Leila, if one could only find the fittin' word for 't. They didn't fight wi' m'asma, and sich-like dev'lish contraptions, in fayther's day; no, nor in gran'-fayther's either. I've hearn 'n tell as 't were clean fightin' then. And the best men won.'

'Let us hope the best men will win now.'

'Ay, we may 'ope it. God should beat the devil, Miss Leila.'

'He should, and will.'

'Passon he do say the same wi' a rigmarole o' argifyin' 'at only a double extra magnifyin'-power glass can see into the middle o'. Sounds diff'rent, somehow, when you do say it—straighter like and more comfortin', Miss Leila. Do you remember fayther?'

'Very well indeed. He was called Peter, like you.'

'So he were, *and* gran'fayther. We be all Petera. 'Tis a proper name for a ferryman. And a ferryman were a ferryman in they days. For one I row across, fayther rowed ten. A passel o' folks must ha' crossed along of he—more 'n he could count. He were a ferryman fifty 'ears.'

'As long as that, Peter?'

'Fifty 'ears, four montha, and two days exac'ly, Miss Leila; and at the end o' the second day, when the sun were sinkin', he cried "Ahoy!" for the big ferryman, and crossed suddent to the other shore, a long sight farther away than this,' he concluded, as the wide nose of the wherry ran up the sloping sand.

'Peter's Pence is not so plentiful with you as with your father.'

'No. But folks like you, Miss Leila, do make up for't,' as she declined the change he offered her. 'Now, there's that young Swiss up to Corbie Point; he do a'ys pay liberal, and he crosses a bra' few times.' He was making the wherry secure. Leila had been waiting for an opportunity to ask him about the young Swiss, cautiously, however, lest he should think her inquisitive.

'He must enjoy a ramble over the sands,' said she.

'He do, but never very far; just up to the black cliff and back, sittin' there sometimes for a bit o' book-readin', or potterin' round after shella. A mincin' little fellow he be, Miss Leila, clippin' his words into snippets, and sayin' "Sir-r-r-r!" to me—to me,' he repeated, 'a ferryman. Why cannot he say Peter? 'Tis the Swiss lingo, I reckon, stickin' to his tongue like lollypops, sweet and sugary.'

'Is he Swiss?'

'Sure—both he and his uncle.'

'Does his uncle cross with him?'

'Lor', no! Miss Leila. This soft sand be no ground for stickin' a crutch in.' They were then mounting it, side by side, towards the ferryman's hut. Leila lingered at the door. 'And yet he do handle the gig smartly, a gig he've bought and altered the colour of—painted her a dark reddish-brown, and fitted her wi' a lug-sail and a little mizzen, tanned both of 'em to much the same colour; and he do drive a bit, townwards mostly, in Sally Basset's jingle.'

'He sails and drives?'

'Both—sails in the evenin's, and stays out late, too—line-fishin', I fancy—runnin' out into

the bay, far out, then back to the eastward, close in under the dunes, and along the slow slack water until the ebb do catch 'n, and carry 'n down to the Point again. Clever sailin', Miss Leila, sure 'nough—not every evenin', only once in a while, and bringin' home for Sally Basset many a nice string o' fish; and drivin' not every day, but just for the change of it, when the maggot do bite 'n.'

'The maggot?'

'The mood, I s'pose,' explained Peter, 'the incline-ation. I do call 'n maggots, Miss Leila. His do bite 'n for solitary drives and sailin's; mine '—and his eyes twinkled, while the wrinkles of his rough, red face were all conformable to his appreciative smile—'for many more passengers as winsome as you.'

Leila laughed outright, and said, 'I should call your maggot gallantry, Peter, if you were a younger man. Good-bye!' and she went her way to a self-invited tea-drinking with the childless widow, Sally Basset.

Sally was sympathetic and confidential. She had not seen Leila for some time, and she considered it an honour to be visited *sans cérémonie*. She regarded Leila's recovery as providential. She would have said that Dr Neville was the instrument of Providence if Leila had told her that she owed her escape from severer suffering, and possibly from death itself, to his timely intervention. And she would probably have associated the two in a manner that Leila did not desire. For, where Dr Neville was concerned, Leila was becoming abnormally sensitive.

Sally needed no prompting to talk about her lodgers. All that Leila had to do was to drop an occasional encouraging monosyllable as evidence that she was attentively listening. Soon, however, Sally's voice fell to a confidential whisper, not because any third person could overhear, but simply as a concession to the delicacy of what she had to say. Leila was startled—more than startled—incredulous, and said so.

'I cannot believe it, Sally.'

'Perhaps not, my dear. I don't blame 'e. I couldn't believe it; but I've been forced to. You cannot go against your own hearin', and your own eyesight, to say nothin' of the hinstings that a woman has. I'm fifty-six, Miss Leila, and—well, there, my dear, it be so, and you may believe it, or you may not believe it, but you cannot alter the fact.'

'What have you to go upon, Sally?'

'To go upon? Little things mostly; but puttin' 'em all together, my dear, they make a big fact that nobody can alter.'

'Are they in?'

'No, my dear—out, both of 'em, worse luck!' said Sally; but Leila thought otherwise. 'Now if *he* were in,' Sally went on, 'I'd convince 'e. For I'd ask 'n to join us. The way he do handle a tay-cup would convince 'e—almost,' she con-

ceded. Then, remembering her duties as hostess, 'See if the kettle be boilin'—do 'e mind?—while I do set the table.'

'Not at all,' said Leila, rising, as she answered the question, and stepping into the kitchen.

'There be furze in the outhouse,' Sally called after her. 'Push a bit under to bring 'n to the boil.'

Leila followed her advice. But, with the sprigs of furze half withdrawn, she straightened herself, and fixed her startled eyes upon a round, elongated package, like a huge bottle, protected by a wrapping of woven hemp, reared in the far corner. She recognised it at once. The furze was heaped around the lower part of it, but the hemp covering showed above the furze, and the neck protruded. It was a steel cylinder.

'What is that bottle-looking thing in the outhouse, Sally?' asked Leila innocently over the tea-table.

'Ballast for the boat, my dear; so they do say,' returned Sally. 'It be laid lengthwise along the keel, and the padding do make it sit easily against the curves o' the plankin'. I never see'd ballast like it afore.'

'Nor I,' said Leila. 'Where do they get it?'

'The old man do fetch it in the jingle from a cellar he've rented down to Bessow's Quay; not all of it, for sometimes he do get it out in the bay.'

'Out in the bay! It doesn't float about, Sally.'

'No. He do get it from any boat as can spare it.'

'But no other boat except his uses ballast like this.'

'None o' our boats as I do know of. Queer it be, Miss Leila—very queer. And queer, too, 'at ballast do need changin' when once it be settled in. And change it they do—frequently.'

'It is queer,' assented Leila, musing.

'Those he do fetch from the town he do shove into the outhouse, mostly under the furze; then, of an evenin'—always of an evenin'—both of 'em do drag'n down to the grotto, and lower'n over the ledge into the gig. And heavy work it be, my dear—main heavy. I cannot move 'n.'

'Under the furze? Are there others besides the one I saw?'

'Three more, my dear.'

After tea Sally took Leila down to the grotto, and on the way showed her the ruts scored by the weight of the cylinders in the soft gravel of the shaded path concealed by the overhanging hazels. The boat was beneath the ledge. Ropes were coiled in the grotto for the lowering of the cylinders. Leila, preoccupied by all she had heard and seen, only gave half an ear to Sally's further and more general conversation, and bade her an early farewell.

Leila's information enabled Dr Neville to

expedite his preparations. At his request, she visited the town the following day, and located the cellar at Bessow's Quay, an old part of the town, where at one time, previous to the construction of the harbour, the unknown Bessow had built a rough landing-place, now neglected and disused. Neville watched the opening in the black cliff. Except at high-water, it was approachable from the beach; then, however, the sea lapped it, and a boat could be floated close in. Sixty paces back from the opening, following the fracture of the rock, he tested the dunes, Day, the foreman, helping him—for he had taken Day into his confidence. There he found the charcoal. He intended sinking a shaft, and burrowing rapidly from the landward side of the cave; but everywhere the rock met them. Only a powerful explosive could have shattered a way through it. So he abandoned the idea, and decided to enter where the young fellow entered, and, if possible, take him in the act.

The police were to keep the cellar at Bessow's Quay under the strictest surveillance. The coast-guard, when the time came, were to bar the exit from the cave. The cottage on Corbie Point was to be watched by a posse of special constables. Everything was in readiness for a change of wind. For some days it had been northerly. Dr Neville surmised that, if it veered anywhere within his twelve points, another attempt would be made to release the noxious mixture. He frequently scanned the barometer. He turned his eager eyes upon the oscillating vane many times a day. The barometer fell slowly. The wind shifted westward. He warned the coast-guard to be ready instantly, on hearing from him, to close in upon the cave.

'Dare you enter the opening into the black cliff, Miss Fairley,' said he one morning, 'and go forward as far as the fracture will permit?'

'Alone?'

'The wind is veering southerly. I shall hide in the dunes, and keep an eye on the ferry. A sea-gull's cry will be the signal for you. Dare you enter?'

'Yes!'

'I am very grateful. A messenger will be waiting to carry the news to the coast-guard. I shall raise my hand to him. Then I shall follow you.'

Leila, crouching under the cliff, listened for the signal with a pounding heart. Presently, above the rush of the seas, the cry rang out, piercingly clear. She squeezed sideways through the narrow opening. For a few yards the cave was so contracted, a mere crack in the rock, that she was forced to maintain this awkward sideways movement. Then the crack widened, and the glazed and slippery footing over the rock ended in a natural step descending to a carpet of soft, fine sand. Here she could stand upright and turn herself. It was very dark. She went

forward, feeling her way with arms extended and feet moving cautiously, for fifty or sixty yards, until she could touch the walls again on either side. The sand continued, but the walls fell to at a sharp angle, and met above her head. Soon, however, they widened once more, and the fingers of her left hand came in contact with what appeared to be a wooden framework enclosing some harsh woven fabric, rounded and firm, and reared on end within it.

Passing her fingers along the framework, and still moving cautiously forward, she heard the dulled footsteps of some one following her, and the soft swish of garments brushing along the rock. She stood still, waiting, her quickened heart-beats drumming in her ears.

'I thought I should have caught you up before this,' said Dr Neville.

'I must be near the end,' answered Leila.

'Very near;' and he switched on an electric torch.

'Oh!' cried Leila, bewildered for a moment; then, her eyes recovering, she saw that they were in a small triangular chamber tapering to a point a little way beyond them.

The wooden framework was in four parts, and in each part, held upright, was a hemp-covered cylinder with a tap attached. Tubes above the taps connected the four, and opened out into a funnel under a long layer of charcoal. The charcoal was confined within an elongated case of finely meshed wire-netting.

'A neat little contrivance, Miss Fairley,' said Dr Neville.

'Ingenious and deadly,' she replied.

'We must press as closely in to the point as we can get—you first;' and he motioned her forward. Then, following, he released the catch of his electric torch, and they stood together in the dense darkness, listening for the incoming of the slim stranger.

Hours seemed to pass, but in reality they were minutes, and Leila whispered, 'Are you sure of him?'

'I saw him cross the ferry,' he whispered back.

And, before the sibilant echoes had quite died away, they heard him. He was approaching quickly, accustomed to the contractions and varying levels of the cave. He entered the chamber. Switching on an electric torch, he suddenly stood revealed to them, facing the framework stolidly, and all-unaware that any one was watching him. His eyes roved over the cylinders. Satisfied with the inspection, he lifted his eyes to the wire case enclosing the dull black mass of evenly laid charcoal. Then deliberately he stepped upon the lowest cross-piece of the framework, and steadily raised his hand towards the first of the taps.

'Frau von Kamphausen,' interposed Dr Neville softly but incisively—and he felt Miss Fairley trembling behind him, as the woman, dressed like a youth, jumped with fear—'I wouldn't do

that. It is unworthy of a daughter of Professor Ersch.'

'Who are you?' she demanded, dropping from the cross-piece and facing them, eyes distended, and the torch held searchingly out.

'Richard Edge Neville.'

'Ah!' she exclaimed, the breath whistling through her lips. 'And who is the other behind you? Your wife?'

'Not yet,' he answered calmly.

'Not yet,' she repeated, with a sigh. Leila had overcome her trembling, and the daughter of Professor Ersch her fear. To Leila's amazement, she continued wearily, 'I might have been.'

'But you preferred Kamphausen.'

'Von,' she retorted proudly.

'Von—I beg your pardon—and I claim to think that as Von Kamphausen's wife, and not as Professor Ersch's daughter, you are engaged in this detestable business of poisoning people secretly. It is not fair fighting, Frau.'

'As you please,' she replied sarcastically, referring to the distinction he had drawn between her relationships as wife and daughter. 'I am trapped, it seems, and by you, of all people, and by your wife to be. It is a fantastic *dénouement*. May I ask what your intention is?'

'Finally, to hand you over to the justice you deserve; but before then, to meet your wishes, if you have any, by requesting Miss Fairley to stay with you or to accompany you, whichever you prefer.'

'You were ever mindful of the proprieties, Dr Neville,' said she, glancing first at her attire, then past him at Leila, and saluting both of them with a mocking bow.

'I must warn you, Frau von Kamphausen,' continued Neville, preparing to leave them—for he detected no inclination on her part to go first—that the seaward exit is guarded, and there is no other.'

'There is no other,' she repeated in low, sad tones. 'It is the only way, so'—and instantly she raised her right hand. A sinister gleam ran along the barrel of her tiny revolver. Dr Neville was not quick enough to prevent her. A shot rang out, sharp, clear, awakening all the echoes of the cave; and she sank in a huddled heap upon the sand.

Leila suppressed a tendency to scream. Simultaneously with the crack of the revolver the light had gone out. Dr Neville switched on his own. Alarmed by the shot, two of the coast-guard men came hurrying in. They found the body collapsed exactly as it had fallen, and Dr Neville and Leila kneeling beside it. A slight perforation, seared around the edges, marred the fair, white temple of the victim. Instantaneous death from a perforation so slight seemed to be impossible. But the turbulent spirit had fled.

On the cottage veranda, far up on Corbie Point, Herr von Kamphausen sat with a swivelled

telescope focused upon the opening in the black cliff. He had not seen Leila enter, nor Dr Neville, for the simple reason that when they entered the telescope was focused on the ferry. From the ferry, having watched the crossing of his wife, he carefully followed her movements over the yellow sands. He saw her enter. And there he kept the telescope steadily fixed. On the disappearance of his wife within the opening he withdrew his eye from the eye-piece. Presently, slipping down the dunes, and dwarfed by the distance, he observed what appeared to be two small companies of ants. They closed in under the cliff—closed in until they met about the opening; and the telescope resolved them into men. He knew that the game was up. But, fascinated, he gazed on. Two of the men sprang within the opening. Still he gazed on. And in a little while four figures emerged, one a woman—or was there another woman? There was another form, straight and still, carried by the four; and then he knew not only that the game was up, but that his wifely confederate was dead.

He shut the telescope with a snap, reached for his crutch, and hastily left the veranda. Nimbly, more nimbly than his lameness warranted, he skipped into the shelter of the hazels, and hopped down the path. Half-way to the grotto he heard running feet behind him, and quickened his pace; but when he reached the ledge three men were waiting for him. To escape them he swerved, and stood precariously balanced for a moment on the very edge of the ledge; there, turning, he hurled his crutch at the three, slipped, and fell seventy feet sheer. His back struck the gunwale of the gig and broke it; but the splintering gunwale broke the back of its unfortunate owner, and flung his head violently between the thwarts, fracturing the skull on the bare end of a cylinder that lay beneath.

The cellar at Bessow's Quay was searched by the police. Among the useless odds and ends left there by a former tenant they found two full cylinders, which were handed over to Dr Neville. Inquiries among the fishermen elicited the fact that Von Kamphausen was occasionally seen far out, and, because of the colour of the gig, almost invisible, ostensibly line-fishing, but probably picking up from a suspicious trader or a rising submarine fresh supplies of gas. The cylinders were sometimes concealed in the cellar, whence, as opportunities presented themselves, he fetched them in the jingle, and hid them in the outhouse among the furze, and sometimes they were buried above high-water mark in the fine, dry sand immediately beneath the grotto.

Dr Neville remained another week as a paying guest at the Fairleys'. On the evening before his departure he strolled into the garden, seeking Leila, and discovered her seated in an arbour covered with a profusely flowering rambler rose, lost apparently in pensive meditation.

'May I come in?'

Her nerves had been shaken by the experiences of the past fortnight or so. She started slightly, and silently made room for him.

'Frau von Kamphausen forestalled me,' said he, seating himself, and gazing at her with his peculiarly steady gray eyes.

She understood him at once, and fenced the question that was springing to his lips. 'How did you know it was Frau von Kamphausen?'

'I did not certainly know until I saw her face in the glow of the electric torch. That confirmed my suspicion. The suspicion was an inference from the composition of the miasma. Years ago I took a chemistry course under her father, Professor Ersch, at a German university; and the mixture of poisonous gases, explosive when combined, was from a formula of his. Von Kamphausen was a fellow-student. We lodged with the professor. There was a double rivalry between us—as students and for the hand of Fräulein Ersch.'

'Then what she said was true?'

'Quite; and what I said also.'

'I learned a few unexpected things in the cave.'

'That my name, for instance, is Richard Edge Neville, and that I love you.'

'As you loved her.'

'No, Leila—as I never loved her. She, in my younger days, captivated my fancy; you, in my full manhood, have won my heart. I love you. I never said that to Fräulein Ersch. I love you. Is it not enough?'

'It is.'

THE END.

### THE MUSIC OF THE PINES.

THE fir-trees stir with the breath of Spring,  
Tossing their heads with a new-found mirth,  
While the darting sunlight searches out  
The opening fern in the soft brown earth;  
And a joyous song on the fragrant breeze  
Is borne from the depths of the swaying trees.

When soft the summer zephyrs blow,  
And gently stir the laden air,  
And scented, sun-warmed branches give  
Protection from the noonday glare,  
Low there steals on the drowsy ear  
Æolian music soft and clear.

When red amongst the sombre pines  
The rowan-berries glow,  
And mellow sunshine gently gleams,  
Though chill winds threatening blow,  
Sad is the song as the winds swish by,  
With many a shudder and mournful sigh.

When fierce and cold, with an eerie roar,  
The howling tempests roughly break,  
And dim in the screen of the drifting snow  
The storm-tossed fir-trees madly shake,  
Still on the wind as it surges along  
Are heard the deep notes of a wild battle-song.

## SEVENTH SERIES

### THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

A FEW thousands of years from now, when the human mind may have achieved a state of reason and refinement that seems beyond it for the present, an impartial student of what may be called the Great Tribal War will be curiously concerned with the ecstasies, the vagaries, the contrasts, and the general performance and achievement of woman during this period of upheaval. Of all the sudden transformations of human nature ever accomplished, the unfamiliar phenomena ever presented, he may regard these as the most attractive for consideration; and in the vast amount of material that the world explosion blew up from the depths of humanity to the surface and left there until the cleaning up of two or three generations had been done, and the conditions of a new age settled, he may find much evidence bearing upon the eternal mystery of the nature and qualities of the human female. Some may fear that in the end so many contradictions will be presented that a solution will be no nearer to those investigators among our far posterity than to ourselves. That the spice of life may retain its full flavour, it were perhaps better so for posterity; for with the mysteries solved, that which once seemed wayward, erratic, and subject to an inexplicable instinct being at last understood and almost scientifically resolved, life would again be a step the worse for knowledge. We of this Tribal War have been tearing the veil from Nature, and employing the secrets we have discovered for, alas! our own unhappiness and destruction. Let posterity be warned. It may contemplate, but it must beware of deducing. That great privilege of tranquil contemplation, which it will find so entertaining, is denied to the contemporaries of the women of the period, engaged in their truly manifold activities. They do in a measure contemplate, no doubt; but their minds are overcome and obsessed by the circumstances of the time, and their judgments are undependable; in what they think and say, as in all things of this war, there is the element of opportunism at work. The issues are so vast, the risks so great, the passions so violent, that plain justice and pure reason can rarely be attained exactly. One says and does that which will, one thinks, lead to the most advantageous results. Conscience being

especially accommodating in periods of excitement and strain, one is led to feel that what is thus done and said is right and true. For such errors, then, as are now unwittingly committed, that cool and contemplative posterity will doubtless make a fair allowance. It will perceive that it was our part in these times to act quickly, to smoothen the working of the vast machine, and not to cause any unnecessary and unwelcome trouble.

\* \* \*

Yet those future students will lay under their microscopes the precious specimens of the phenomena of human nature that will be so carefully cherished in their museums, and they will compare and wonder. Some may apprehend that among those critics there will be two schools of thought in violent controversy with each other on the point as to whether in the early stages of the Great Tribal War the women were 'splendid' or were not. One of the records preserved will reveal strikingly the fact that it was universally declared in the first year of the war, and became a commonplace, that they were so 'splendid.' It was usually stated in the interrogative form—'Aren't the women splendid?' It was the habitual remark, delivered with much impressiveness, of tea-time conversations, and it was frequently printed by the newspapers, laudably anxious to encourage and inspire. Even the most sceptical editors argued: 'Perhaps if we tell the women they are splendid, they will be so, if they are not so already, just as, when a man is declared to be brave, he becomes truly brave accordingly, and demonstrates his bravery on the first occasion.' The circumstance will be the more impressive to the future student in that it will seem to him that the women themselves were the most addicted to a statement of this discovery of their general splendour, and that in no case did a woman deny it. This is hard evidence for the student. He will discover that one of the chief ways in which women were 'splendid' in those early stages of the war was that, according to their own admission or proud declaration, they 'gave their husbands to the war,' or their sons or brothers—or all of them—as the case may have been. Nothing, he will think, could have been more splendid than such sacrifice. This student, we will sup-

pose, belongs to the more generous of the two contending schools. The other school will affect to be of superior mind and judgment, representative of the higher qualities of that advanced age. It will also affect a high sincerity and a completely unmaterial sensibility; it will pose as the higher man. Perhaps we now should call the members of such a school—could we see and know them—prigs, blighted products of an age in which blood had run dry in parched veins; but to their contemporaries these people will certainly seem possessed of fine discretion. Refusing to accept in its entirety the prevailing view of our time that the women in the first year of the war were splendid—few flattering statements being made about them subsequently—the Rationalist School, as it may call itself, will urge that the women did not really give their male folk to the war, but that the men simply went, and that what the women did afterwards varied somewhat. A number of them wept, many worked, and others occupied themselves in divers ways, and were of smart appearance always. These future Rationalists will produce statements from the London, English provincial, and Scottish newspapers to show that large crowds of those who were supposed to be ‘splendidly’ engaged in war work were actually crowding the shopping districts of the West End of the Metropolis in a way they had never been crowded before. They will produce what they may consider evidence that thousands and thousands of women who began to nurse soldiers in their first enthusiasm ceased when they found the work irksome, tedious, uninteresting; that others returned to their homes and social diversions after a short season that was signalled by the appearance of their photographs in illustrated periodicals. That this school will be malicious in its attitude and suggestions may be anticipated, and it will hardly scruple to adduce some of the cold truths and keen criticisms upon her own sex, as upon the other, of that most candid lady, the Countess of Warwick, who, when the war was young and the populace and the papers unceasingly proclaimed the glory that arose from death on the battlefield, did not hesitate to write that ‘man was not born merely for glorious death—he was born for glorious life, and in the systematic and universally condoned slaughter of man by man there is neither honour nor glory.’ In her book is deplored that strange, unwholesome, unfruitful alliance between Venus and Mars to which human nature and instinct seem to fly in every generation. Beauty and the bloody sword join forces when the trumpet sounds. Venus encourages to slaughter, stirs the war passions, with hatred among them, and is not disillusioned—as all are disillusioned in war sometime—until it is too late. Meantime, rejoicing in her Mars, she decks herself in the feminine way with warlike imitations. For example, she took to khaki uniform whenever possible. The French soldiers who

came upon occasion to Britain marvelled, for they said that in France that colour was sacred to the warrior, and no woman should ever wear it.

\* \* \*

But there will always be good rejoinders to the peevish critics. There is the official evidence that in the autumn of last year two hundred thousand British women were at work upon the land. The work of the Women's Army Auxiliary Corps, a veritable feminine army in France and at home, must be considered an amazing development. The omnipresence of woman in London especially is one of the phenomena of the war. From the kitchens, the sitting-rooms, and the modest drawing-rooms of suburbia a vast young girl population, of whose very existence we were scarce aware, has come into the town with pens and ink and other things, and is working well. We see it, as we pass by, through the windows of Government offices, with flowers on the table, sometimes a cup of tea, and commonly a cigarette. It works well, is rewarded with a salary that its fighting brother had sometimes not achieved, and often it spends it in good living and fine clothes. So that at the hours of going and coming there is to be seen in our capital now such a spruce array of young British femininity as London has not contained before. It has gathered great spirits and a queenly independence. The political leaders have been busy on behalf of these women, or on that of their elder sisters, and have obtained for them a Franchise Act which gives some millions of them who are over thirty, and therefore super-wise, the parliamentary vote. Here, indeed, is a revolution. Truly the war has worked strange wonders among the women of these islands. Many emotions are mingled in them. They mourn, yet they must rejoice. They have lost, but have gained. As with all of us just now, from statesmen to soldiers, there is hardly time to think and really understand. To-morrow it may be different.

\* \* \*

So for Britain. In France also there have been great feminine advances and achievements. In the Chamber of Deputies the other day, when a new session was being opened, the doyen deputy, on whom the honour of an opening speech is always by custom conferred, declared amid cheers that for their good work the women of France must be given the vote. The Académie Française, the temple of the forty immortals, the most august body of intellectuals in the world, has been so far purely a man's affair; and the thought of a woman member of that illustrious circle, to which Richelieu first gave recognition, would surely cause a trembling among the dust and bones of every genius who in the past used to sit under the renowned cupola and now rests in fame. Yet it is whispered that ere long the Académie may place women in some of its

vacant chairs. We believe that in unhappy Germany and Austria the women have in their own way done their best; indeed, the wives and sisters and daughters of our enemies have made sacrifices and borne well sufferings such as we have not known. Russia has produced her own feminine phenomena in the war. One of the most remarkable of the thousands and tens of thousands of wonders of this amazing war was the 'Battalion of Death,' as it was called, which the women soldiers of Russia formed last summer when the male soldiers of the country were faltering and retreating. They were in full male uniform, drilled and disciplined. They were soldiers, and, led by Vera Butchareff, they went right to the front, and fought and suffered. And elsewhere than in the lands of the belligerents, where woman-power counts as such a factor in the struggle, in the domains of the neutrals, there has been an uneasy stirring among the women. It seems that in the world upheaval all old-established order is to be changed, that reversal is to be the rule. Nature appears almost apprehensive that the system evolved through ages has led to failure, and that a counter-system must be set against it. So events and circumstances provoke the change and accomplish it. Hardly is there a land in which the feminist movement has till now made such little impression as in Spain, where an overwhelming proportion of the women are wholly illiterate. They are not slaves to their men; they are held in a good respect. The Spanish women I have seen in the north, in Castile, and in Andalusia in the south appear happy and well cared for. They love and laugh and sing. But they have few rights; they have seemed not to sigh for any. The feminist movement, at the head of which is a distinguished Spanish writer, the Condesa de Pardo Bazan, had made little headway, and has received small encouragement. And in the meantime Spain, suffering from slackness, from indecision, and want of policy and strength, has been lagging behind the nations, and seemed not to know how to take good opportunities by the hand. But now, this year, a strange thing has been happening. Spain is afflicted with shortage of food. Ships carry no corn to her ports; the Germans are sinking even these neutral vessels. Spain is hungry. Administration has been bad; the hunger has been worse than it need have been. The men murmured; they came out on strike; but still they hungered, and more than before. And then, suddenly, the women arose, and the men marvelled. Never before had the Spanish women asserted themselves. They had loved and laughed and sung, indeed, and kept their kitchens well; it was not conceived that they could do aught else. They knew nothing of politics, while every Spanish man steeped his mind in unwholesome, artificial politics that led to nothing but more politics. In no land are

politics, nearly always the feeblest, most useless, and wasteful things, so useless and artificial and extensive as in Spain. When the hunger fever became acute and profiteering was rampant, the women who worked in factories struck, those who attended homes came out into the streets, and all marched along in thousands, every day, seizing the food-supplies in shops, at the markets, and at the railway stations. In many cases, with an amazing reasonableness, they paid what they considered to be a fair price for what they took, but not the price that had been demanded. Anyhow, they seized it by force. Police and even soldiers were often powerless against them. They proceeded to the headquarters of the municipal and governmental authorities, and stated their needs and their grievances. They made processions and approached the cafés by night, demanding of all the women employees that they should come out and join them, forcing them to do so. They rioted somewhat, for these things cannot be done without rioting. These are not days of achievement by tranquillity. And at last, when permission to hold an open meeting had been denied them, they assembled in public squares, and they, who had never been suspected of having the power to speak of anything save domestic matters and affairs of love and hate, made speeches which touched the truth of things more intimately than had the speeches of their male compatriots. In its overthrow of all recognised precedent and system, there was veritably something of the nature of Bolshevism in this movement of the Spanish women. It was not merely in the capital; it was not so much in the capital as elsewhere; it was all over Spain, and it continues as I write upon it.

\* \* \*

And now at the end we come to the matter that was most in mind when these notes were begun. American women are in the war. That is a great thing, for the American woman, with the best virtues of her British sister, the charm and taste of the Parisienne, and a great strength, independence, and sense which are all her own, is a fine human creature. The first association of American women with the war on the eve of America's entry into it was not, to many minds, a very promising thing; but yet there was in it a simple tenderness and a human reason that reached beyond all war. Miss Rankin had only just been elected to the U.S.A. Congress when the vote was put as to whether America should fling herself into the struggle or not. And then this Miss Rankin, of Montana, clever, thoughtful, young, and good-looking, was asked, like others, three times if she was for or against the war, and answered, 'I want to defend my country, but I cannot vote for war.' She did not vote at all; there in the capitol of Washington she buried her face in her hands and wept. There were people in England who laughed and said

stupid things of this first woman representative in America's Parliament, not realising that here at least were a special courage and sincerity and a great human pity. It would have been so easy—so much easier—to vote for the war. Some said that here was the moral of electing women to Parliament, here the quick demonstration of the stupidity of permitting women to meddle with public affairs. But I was glad to read in the chief newspaper of France these words, written editorially: '*Mademoiselle, la France, que vous savez si farouchement résolue au combat, bien loin de vous blâmer, vous comprend, vous excuse, vous sourit et vous console.*' Since that time, her country at war, Miss Rankin has gathered strength, and has voted and worked nationally with vigour and patriotic determination. The women of America generally are showing their worth. They are the most enlightened women, and nobly they are playing their tremendous part. One day not long ago a hundred thousand American nurses marched through New York. In that alone there is some measure of the effort of the American women. One afternoon, some five years since, I sat at a window in Fifth Avenue in New York, and for an hour, in a special mood of observation and criticism, watched the people walking by, particularly the women, considered as a new type, the newest women in the world. It was a fine afternoon in late September; the glorious Indian summer of New York enwrapped us. I made some notes, freshly inspired by immediate observation and with no war prejudice to interfere, and I should like to transcribe them now. I tried to summarise or crystallise, as it were, the many girls and women who were passing by, to extract a type from many variations. There is a trace of the Briton in her, I noted; rather more of the Parisienne; but these are only traces, and the rest is just new and original, like the tall buildings and the Pennsylvania Railway station. The American seems to have come nearer to licking creation with his women than with anything else he has attempted so far. And it is wonderful how quickly the new American-born girl answers to the influences of the national type. I noticed a fine girl bending round into the Avenue from Forty-second Street. There is

no mistaking that peculiar American gait, for there is no other like it. The women and girls do not seem to trip, neither do they walk; it is difficult to describe their gait. The American girl glides; she steals along the side-walk. Yet at the same time there is a certain delicate jauntiness of carriage, a little smooth swinging of body, a certain sinuousness of motion, and all the while her head is rocking gently, and now and then it goes craning forward until the complete symphony of movement can only be described as kittenish. Many dislike the American tongue, but good American girls of training speak delightfully. They seem to have made new voices for themselves, and their deep contralto, with a touch of the guttural in it, is a rich thing in human sound. As to their dress, they wear it as few women save those of Paris can. They are out to make themselves attractive. They believe that that is one of their missions in life, as it is. They have others. By every art and wile that her keen mind and fancy can invent the American girl has advertised herself, but she has the quality of goods to offer—according to the slang expression of the country, she 'delivers the goods.' American fathers and mothers will tell you that one of the chief characteristics of their daughters is their independence, and that no man can shake it. But the men state that they do not wish to shake it. They ask why they should, when they admire it so, and it serves them so well. For if this independence be pronounced, there is an absence of the lighter frivolity on the other side. This young woman is serious, thoughtful, has a mind, and desires to be a good companion. I have been in many American homes, and I have seen her 'delivering the goods,' being the perfect companion; and I know, though some others have not suspected, one of the chief reasons why the American man so often makes such a success of himself and strides out to the light of the business day with such confidence and audacity. He also knows. The American girl has helped to make those stars and stripes. She has 'delivered the goods' all the time, and she is delivering them now in overflowing measure. Britain will know something more of American women ere the war is done.

## THE FORESTER'S GIRL

### CHAPTER XVII.

THE forester's plans for the day following his altercation with Anita on the subject of the burnt letter were destined to miscarry, and the bread for the unknown camper on Goose Lake to be left in the cupboard, for he was suddenly wakened from a heavy, unrefreshing sleep by the buzz of the telephone, and rising noiselessly, so as not to disturb his wife, he slipped

into the other room and took down the receiver. The message was from the head forester, the watcher at the lonely observation post on the highest point in the lake district, warning him of a fire he had sighted some miles distant, and bidding him go and investigate. Dawn was breaking and the cabin chilly as David hastily dressed, pausing, however, gently to pull another

quilt over the sleeping girl, looking so rounded and pretty, the child-like face on the white pillow framed in masses of soft, black hair. *His wife!* David's heart bounded at the thought; and then, with as much speed and quiet as possible, he laid the fire in readiness for her to light, and scribbled a few lines explaining his absence and telling her not to worry if he were late in returning. Having hurriedly eaten some cold food and put a few things together for his saddle-pack, he crept out of the house, and fetching a horse from the corral, was soon riding in the direction of the fire.

Several miles already lay between him and his home when Anita, suddenly conscious of the vacancy at her side, woke with a start to see her husband's place deserted, and the sun, now mounting rapidly behind the trees, darting shafts of gold through her window. With a feeling first of bewilderment, then of alarm, she sat up in bed, at the same time noticing that David's clothes were gone and that a sense of emptiness pervaded the little house.

'David!' she called. 'David! Where are you?' Then her brows knitted and her eyes grew troubled as into her confused mind rushed the remembrance of the previous evening, and of David's cross-questioning about her letter. Was he still angry? Where was he now? What did he mean when he had kissed her, saying so strangely that with *her* he was not angry? With whom, then? Oh, how silent it all seemed! 'David!' she called again, and her own voice sounded loud and strange. A sudden terror seized her, and springing out of bed, she ran into the empty kitchen. There stood the two rocking-chairs, David's and hers, side by side. Almost uncanny they appeared to the frightened girl. Then her eyes travelled towards the door, and she saw the big key hanging on its nail, but the lock undone. Had he gone out and left her? And where had he gone—and why?

A thousand wild thoughts assailed her as she stood shivering and irresolute. Then a sun-ray suddenly danced on the blackleaded stove, and she saw the door open and the fire neatly laid, while on the shining top lay a scrap of white paper. With a cry, half of relief, half of fear, Anita picked it up, and opening it, read David's message, so full of tenderness and the thought to spare her anxiety. As Anita's eyes followed the hastily written words, as her mind slowly took in her husband's unfailing thoughtfulness—the fire laid ready for her, while he himself had gone breakfastless that she might sleep; his care not to disturb her—a great wave of shamed self-reproach swept over her, and bursting into tears,

she sobbed, 'I'm not worthy of so good a husband—not worthy—not worthy!'

For now Anita recognised only too clearly that her first thought on missing her husband was not for him, but for Gavin Barrie—a haunting dread lest David had gone to seek him out and do him harm. And she, David's own wife, knew in her heart that she would willingly sacrifice him, herself, the whole world, for the sake of this one man whose whereabouts she did not know, whom she might never again see. Yet in marrying the forester Anita Lalonne had done no premeditated wrong; rather had she been caught in a swift current of circumstances, which swept her along until she found herself turning away from the ugly little corrugated iron chapel at Keyes Mills as David Hardy's wife.

Her feeling for Gavin Barrie, engendered years before by his chivalrous care for a humble, unprotected girl, she had never attempted to analyse, or contemplated the possibility that either the man or her secret worship for him might ever remotely affect her life. In all likelihood, had not her husband's unreasoning jealousy awakened in Anita an instinctive fear for Gavin's safety should ever his path again cross their own, her love for him might never have risen to the surface to disturb the tranquil acceptance of her fate, rendered tolerable by David's devotion. But now, like a prisoner at the bar, she stood arraigned before the tribunal of her own conscience, her husband's love accusing, the while her aching heart pled for her. Huddled on the bare floor, her head buried in the cushion of David's chair, Anita wrestled with herself until the autumnal sun, mounting higher and higher, flooded the forester's home, and with its warmth and glow gradually soothed his distraught young wife.

Past the window flashed a jay, gorgeous in his livery of brightest blue; while the sharp rat-tat-tat of a solitary woodpecker, breaking in upon the enveloping silence, at length warned Anita of the lateness of the hour. Hurriedly dressing, and bathing her tear-stained face from a bucket of water, which it was one of David's evening tasks to have in readiness, she began brushing her heavy hair, whose glossy blackness threw into startling relief her unwonted pallor and great, sorrowful eyes. The woe-begone reflection in the mirror recurred to her mind that first evening at the Grizzly (long, long ago it now appeared), when the light from Gavin Barrie's tent, playing upon the whiteness of her walls and of the fair desert lilies, brought such comfort to her lonely heart.

(Continued on page 225.)

## THREE SCOTTISH SAILORS.

By JAMES FERGUSON, K.C.

THE contribution made by Scotland to the achievements of the British Army is fully recognised, but her share in the services of the Royal Navy is generally supposed to be comparatively insignificant, and to correspond to the small area which the cross of St Andrew occupies in the White Ensign. Yet it was the victory won by Duncan at Camperdown, after indomitable vigil off the Texel, at the most critical moment, with mutiny rampant at the Nore, that rendered later triumphs possible; and the genius of Nelson was well supported by three Scottish admirals, Lord Keith, the Earl of Northesk, and the fiery Cochrane. There have been other gallant Scottish sailors, and it may be not without interest to recall from oblivion the names of three captains whose careers illustrate the steady work of the old navy, and who did good service in their day and generation.

All were cadets of an Aberdeenshire family, one of whose members led the brigade that stormed the height of Schellenberg and hung on to the palisades of Blenheim; while another invented the first breech-loading rifle used in the army, and his fall at King's Mountain marked the turn of the tide in the war of the American Revolution. 'The precise point,' writes Bolingbroke, 'at which the scales of power turn like that of the solstice in either tropic is imperceptible to common observation, and in one case as in the other, some progress must be made in the new direction before the change is perceived.' It is a curious coincidence that while Roosevelt and other American writers fasten upon the importance of the action at King's Mountain in their revolutionary struggle, which resulted in the loss of the old dominion, a German biographer of Lord Chatham has fixed upon an incident in the life of the first of these Scottish sailors as the fateful moment when the future of the Seven Years' War was changed, and the first definite step was taken in the conquest of the new Dominion of Canada.

Captain John Ferguson, R.N., is first recorded as taking part as lieutenant in command of the *Ursula* in a successful engagement off Ostend in 1745 with three Dunkirk privateers and seven prizes, in which three of the prizes struck to the *Ursula*. Promoted to the rank of captain, he was during the rising of 1745-46 in command of H.M.S. *Furnace* on the west coast of Scotland, and distinguished himself as the hottest presser of the chase after the fugitive Prince. He 'rendered himself so conspicuous on that station by his activity, diligence, and good conduct, that he was promoted, it is said, on the express interference and recommendation of the Duke of Cumberland,' who became godfather to his eldest

son. He was known among the northern Highlanders as the 'Black Captain,' and the Jacobite writers describe him as 'a most active emissary of the Hanoverian party,' and 'a fit tool for William the Cruel.'

In May 1746 he came to Raasay, and sent a party ashore who 'burnt Raasay's good house to ashes,' and all the houses on the island except two small villages, found all the laird's furniture and silver plate in a cave, and carried off or destroyed a large quantity of cows, horses, sheep, and goats. He seized eight hundred stand of arms at Macdonald of Barisdale's house, and about the end of June landed on Barra with some hundreds of soldiers. A little later he was off the coast of Uist, and very nearly caught the Prince. Burke relates how, as they passed by Finsbay in Harris, the fugitives espied a man-of-war under full sail, commanded by Captain Ferguson, which pursued them for three leagues, they only escaping by getting into shallow water near Roudill. A little later, shortly before the disguised Prince and Flora Macdonald left Uist, they were taking supper with Lady Clanranald on the shore, when a message came that General Campbell and Captain Ferguson were at Armadale in search of the Prince, and Lady Clanranald had to hurry home to 'be strictly examined by Ferguson.' On a third occasion the huntsman was very near his royal quarry. The boatmen were taken on their return to Uist, and Ferguson, 'having got an exact description of the gown and dress the Prince had on, pursued him to Sir Alexander Macdonald's house, and then went to Kingsburgh, where he examined Mr and Mrs Macdonald and their daughter. 'If Captain Ferguson,' exclaimed Mrs Macdonald, 'is to be my judge, then God have mercy on my soul!' On his asking why she said this, 'Why, sir,' she answered, 'the world belies you, if you be not a very cruel, hard-hearted man; and indeed I do not like to come through your hands;' to which the captain replied, 'People should not believe all that the world says.' He then put some searching questions, asked to see the rooms where Miss Macdonald and the supposed maid slept, and observed that the maid's was better than the other, which confirmed him in the belief that it was the Prince in women's clothes who had been with Miss Macdonald. On Kingsburgh's daughter saying it could not be the person he meant, as she had heard the maid ask something from Miss Macdonald in Erse, he replied, 'This confirms me more and more in my opinion, for I have often heard that a fellow went to Rome some years ago on purpose to teach the Young Pretender the Erse language.'

An interesting local tradition has been preserved as to how the captain obtained his immediate clue. Two days after the Prince left Kingsburgh, his ship cast anchor at the Crannag below the chamberlain's residence. He went ashore, and finding a dairymaid in a field, 'entered into conversation with her, as indeed he did with all with whom he came in contact.' She was asked to go on board the ship, and was treated very kindly. 'Captain Ferguson spoke Gaelic to her, and she thought him the nicest and kindest gentleman she had ever seen, saying "that she had seen Prince Charles, that he was a night at her master's house, and that his appearance pleased her much, though he did not appear to be half so kind as Captain Ferguson himself was."' This was 'the first direct proof of the Prince's motions;' and the story seems to be confirmed by a letter from Sir Alexander Macdonald to Lord President Forbes, in which he mentioned that 'the women about Kingsborough's house, being examined, discovered the Pretender to have been there.' Shortly afterwards an officer and a party of soldiers rode up to where Miss Macdonald was, and demanded her name, as they had a warrant to arrest one Flora Macdonald, a rebel lady, who was to be taken on board the *Furnace* boat, commanded by Captain Ferguson. She was twenty-two days on board this ship.

Two quaint stories of second-sight are recorded as associated with these events. In 1744 a servant of Macdonald of Scarry-Dhonil, in Benbecula, saw at no great distance 'a promiscuous heap of redcoats and Highlanders on the path to the house;' and when in 1746 Captain Ferguson of the *Furnace*, at the head of a body of troops and Argyll Militia, came to the house, the people recognised them 'really as Maculloch had seen them two years before by the second-sight.' Also in the end of the year 1744 fourteen persons saw a large vessel coming in below Kingsburgh in the dusk of the evening, and drop anchor in the entrance to Loch Snizort, a very uncommon harbour. Next morning there was no vessel there, 'and we all agreed it to be the second-sight, which was soon accomplished, for Captain Ferguson, being in search of the Young Pretender with the *Furnace* sloop of war, anchored exactly in the dusk of the evening in that unusual place.'

The activities of the crew of the *Furnace*, and the Campbell and MacLeod Militia, who co-operated with them, were not confined to the islands, for one of the Prince's followers mentions that when he resolved to join Macdonald of Morar, they arrived at Morar's bothy or hut, his house having been burned by Captain Ferguson; and similarly at Baradale they found the house burned by the captain, and the laird in a bothy. The *Scots Magazine* records that Captain Ferguson and General Campbell, with a force of sailors, marines, and Argyllshire Militia, crossed the

country to Loch Morar, and after an engagement on an island, burned a Roman Catholic chapel, when the sailors danced a hornpipe in the priest's vestments. Subsequently, after a search of three days and nights, they discovered Lord Lovat, who was hiding in the hills, captured him and his strong force, and as they marched him down to the coast the pipers of the Campbells played the Lovat March. At his trial the Attorney-General said, 'He was taken by a party sent by the duke under command of Captain Ferguson, who treated him with great humanity;' and during the time he was on the ship they had frequent conversations regarding the rebellion. 'He was asked by the captain how he could act as he had done after all the favours he had received from the Government.' He answered it was not against the king but the Ministry he had acted; that they had taken away his company; and when he was told 'it was a bad revenge to endanger his own life and fortune,' his answer was, 'Who would have thought but that they [the rebels] could have carried all before them?' Thirty-three years before, Lovat had been assisted to escape from a situation of great danger at Bois-le-Duc, in Holland, by his custodian's grand-uncle, Brigadier Ferguson.

Captain Ferguson afterwards said that he was more than once 'within an hour of catching the Prince;' and on being once asked by his relative, Mrs Ferguson of Pitfour, whether he would have despatched him if he had caught him, he replied, 'I would have preserved him as the apple of mine eye.'

For his services on the Scottish coast Captain Ferguson was on 6th October 1746 appointed to command the *Nightingale*, a new frigate just launched. In 1747 he 'again distinguished himself by the capture of a French ship of somewhat superior force called the *Dauphin Royal*, carrying twenty-two guns and one hundred and fifty men. The enemy made a very obstinate though running fight, and was not overpowered till after a contest of two hours' continuance.' In 1753 we find him commanding the *Porcupine* on the coast of Scotland, and 'very actively employed in scouring that quarter and preventing the return of the rebel chiefs.' In 1756 he was transferred to the *Solebay*, and in that year the freedom of Aberdeen was conferred on Lieutenant William Ferguson of H.M.S. *Solebay*, 'of which an honourable man, John Ferguson, is captain.' In 1758 he was captain of the *Prince of Orange*, a fourth-rate of sixty guns in the Louisburg expedition, which in 1762 was one of the Channel Fleet under Sir Edward Hawke, and was afterwards appointed to the *Firme*.

The notice of his career in Charnock's *Biographia Navalis* concludes: 'An anecdote is related of this gentleman in Entick's History, which we think it would be an act of injustice to him to suppress. The coast in the neighbourhood of Louisburg was so well fortified both

by art and nature that it was generally deemed almost an impracticability to effect a landing. The admiral took the advice of each captain separately, and, to use the historian's own words: "It coming to the turn of Captain Ferguson, an old, brave, and experienced officer, whom Mr Boscawen had requested from the Lords of the Admiralty to attend him on this service, and in whose opinion and conduct in the most trying circumstances he could place great confidence, this captain having delivered himself in the most respectful terms in regard to the opinion of his brethren, whose reasons the admiral ingenuously related to him, and disproving the arguments drawn from the danger of the service, he advised the admiral, for his own honour and the glory of his country, to exert that power with which he was invested, and not to leave it to the uncertain resolutions of a council of war, which had been so fatal at Minorca, at Rockfort, and even at Halifax, to the disgrace of all concerned, and to the extreme loss of the nation." The admiral acquiesced in the justice of the captain's observations on councils of war, resolved to call no council, but strictly to adhere to his instructions, which were to land the troops on the island of Cape Breton.'

The result of that decision is writ large on the page of history. It was Louisburg that year, Quebec the next, and Montreal the next. Upon this episode Von Raville fastens as the turning-point in the British conduct of the war. 'Now came the critical moment to which we can almost point as marking a change in the whole colonial war. . . . This was the right word at the right moment, and seemed to break the spell which had so often bound the British military power. Boscawen took the captain's advice, and the fate of Louisburg was sealed.'

Captain John Ferguson's arms were recorded in the Lyon Register of 28th January 1757 as *Argent, a ship of war under full sail proper, and on a chief azur, three Boarsheads couped or. Crest, A dexter hand grasping a broadsword proper; motto, Pro Rege et patria.* He married Lydia Van Cumber, and on retirement settled at Chigwell, in Essex, where he died on 2nd March 1767, leaving two sons, William, a captain in the 24th Foot, and John, a captain in the navy, who died in Egypt in 1803.

The career of the second of the three cousins, while not exhibiting participation in the romantic events of 'the Forty-five,' or a history-making incident like that of Louisburg, illustrates the strenuous and continuous service of the old navy to which Britain owes so much. Captain James Ferguson, R.N., first went to sea in the *Leopard*, and became lieutenant in 1756, and post-captain in 1763, being appointed to the *Romney*, the flagship of Lord Colville, on the American station. In 1776 he went out with a convoy in command of the *Brune* frigate of thirty-two guns. In the frequent attacks on York Island

he was 'very particularly and distinguishedly employed,' and Lord Howe wrote in despatches: 'Particular notice is due to the ability displayed in the direction of many difficult and fatiguing services which Captain Ferguson of the *Brune* was charged with.' In March 1777 he commanded the naval part of a successful expedition sent up the North River to demolish an American magazine at Peek's Hill. He afterwards, in command of the *Venus* of thirty-six guns, distinguished himself at the action in April 1780 between Sir George Rodney and the Comte de Guichen. 'When night came on,' wrote Rodney, 'I formed the fleet in line of battle ahead, and ordered the *Venus* and *Greyhound* frigates to keep between his Majesty's and the enemy's fleets, which was admirably well attended to by that good and veteran officer, Captain Ferguson.' And his relatives in Edinburgh were proud to learn from one of his officers that 'Admiral Rodney paid him a very high compliment for his behaviour in the last action.' He was immediately appointed to the *Intrepid*, and afterwards to the *Terrible*, of seventy-four guns, was present at the battle with the Comte de Grasse off Martinique, and in command of the *Egmont* accompanied Lord Howe to Gibraltar in 1782. He was present at the encounter with the combined fleets, and in January 1784 was appointed lieutenant-governor of Greenwich Hospital, a post which he held till his death in 1793. 'This promotion,' the *Scots Magazine* noted, 'was granted him spontaneously without solicitation;' and the notice in the *Biographia Navalis* concludes with the quaint observation: 'This gentleman among some eccentricities possessed also many excellent qualities, and the shades of the former were not in any degree capable of obscuring the brilliancy of the latter.'

The third of our three sailors, Captain William Ferguson, R.N., was a native of Peterhead. He served on the Mediterranean station, and in 1756 received the freedom of Aberdeen as lieutenant of his relative Captain John Ferguson's ship the *Solebay*, and that of Montrose as commander of the *Prince of Wales*. But marrying a lady of strong Jacobite convictions, Miss Isabella Arbuthnot, who had seen her brother, a young midshipman—who had torn off his black cockade and joined the Highland army on being asked on the pier of Leith, 'What would your father say if he saw you wearing that cockade?'—sail into exile after concealing him for some time dressed as a maid-servant, the boy having found his way across country to Peterhead from the field of Culloden, and the lady insisting on his leaving the service of King George, he commanded for some time an armed merchant vessel, receiving the freedom of Dundee as Mr William Ferguson in 1759. On the death of Prince Charles he re-entered the Royal Navy, and after his final retirement was, in the days of the great war in 1795, commandant of the Peterhead

Artillery Volunteers, and on one occasion laid the guns of the local battery, and beat off a French privateer which threatened the town. He died the year after Trafalgar, at the age of eighty-nine; and his descendants told how one morning, tall and perfectly erect, the old man walked into his daughter's house, and said, 'Jeanie, we have won a glorious victory, but—Nelson's dead,' while the tears ran down his face.

Northern waters have again become the scene of naval action—as we write the guns are sounding on the Firth—and Scotsmen are realising the work of the British Navy in a way they have never done since Waterloo. There is all the more reason, therefore, for recalling their share, an honourable though a minor one, in its achievements of the past, which is greater than is popularly supposed.

## MAHOMED AFZUL, SUBAH DAR.

By C. G. NURSE.

'GOOD-NIGHT, colonel,' said my second in command. 'We will meet in the morning, as arranged.'

'All right,' I replied. 'I shall be there by half-past six.'

I had arrived at Jabalpur, to take over command of my new regiment, only on the afternoon of the same day, and had dined at mess for the first time. The exigencies of the service in the Indian Army, to which I belonged, often require the transfer of officers from one regiment to another in order to equalise promotion. This usually runs in the 'link' of three regiments, composed of men of the same classes, so that an officer transferred to another regiment generally finds himself among men of the classes to which he is accustomed. Occasionally, as in my case, promotion is given outside the 'link,' but in such instances care is necessary in order to ensure that officers so promoted may be fully in touch with the habits and customs of the majority of the men in their new regiment.

Most of the regiments of the Indian Army are formed of 'class companies,' and the — Punjabis, which I had been appointed to command, consisted of four companies of Punjabi Mussulmans, two of Sikhs, and two of Pathans. The last-mentioned, of course, come from the north-west frontier, that no man's land of feuds and forays bordering Afghanistan. I had served for a good many years among Sikhs and Punjabi Mussulmans; but, though I had seen something of Pathans on the frontier, I had never actually commanded men of this class.

The senior major, my second in command, was a keen soldier, and impressed me very favourably. Of medium height, but with enormous chest development, he had been in his youth a football 'international.' He had served some twenty years in the regiment, but at the time when the vacancy in the command occurred he had scarcely sufficient seniority to entitle him to promotion. Having entered the army from one of the universities, however, he was only a little younger than myself, as I had passed through Sandhurst at an early age. The situation, therefore, was a delicate one, and demanded considerable tact on my part.

April was well advanced, and the heat necessitated early hours for all parades and duties. On the following morning the adjutant accompanied me to the 'lines' at the time fixed, and here we met the major, as arranged. The British officers I had, of course, met at mess on the previous evening, and the first work of the morning was, therefore, the introduction of the native officers to their new commanding officer. Indians are great sticklers for etiquette, but as I had served with Indian troops for well over twenty years, I had no fear of offending their susceptibilities. The regimental office was a fairly spacious building under the shade of a huge banian-tree, and here chairs were placed, and the native officers were introduced in order of seniority.

It may be mentioned, *en parenthese*, that it is the correct procedure to shake hands with a native officer, after acknowledging his salute, and to allow him to be seated on the occasion of an interview. To generals and officers of superior rank a native officer presents the hilt of his sword to be touched, as a sign of his fealty. Men of a rank lower than native officer salute, and remain standing at attention, when they come before a British officer.

The subahdar major, the senior native officer, was, of course, the first to be introduced. He proved to be a Punjabi Mussulman of exceptionally good class, well educated, and a considerable landowner. I subsequently found him a tower of strength. He had never served in the ranks, as is usual with the majority of native officers of the Indian Army, but had received a direct commission, and had consequently reached his present rank at an unusually early age. I spent a considerable time talking to him, as became his rank and position. (He fell, fighting, at the head of his men, in the present war.)

The Sikh and Punjabi Mussulman native officers belonged to types that I knew well. The senior Pathan native officer was somewhat disappointing. Below middle height, with very little of the swagger usual among Pathans, he had a foxy expression, which, as I afterwards ascertained, did not belie his character.

The other Pathan subahdar, Mahomed Afzul, was of an entirely different type, and I was much

struck by his unusual appearance. Of medium height, but broadly built, he might have been at the time about thirty-five years of age, though perhaps, owing to his quiet and self-contained manners, he appeared older. But what made him so remarkable among his *confrères* were his blue eyes and fair hair and complexion. He might easily, judging from his looks, have passed for a Scandinavian; in fact, his hair and complexion were fairer than those of most of the British officers. Blue eyes are not uncommon among Pathans, but I had never before seen one who might have been mistaken for a native of northern Europe. As I was unable to talk Pushtu, I asked him if he could speak Persian, which is much used among educated Pathans. He replied in the negative, and we carried on our conversation in Hindustani, which he spoke fairly well, though with a very noticeable accent. Pathans who join our native army as recruits frequently do not know a word of Hindustani, but they soon pick up a working acquaintance with the language. On this occasion my conversation with Mahomed Afzul did not last very long, as I had a number of other native officers to see, and plenty of work awaiting me. I formed, however, a favourable impression of him, which subsequent acquaintance did much to confirm.

During the months that followed I found plenty of employment, as I had to get into touch with the system of a new regiment, and make myself acquainted with the character and capacities of the various officers, besides carrying on the ordinary routine work. Every new commanding officer of a regiment finds something that might be improved, but if he is wise he will only very gradually introduce changes in old-established regimental customs. I was not unmindful of this, and in a short time I was on excellent terms with all my officers.

I found that Mahomed Afzul quite came up to my first impression of him, as he proved to be strong and reliable, with great influence over his men. Pathans are never easy to manage and discipline, but his company was kept in good order. Although usually a man of few words, he would on occasion express himself forcibly in Pushtu to the men under his command. I heard unofficially that if any of the *jawans* (literally, young men, but used colloquially in a regiment for the men in the ranks) of his company showed signs of disobedience, he would not hesitate to take a couple of them by the scruff of the neck, and knock their heads together. His business was to keep his men well in hand, and so long as nothing in his methods came under my notice officially, I had no reason to interfere.

After I had been for a few months in command of the regiment, an incident occurred which gave me considerable trouble and anxiety. One night a rifle disappeared from the guard-room, and for some days I was quite unable to

trace it or to discover the culprit. Now, the loss of a rifle in peace-time is a very serious matter, as it involves all sorts of telegrams and reports, besides a fine of five hundred rupees from the company concerned, so I was most anxious to get to the bottom of the matter. Suspicion pointed to Pathans, as the value of a modern rifle beyond the frontier is usually calculated by its weight in rupees. Mahomed Afzul gave me valuable assistance in the matter, and some useful hints, and in the end the efforts of my personal orderly, who proved himself quite a native Sherlock Holmes, led to the recovery of the rifle and the conviction of the thief, who proved to be a discharged Pathan sepoy. The subahdar major hated Pathans, though they were, of course, his co-religionists, and frequently quoted the well-known saying, '*Pathan be iman*' (faithless or untrustworthy). However, he grudgingly admitted that Mahomed Afzul was a decent sort of man, and better than the majority of his race. Most of the native officers and all the British officers liked him, and as he was quite efficient at his work, I was able, later on, when a vacancy occurred, to promote him to the higher rate of pay of his rank.

One day at the beginning of the hot weather, after I had been about a year in command, I was on the point of leaving my house for my evening exercise, when my servant announced that a subahdar was in the veranda, and wanted to see me. On going outside I found Mahomed Afzul, who asked me to forgive him for coming direct to me, as the matter in question was of some urgency. It may be mentioned that in a native regiment only the subahdar major has the right of approaching the colonel directly. Other native officers should apply to their double company commander. However, I did not care to send him away without giving him an opportunity of explaining matters, so I had a chair placed for him, and asked him what I could do.

'Sahib,' he said, 'I want leave to go to my home.'

'This is very sudden, subahdar sahib,' I replied. 'Have you seen your captain sahib about it?'

'No, *huzur*; the matter is most urgent, and I came to your honour first, though I know it is not according to *dastur* [custom].'

'How much leave do you want?' I asked.

'My country is a long way off,' he replied. 'I have to travel for several days in the *rail-ghari*, and then, when I reach the frontier, I cannot go by the direct route, so it will take me about ten days to get to my home. I would request, by your honour's favour, that I may be granted three months' leave, as my domestic affairs require attention.'

I explained to him that others also wanted leave, and therefore I could only allow him two months, which was probably all he expected. I then asked him when he wished to go.

'To-night, sahib,' he replied. 'I must go before any news reaches my country that I am coming; otherwise I may never reach home. I have many enemies, and if they know I am coming, they will be lying in wait for me.'

I knew something of the blood-feuds among the trans-frontier tribes, and, moreover, I had heard of his being concerned in more than one affair of honour, as understood by his fellow-tribesmen. So I gave him a note to his double company commander to explain matters, and stating that I had granted him two months' leave. Then, not wishing to dismiss him abruptly, I sat talking to him for a few minutes. A native always likes one to show some interest in his private affairs, provided that no direct mention is made of his wife. I therefore asked him if he had any children.

'No, sahib,' he replied. 'I have two houses' (that is, two wives), 'but God has punished me for my sins by not granting me any children.'

'What sins especially?' I inquired.

'I have killed seven men in blood-feuds,' he said. 'That is why I shall find it so difficult to reach my home in safety.'

'Well, good-bye, and a safe return,' I said, rising to give him his *rukhsat* (permission to depart). 'You are still young and strong; there is plenty of time for sons to be born.'

'May God so ordain it!' he said fervently. 'It is my one desire to have a son, who may avenge me in case I fall at the hands of one of my enemies. *Mihrbani rakhsa*, sahib' (literally, 'Keep kindness,' the usual parting formula from an inferior in rank).

The regiment had now settled down to the customary hot-weather routine, and a large number of men were absent on leave or furlough. The frontier had seemed quiet, when suddenly some of the tribes got out of hand, and an expedition had to be organised at short notice to deal with the situation. My regiment was so far from the scene of the disturbance that it seemed most unlikely that it would affect us in any way. I had obtained some months' leave to England, my passage had been booked, and my heavy luggage despatched to Bombay. I was actually on the platform of the railway station with a view to my departure, when a telegram to the following effect was delivered to me:

'Your regiment will proceed to Nowshera for garrison duty, to replace the — Regiment, ordered on field service. Detailed instructions will follow.'

This placed me in a situation of great difficulty. Had we been under orders for field service no question as to my duty would have arisen, and I should at once have thrown up my leave. But garrison duty was another matter. I had only a few minutes to decide on my action before the train started. To lose the train meant to miss my boat, with the result that I

should probably be unable to obtain another berth, owing to the large number of passengers at this season of the year. The general commanding the district was absent on inspection duty; and even if he had been at headquarters, there was no time to refer the matter to him. So I decided to wire to him, asking for his advice as to whether I should proceed on leave or return at once from Bombay and go with my regiment. I just managed to get off the telegram before the train started, and asked him to wire reply to Bombay. On arrival at that port I received his wire, which was to the effect that in his opinion I should return, and go with my regiment. This, of course, settled the matter, and I took the first train back to Jabalpur, to find on arrival that the regiment was to leave early next morning by special train. The arrangements for the departure of the regiment had already been made, and I spent most of the night in sorting out and packing my kit.

I may mention here an incident which shows how officers have at times to suffer pecuniarily from the error of a subordinate. During my three days' absence the second in command and adjutant had made all the arrangements for the departure of the regiment. But owing to want of clearness in the wording of an order, field-service clothing was issued without proper authority. This resulted, more than a year later, in my having to pay to Government the sum of thirty-three pounds, on the ground that I, as commanding officer, was responsible for the error.

On reaching the Punjab, during the course of our journey, we began to pass through a part of the country where a good many of our men lived. Telegrams had been sent them to join at Nowshera, but many, having by some means ascertained when we were passing through the stations nearest their homes, joined us *en route*. We found at almost every station groups of our men and their relatives. Old men and women, fathers and mothers of our *jawans*, would make their way to the officers' carriage, bringing presents of fruit, vegetables, eggs, and fowls. The greeting we received was most gratifying, and by the time we had reached our destination we had considerably added to our numbers.

On arrival at Nowshera we found that quite a number of our men had arrived, having received the telegrams recalling them from leave. Some of them were trans-frontier Pathans, who lived far beyond the range of a telegraph-office, but had received the notice of recall sent through the political officer. Others arrived daily, and in a short time we had almost our full complement. The few men who had failed to join were, almost without exception, trans-frontier Pathans, who in many cases had found themselves unable to get back owing to the disturbed state of the country. Subahdar Mahomed Afzul

was among those who had not reported themselves, and as he did not arrive for two or three weeks, I began to fear that he might have been involved in the fighting, or fallen a victim to one of his enemies. One evening, however, he duly reported himself at my quarters.

'Well, subahdar sahib,' I said, laughing, 'I began to think that you had deserted, and were fighting against us.'

'Huzur,' he replied, 'how should I do such a thing, having eaten the salt of the Sirkar for so long!'

'How are things in your country?' I inquired.

'When I arrived at my home,' he replied, 'all was quiet, and I was engaged in building a tower near my house. But before the tower was finished troubles began, and some of my own tribe were implicated. One morning a party of the enemy, consisting of men of several tribes, came to my village, and called on us to assist them in attacking the Swat Bridge. I refused to join them, saying that the arm of the British Sirkar was long; but some men from my village went with them.'

'Did they molest you in any way?' I inquired.

'They did not dare to touch me personally,' said the subahdar. 'One of my wives is the daughter of the Khan of —, and the other a sister of the chief of —, and the man who killed me would find too many enemies to hope to live long. But they knocked down my tower, which had cost a lot of money.'

'How long did they stay in your neighbourhood?' I inquired.

'Two or three days; and then they went on towards the Swat Bridge.'

'But they never reached it,' I remarked, knowing that the move in this direction had failed.

'No; they fell out on the way, and there was some fighting, in which two of my uncles were killed,' said the subahdar, laughing heartily.

I hardly think, judging from his manner, that he was on the best of terms with some of his relations. 'And how did you get here?' I inquired.

'I could not get through by the nearest route,' he replied, 'so I made my way through the hills to the British force, and reported myself to the

general sahib. He kept me there for a week, as I was able to give him some useful information. Then he sent me here to rejoin the regiment.'

'I am glad to have you back,' I said. 'Most of your *jawans* have rejoined, and I expect that the others will soon turn up.'

'But, sahib, are we not for the fighting force?' he asked.

'I am afraid not,' I said; 'at any rate, for the present. Do you want to be in it, fighting against your own relatives?'

'I don't care a bit, *huzur*,' he said, 'whether they are my own relations or not. There are a good many of my enemies there too; and, anyhow, I should like to be in the fighting.'

The fates, however, were against us, and eventually, after some months of garrison duty, we were sent back to Jabalpur when the expedition returned. From here I took leave to England, and the last I saw of Subahdar Mahomed Afzul was when he and other officers assembled at the railway station to wish me *bon voyage*.

As my health showed signs of failing, I did not return to India, but retired at the end of my leave.

I heard subsequently that among the first lot of Pathan recruits enlisted after my departure were several men who had been recently fighting against us, one of whom had been three times wounded.

When the present war broke out, except for an occasional letter from one of my former brother-officers, I had almost lost touch with the regiment. However, I was interested to learn that, after serving for some time in Egypt, my old corps was transferred to another front. It sustained heavy losses in one of the big actions, and in the roll of honour, together with the names of a number of my former comrades-in-arms, I read the following: 'Killed, Mahomed Afzul, Subahdar, Indian Infantry.' A chance meeting at a French port with one of my former subalterns, now a major, enabled me to know that Mahomed Afzul fell gallantly leading his company. My friend was, however, unable to inform me whether his desire to have a son to carry on his vendettas had been realised or not.

## THE MONTH: SCIENCE AND ARTS.

### FLYING THE ATLANTIC.

SINCE this fascinating problem was touched upon in these columns in March a French aviator, Jean Navarre, has announced his intention to fly from the south-western point of Ireland to Newfoundland, a distance of somewhat under two thousand miles. According to *The Motor*, Navarre, before his discharge from

the army for certain youthful indiscretions, was the best aviator that France had possessed. For the Atlantic flight he favours a biplane of the Handley-Page, Gotha, or Caproni type, with a speed of about ninety miles an hour. The machine is to be fitted with four engines of three hundred horse-power each, and the crew is to consist of three men, each capable of piloting the aeroplane or running the engine.

Under favourable weather conditions the flight is estimated to take thirty hours. Each member of the crew would have a spell of piloting for five hours, followed by two and a half hours looking after the engine, and a rest of seven and a half hours. An enormous quantity of fuel will have to be carried, and as it is used up during the voyage the machine will become substantially lighter. This feature is to be taken advantage of by shutting off one engine at the end of the first ten hours, a second engine being closed down at the end of a further like period. The original speed will, however, be maintained, in spite of the reduced power, owing to the great reduction in weight caused by the consumption of fuel. The weight of the machine, with fuel and stores, at the beginning of the voyage is estimated at twelve tons. Another aspirant for the honour of accomplishing the first flight across the Atlantic is no less a person than Signor Caproni, the noted Italian designer and maker of aeroplanes. He will, of course, make the attempt in one of his own machines, probably similar to that described in this column in March.

#### WAX FROM SUGAR.

The process of refining raw sugar includes dissolution in water, followed by filtration through cloth to take out suspended impurities. In many refineries the filtration is effected by filter-presses, consisting of series of plates and cloths through which the liquor is squeezed by hydraulic pressure, leaving a sediment in the form of cakes. Until recently these have been used for fertilising purposes without further treatment. A Dutch chemist has now invented a process whereby wax, having all the qualities of beeswax, can be extracted from these cakes, and this is being done in the cane-sugar factories of Natal. The wax has already been exported to London, and it is being used by boot manufacturers and others in South Africa. This development will no doubt extend to the West Indies, as the demand for wax should easily absorb any probable production from sugar-factories all over the world.

#### POTASH FROM SALT LAKES.

The importance of potash as a fertiliser was emphasised here in November, when a new source of supply from blast-furnaces was referred to. Potash is also badly needed in the United States, and the consequently enhanced price has rendered commercially successful methods of obtaining it that could only have resulted in a loss before the war. Among these is the evaporation of brine from the salt lakes in Nebraska, in which 25 per cent. of the solid matter in suspension has proved to be potash. According to *The Engineer*, the water in many of the lakes is so caustic as to take the skin off the hand if dipped into it. The brine is pumped

through pipe lines to evaporating and treating works, which in some cases are as much as twenty-five miles distant. Continuity of supply is secured by pumping fresh water into the lakes, where it takes up the salts from the soil. Substantial profits are made from this industry, as the products sell for fifteenpence a pound, while the cost of manufacture is said to be only twopence.

#### A CONVEYER FOR MOTOR-CARS.

When the various parts of a motor-car are put together, or 'assembled,' as it is called in factory parlance, the work of attaching the parts under the chassis is very irksome and slow, even though the car be run over a pit, as the operators have to be continually reaching up over their heads. At a factory in Detroit this difficulty has been overcome by building the chassis upside-down; then, when all the underneath parts have been fixed and adjusted, the car is run under an immense four-sided frame, one corner of which is attached to the front of the car, while a circular track supports the back-wheels. The frame is then revolved by an electric motor, and the car is carried upwards until it becomes vertical, at which point, or just beyond it, the back-wheels leave the circular track and come to rest on the frame. Finally the frame, which is really a conveyer, is further revolved until it comes to rest exactly level with the floor above, and the car, now right way up, is run off for the reception of the remaining parts and body.

#### A NEW METHOD OF PRESERVING PERISHABLE FOODS.

As is well known, perishable foods can be preserved by storing them in cold chambers, where the destructive micro-organisms are either killed or maintained in a state of suspended animation. Similar results can be obtained with certain gases inimical to the life of the microbes of putrefaction. A gas system invented by a Parsee resident in London, Mr S. A. Kapadia, M.D., was recently described in *The Times*. According to his method the storage chambers are filled with a mixture of nitrogen and carbon dioxide, from which very satisfactory results have been obtained. Australian apples stored in this gas for weeks, under the observation of fruit salesmen from Covent Garden, showed no sign of deterioration, while partially rotten apples purposely placed in the middle of the batch had not contaminated the adjacent fruit. Equally good results were obtained with raspberries stored for a fortnight, while fish and eggs have been kept quite fresh for many weeks.

#### PAPER LIFEBOATS, SAND-BAGS, AND AIR-CUSHIONS.

Japanese papers have always been noted for their tough qualities, one of the strongest being produced from the fibre of the mulberry-tree.

This paper is now made both waterproof and airproof by a chemical process invented by a rear-admiral of the Japanese Navy, who has adapted the material to the construction of collapsible lifeboats. Jointing is effected by a special cement, that is said to have greater strength than the paper itself, though the joints are only one-eighth of an inch wide. This cement is also used to form various thicknesses of the material by sticking together a number of layers. Sand-bags made of this paper, while quite as strong as canvas bags, have the additional advantage of being waterproof. It is also said to be suitable for air-cushions, the inner tubes of pneumatic tires, bladders for footballs, and bags for flour, cement, and other materials of a powdery nature. According to the *Scientific American*, books bound in this paper are more durable than leather-bound ones, while it forms a good substitute for zinc as a lining for packing-cases.

#### A SIMPLE STOVE WHICH BURNS SAWDUST.

Where sawdust is procurable at a low price, it may be used in preference to coal for cooking and heating in the simple stove described below. The stove consists of a round box, made from sheet-iron, with a diameter and a depth of about eight inches. A ring of holes is punched round the side close to the top, and three iron brackets are riveted inside between the holes so as to support a kettle or a saucepan. A piece of wood, about two inches in diameter at one end and tapering to one and a quarter inches at the other, is fixed in the middle of the box with the small end downwards. Another piece of wood, one and a quarter inches in diameter, is pushed through a hole in the lower part of the side of the box until it comes in contact with the bottom end of the first piece, the end of the second piece being hollowed out so as to fit round the upright piece. The box is now filled with sawdust, which is rammed down so tightly that the pieces of wood can be withdrawn without any danger of particles of sawdust breaking away from the mass and filling up the spaces thus left vacant. In this way a vertical hole is left, with a horizontal hole meeting it at the bottom. To light the stove, a small amount of paraffin is poured down the vertical hole, at the bottom of which it is lit by a taper inserted through the horizontal hole. This stove, according to Mr James A. Carter in the *Popular Science Monthly*, will burn from three to six hours, giving off a steady heat without flaring up.

#### STATE-AIDED DEVELOPMENTS IN AGRICULTURE AND FISHERIES.

The seventh report of the Development Commissioners upon their work during the year ending 31st March 1917 contains some interesting matter, more especially in connection with certain investigations relating to agriculture.

Among the many items dealing with grants for various purposes is one referring to a sum of three thousand two hundred pounds allotted to the Board of Agriculture and Fisheries for establishing three hundred centres in England and Wales from which reliable chicken-producing eggs were to be distributed, while twenty stations were to be established for the distribution of day-old chicks. The British Flax and Hemp Growers' Society was encouraged by two grants aggregating nearly eleven thousand pounds, to be devoted to experiments with a view to finding out whether flax can be profitably grown in this country; and a grant of twelve hundred pounds was made to the British Tobacco-Growers' Society for a corresponding purpose. Incidentally it is stated that the latter society was able to make agreements in 1915-16 with the growers to grow tobacco at a fixed price, and at their own risk. The importance of the sugar-beet industry is fully realised by the Commissioners, who have recommended a loan of one hundred and twenty-five thousand pounds for the purchase of the Kelham estate in Nottinghamshire, where sugar-beet is to be grown, and a factory established for manufacturing the sugar. In view of the present shortage of food, one of the most important grants is that of fifty thousand pounds to the Board of Agriculture and Fisheries for installing motors in fishing-boats; while a gift of two thousand pounds was made to the Cornwall Sea Fisheries Committee for a similar purpose. Grants were also made for encouraging the breeding of horses and other live-stock, the use of electricity in the growth of crops, and the development of technical training in agriculture and fisheries.

#### AN INGENIOUS ITALIAN LIFEBELT.

The extra risks to which those who travel by sea are exposed owing to submarine warfare have directed special attention to lifebelts, and several new types have been invented. Among these is a collapsible belt which can be inflated in a few seconds by chemical action. Every one is familiar with the lifebelt or collar which has to be blown out by the wearer. This plan is not entirely satisfactory, however, as when a torpedo strikes a vessel, persons on deck are liable to be precipitated into the water by the force of the explosion, and under these circumstances no breath is available for inflating the lifebelt. In the new type referred to, which has been adopted by the Italian naval and military authorities, two adjacent bags on each side of the belt contain small quantities of water mixed with sodium carbonate and tartaric acid respectively. When it is desired to inflate the belt the valves between the two bags on each side are opened by pulling small strings, and the chemical action resulting from the mingling of the two solutions produces large volumes of gas, which fills the four bags making up the belt.

Another device for opening the valve depends upon the fact that the substance which holds the valves closed is dissolved by the action of sea-water. Before inflation the belt is perfectly flat, and can be worn under the coat without inconvenience. These lifebelts are being issued to Italian sailors and soldiers passing through the danger-zone.

#### THE WORLD'S WHEAT-SUPPLY.

Owing to the increasing dependence upon wheat as a food by the inhabitants of the world, we are approaching a time when all the available land suitable for the growing of wheat will be under cultivation. Moreover, the increasing demands cannot even be met by nitrogenous manures for increasing the yield per acre, as the existing supplies of these fertilisers will have become exhausted. This prospective difficulty is dealt with in the *Wheat Problem* by Sir William Crookes, recently reviewed in *Nature*. Originally Sir William's presidential address to the British Association in 1898, and afterwards printed in book form, the *Wheat Problem* has already run through two editions. In the present edition, the statistical information is brought up to date in an additional chapter by Sir R. H. Rew, and the book contains an introduction by Lord Rhondda. Apart from the production of nitrogenous manures from the atmosphere, the increase of the yield per acre is, according to the distinguished author, a laboratory problem. Among directions in which improvements may be effected, reference is made to the better utilisation of farm-yard manure, the elimination of fungoid diseases, and the selection of varieties of seed which give the highest proportion of grain to straw. Allusion is also made to the fact that Germany has been able to keep up her supplies of manure and explosives during the war by the production of nitrogen from the atmosphere.

#### THE PREVENTION OF STREET ACCIDENTS.

One would imagine that in London, with its dense traffic and narrow, winding streets, the problem of preventing accidents would be more carefully studied than in any other city in the world. Yet the only scientific attempts to obtain a satisfactory solution have been made in America. A very careful study of street accidents, with a view to their elimination, has been made at St Louis under the direction of Mr Charles M. Talbert, of the Board of Public Service. As a result, several novel devices have been adopted, among them being the illumination of policemen on point duty by overhead search-lights, the officers being rendered still more conspicuous by the white costume which they wear. According to the *Scientific American*, half-a-dozen search-lights of this description are now in use at dangerous corners, and accidents to policemen on point duty

have been greatly reduced. Another interesting novelty is a street box for testing the head-lights of motor-cars. Light from the lamps of the car to be tested passes through a slot in the front of the box, and falls upon a screen, lit up by an electric lamp of standard brilliancy. If the light from the car lamp exactly balances that from the electric lamp the car head-lights are passed as being correct, and the owner is given a card upon which this fact is recorded. It is hoped, in co-operation with other cities, to fix upon a standard for car head-lights which will be generally adopted.

#### FLAX-GROWING IN GREAT BRITAIN.

Although extensively cultivated at one time both for its fibre and its seed (generally known as linseed), practically no flax has been grown in Scotland, and very little in England, during the last thirty years. The amount of linen urgently required for aeroplanes and other military purposes is, however, now so great that an appeal is being made by the Board of Agriculture and Fisheries to the farmers in certain districts to devote a portion of their land to the growth of flax during the coming season. The county of Fife, for example, is being asked to set aside an aggregate area of two thousand acres for this purpose. Any soil that is neither very heavy nor very light is suitable, and there is no danger of the flax being destroyed by either rabbits or wireworms. Farmers undertaking the experiment are offered free seed, and a fixed price of eight pounds ten shillings per ton for their crop, with a minimum payment of fourteen pounds per acre. They are also promised a supply of labour during the operations of weeding and harvesting when this is found to be necessary, and a mileage rate of one shilling and sixpence per ton where the crop has to be hauled a distance greater than three miles. It is sincerely to be hoped that a sufficient number of enterprising and patriotic farmers will be found ready to co-operate with the Board in carrying out this programme, and thus assist in meeting an important requirement for the effective conduct of the war.

#### AN ALARM-WATCH.

The alarm-clock has long been regarded as indispensable in many households, and there has now been put on the market an alarm-watch which bids fair to become quite as indispensable to the busy man of many engagements. The alarm can be set to go off at any moment, thus forcibly reminding the wearer of an approaching appointment. Even should the ringing of the alarm be drowned by competing noises, its vibrations are so powerful that they are felt in the pocket, and the wearer's memory is effectively jogged. The case of the watch is of gun-metal, and it is exceedingly neat and compact in appearance. There are two separate and distinct

mainsprings, this feature enabling the watch to run its full time whether the alarm is used or not. The alarm-hand works independently on a special dial, and can be set without opening the watch. The 'crown' or winding-knob is so constructed that it does not rotate while the alarm is in action (as does the corresponding piece of mechanism in the alarm-clock); hence the ringing cannot be stopped by reason of the 'crown' being caught in the pocket. This new timekeeper is useful not only during the day, but it also takes the place of an ordinary alarm-clock in the early morning. The hinge on which the back of the watch moves is placed immediately below the winding-knob, allowing the back to be opened so as to form a support upon which the watch can stand on a table by the side of the bed. The figures and hands are painted with the finest radium compound, and are therefore clearly visible in the dark. Moreover, the luminosity is permanent, a specially valuable feature in a pocket-watch, as the dial does not need to be exposed in order to be made visible, but can be read with ease at any hour of the day or night and in any place.

#### THE HOUSING PROBLEM IN SCOTLAND.

It is to be hoped that the recently issued Report of the Royal Commission on Housing in Scotland will prove an epoch-making document. Its length will probably deter many from reading it, but a carefully prepared Summary of the Report has been published which will prove invaluable to the busy man who wishes to grasp the essential features of the situation. To this Summary Sir George McCrae, Vice-President of the Scottish Local Government Board, contributes the following foreword: 'The Report of the Royal Commission on Housing is a soul-stirring manifesto. I would it were possible to circulate it in every home in the land, so that all might read the terrible and tragic story of present-day housing in Scotland. Although necessarily lacking in various striking details to be found in the official publication, I heartily commend this abridgment, which gives a clear survey of the ground covered by the Report, and will, I hope, induce many to peruse the larger work. This devastating war, with all its horrors, its sacrifices, and its heroisms, is teaching us many things. It has brought us into closer touch with the realities of life. It has given us a wider outlook, a sterner sense of duty. It has stirred our imagination to grasp what have hitherto appeared to be elusive possibilities. When the carnival of blood is over we shall be "up against" new problems which will not be solved by the old formulæ. We shall, indeed, be creating a new world on the wreckage of many cherished opinions and economic beliefs. In no department of national activity will the new spirit find fuller or freer development than in the sphere of municipal government. Our civic rulers will need to take bolder glimpses into the

future, and be prepared to face still larger responsibilities with confidence and courage. Especially will this be necessary in the domain of health and housing. The need is clamant and insistent, the opportunity inviting and unique. The old fear of intolerable financial burdens has been dispelled. The State has come to the rescue of the Local Authority. In the year 1912, speaking at a Housing and Town-Planning Conference, realising the difficulties which even then confronted Local Authorities, I pleaded for State assistance for housing to enable them to remove a grave scandal from our midst. But for the war that assistance might have tarried by the way. With this stumbling-block removed, there can be no going back. The conscience of the nation has been stirred. The response of the Local Authorities to the recent requisitions of the Local Government Board has been most gratifying. The extent of their necessities amply justifies the conclusions of the Royal Commission. The interest displayed by the Local Authorities is a pledge that they realise to the full the great opportunity afforded them of helping to create a better Scotland, a Scotland worthier of our race. May we hasten the time when those grim wastes of desolation, relieved only by still more hideous rows of miners' houses, when the rural pig-sties which serve as a substitute for human dwellings, and the fetid areas of our city slums will give place to a healthier environment, where the light of heaven will not be proscribed, and where every house will merit the name of home!'

*To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.*

#### JOY'S POWER.

A STONE, when in the water cast, sets wide  
And ever wider circles rippling on  
The water's face; the circles are not gone  
Till they have reached from side to farther side.  
The ripples catch the sunshine—gleam and glance  
Till the clear water stirs, a living thing,  
Moved to its depths, responsive, answering  
The impulse strong that set its waves a-dance.

When in the heart is born true happiness,  
Such living joy lets countless ripples free  
To catch the Sun of Love's great power to bless,  
Till all are moved in that deep ecstasy;  
Heart answers heart in one great consciousness,  
And sings a song of joy eternally.

FRANCIS ANNESLEY.

#### \*. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

### A LITTLE SHIP.

By 'TAFFRAIL,' Author of *Pincher Martin, O.D.*; *The Sub*; *Carry On!* &c.

CHAPTER I.—THE OLD SHIP AND THE NEW.

I.

I WAS working in the garden, hoeing the potato-patch, to be precise. Certainly, you may say that a naval officer has no right to have a house and a small strip of garden in war-time. He should be at sea, confounding the King's and his own enemies; but, as luck would have it, my ship had come in from sea that very morning. Moreover, it was the twenty-third of the month, and of those three and twenty days in the merry month of May we had spent no fewer than seventeen and three-quarters gallivanting about the North Sea on our lawful business. I forget how many miles we had steamed.

Also, if one is married, one's wife must live somewhere, and, as it happened, we had taken this particular house a full six months before the Kaiser set Europe ablaze from end to end. It was not until some time later, however, that we converted half the minute lawn at the back of the establishment into a potato-patch. It was some business, too, and the first year we got no potatoes larger than walnuts.

The family life of naval officers is always peculiar. We, the husbands, spent most of our time at sea, only getting ashore for a few hours in the afternoons when there was nothing doing. But activity and relaxation alternated with such frequency. At five o'clock in the morning one might actively be confounding the unspeakable Boche on the high seas; while twelve hours later, arrayed in flannels, one disported one's self in mixed doubles on the tennis-courts. The Hun was always close. Indeed, one could even strafe him, or be strafed, at breakfast-time, and be sowing sweet-peas in one's garden by two in the afternoon. And long before Zeppelin or aeroplane raids were carried out on London, our wives, hanging out of their bedroom windows at all hours of the night, and in strict defiance of the warnings of the special constables, were wont to regard the sausage-shaped monsters floating in the sky and illuminated in the beams of the searchlights. Rumour even said that the wives living in one road, in necessarily *négligé* raiment, were wont to forgather in each other's houses for late suppers or early breakfasts, call them what you will, after these entertainments ceased.

So, as they badly wanted it, I was hoeing the potatoes, while Michael, our eight-year-old Irish terrier, who loves gardening, was sitting on his haunches with his tongue hanging out, superintending my labours. Dick, the Sealyham, was absent from his place of duty at his master's side. He was investigating a neighbour's dust-bin. I am still thinking of a satisfactory method of camouflaging dust-bins.

Then it was, at about half-past three, that I saw Parsons coming down the road in some haste, with his baggy-bottomed trousers flapping in the breeze. Parsons was my bluejacket servant, and I knew from experience that his unexpected arrival in the middle of the afternoon signified something out of the ordinary. He always was the harbinger of activity, and his sudden advent generally meant an order to raise steam for full speed with the utmost despatch, followed by a hurried exodus to sea. So, expecting a summons to return on board forthwith, I dropped the hoe, resumed my coat, and went to the gate to meet him.

'Well?' I asked. 'What is it? Raise steam?'

'No, sir. It's a signal,' said he, removing his cap and producing a folded paper from the lining thereof, the place where the sailor invariably places important documents for safe keeping. 'The sub-lieutenant thought you'd like to have it at once, sir.'

He mopped his shining face, for the day was hot and he had walked fast.

The sub-lieutenant was wrong in his surmise, for I read the paper with my eyes starting out of my head, and feeling sick all over.

'You are appointed to *Triptolemus*,' it said tersely. 'Your relief in present ship will be joining to-morrow, Thursday.'

It had come at last. I had half-expected to leave for some months, for my time was up, and the ship, though people had come to gaze at her in admiration and envy in 1914, when she was yet considered rather a wonderful craft of a new type, was becoming elderly, and was leaving shortly for a new sphere of activity. Destroyers age rapidly in war-time when they are turned out by the score. But I had served for two and a half

years in her; had been in her, in fact, ever since she had come brand-new out of the builders' yard in '14, and hated the idea of turning her over, with her crew, to some one else. I looked upon her as my ship. We had grown up together, so to speak, until I knew, or thought I knew, her every whim and fancy, her every rivet and stanchion.

There was a dent in her side to remind me of the dark and blustery night when she became contrary, and no artifice of mine would induce her to answer her helm, and I nudged her rather hard into an oiler. There was a wrinkle in the stern plating where a blunt-nosed steam-trawler had butted into the poor old dear, and a piece of new plate on the fore-castle and another on the ship's side where a descending 6-inch shell from a shore battery had driven its way through the mess-deck and overboard without exploding. If the fuse of that shell had been a little better, I should not be writing this.

That particular projectile had been one of many others which nearly, but not quite, did for us. Three or four miles of hostile coast had sparkled with wicked-looking gun-flashes, while we, dodging all we knew how, had run the gauntlet with spray fountains darting out of the water all round us, and the air full of a terrifying, demoniacal screeching. Altogether it had been one of the most exciting days in our lives; and on the mess-deck, to commemorate the occasion, attached to the beam overhead at the spot where the shell came through, was a mahogany strip bearing an inscription in brass letters. 'Lest we forget our Easter Monday, 1916,' it read, though it was far too merry a Bank Holiday for any of us to be likely to banish it from our memories.

Yes, I loved that ship and everything to do with her. I was fond of her officers and men, for most of us had served together in fair weather and foul, in good times and in bad, for thirty months—thirty months of war. And war, with all its trials and vicissitudes, welds a ship together in no uncertain method. Ship's company, officers, and vessel learn to work together in a manner that years of peace-time training can never accomplish; and living constantly on board our little craft made us know each other's virtues and accomplishments, faults and failings, ways and tricks, to a nicety. We had all been through the mill together. We had learnt, in the great majority of cases, through bitter experience.

Altogether we fancied that our ship was THE ship of the whole destroyer navy. I don't say that she was any better than many others; merely that we thought so. After all, she was OUR ship, and we took an overwhelming pride in her; and that, if you come to think of it, is the life and soul of the service.

And the flotilla, too, the force to which we were all so proud to belong—it was a bitter

wrench to have to leave it, to cast aside the friends and associations of thirty months, and to have to start afresh elsewhere. It felt like going to a new school.

And who on earth was Triptolemus, anyway? I did not discover until afterwards that he was the son of Oceanus and Terra, a great favourite of the goddess Ceres, who cured him of a dangerous illness in his early youth, and subsequently taught him agriculture. Afterwards, in Ceres's chariot drawn by dragons, he carried seed-corn to all the inhabitants of the earth, and imparted to them the knowledge given to him by the goddess.

No; Mr Triptolemus—a fearful mouthful which the sailors would never be able to pronounce—left me rather cold. I much preferred my old ship, which was named after a bygone admiral, an officer who had led the fleet into action at Copenhagen, and in reference to whom the immortal Nelson himself, when asked to select a 'captain of the fleet,' or master-navigator on his staff, said, 'I will have — or none.'

We had heard of this saying from the present-day relatives of the gallant old warrior, whose picture hung in our wardroom; and from the very date of commissioning, '— or none' had been our proud motto. We had it exhibited on deck in brass letters on a scroll for everybody to see and to admire, and beneath it was a brass plate giving an abbreviated account of our namesake's career.

So I was very sad when I thought of what the old ship meant to me.

'You'd better go back to the ship and start packing my gear,' I told Parsons glumly.

He saluted and went off; while I, sick at heart and utterly miserable, went into the house to break the evil news to the sharer of my woes and joys.

'What is the name of the new destroyer?' she asked.

'*Triptolemus*,' I said very distinctly.

'Never heard of him,' she said. 'But I suppose it means giving up the house?'

'I'm afraid so. I know she isn't coming here.'

She fingered a china ornament on the mantel-piece, and looked very troubled, for the house was the same to her as the ship was to me. We had been married for eight years, during most of which we had followed a sort of nomad existence in rooms—rooms good, bad, and strangely indifferent. This was the first house of our own we had ever lived in.

I did my best to console her.

'Well,' she said at last, smiling in spite of her feelings, 'I suppose it can't be helped; but I shall simply hate giving up all this—simply hate it! I shan't see anything of you; and even if I do, I suppose it will mean living in dirty, smutty rooms again!'

'It's the fortune of war, poor old girl! I can't help it. I must go where they send me.'

And so, very sadly, we went together into the garden and talked it over, while I continued to hoe the potatoes. I felt I absolutely must do something to alleviate my thoughts, and for the time I was far too overcome to recollect that somebody else would benefit by my labours; that some one I had never seen might eat the potatoes we had taken such infinite care and trouble in planting.

And at that instant Dick, with a succulent chicken-leg in his mouth, and a sheepish expression on his face, came trotting down the garden path. Now, chicken-bones out of other people's dust-bins are not good for little dogs. Chicken-bones are not good for them in any circumstances, since they are apt to splinter. So there was trouble in the camp, and the culprit, dropping his booty, yelped twice, and fled like a streak of triple-greased lightning. Michael, with an expression on his face which said, 'Well, I'm a jolly good dog, anyhow. You never catch me dust-binning,' looked on and smiled. No; we had never caught him at dust-bins, but he sometimes developed an unholy penchant for rolling on dead sea-gulls.

## II.

By the next evening, having turned over my orders, books, papers, and documents to my relief, and having said good-bye to officers and men, I was a gentleman at large. But not for very long, for forty-eight hours later my wife and myself were in the train on our way to the northern port where the *Triptolemus* was being built. It would be ten days before I finally took the ship over from the contractors and sallied forth on the high seas; and ten days with one's wife in war-time, even in a strange hotel, are too good to be missed. We had left the dogs behind for the time being, and having seen the last of me, my wife would return south to the house, there to await word to pay it off, let it if possible, and rejoin me elsewhere with the dogs, and what household appurtenances the railway company would condescend to convey.

And one fine morning I found myself standing on a wooden jetty in a busy shipbuilding yard, gazing at my new ship. Ugly as her name was, I must confess that I liked the look of her, and, from what they told me, she promised to be a good three knots faster than the old vessel. So I went on board, and climbed up and down ladders, and delved into every hole and corner—the bridge, mess-decks, wardroom, cabins, engine-room; everywhere, in fact, where I possibly could go without upsetting the dozens of workmen who swarmed on board with their tools and pots of paint. And, lo! I began to take an interest in the ship, for I found her good. The 'chief,' otherwise the engineer officer, whom I had met before, had joined several months previously to superintend the preliminary trials and the placing on board of the various engines,

machines, and fittings pertaining to his special department—boilers, turbines, pumps, air-compressors, steering-engine, and a hundred and one other gilguys, whose names alone were familiar to me. The gunner (T.) had also made his appearance some weeks before, and what with his torpedoes and electrical apparatus, which seemed to arrive piecemeal and daily in wooden crates and cases, some the size of pantechicon vans, and others barely larger than cigar-boxes, he was a very busy man.

The 'advance party,' a few ratings of the deck and engine-room departments, had come north with him from their depot, and were billeted in quarters outside the yard. In fact, the first thing I had to listen to was a bitter complaint as to the inferiority of the breakfasts supplied to them. The matter was soon rectified, but surely it takes a bluejacket to grumble at boiled haddock and poached eggs for the morning meal.

The rest of the crew would join just before the final trials, and they, from what I could see of it, would have their work cut out to get the ship ready by her proper date; for not very far away was a large shed filled to overflowing with mountains of stores in bales, crates, drums, and packing-cases, which somehow had to be stored on board. Everything was there, from spare sparking-plugs for the motor-boat to candles, from screw-drivers to sealing-wax. And a little farther away, in a special building, padlocked, sealed, and guarded by a private of the Royal Defence Corps wearing the '82 Egyptian ribbons, were the shell and cartridges for the guns, the T.N.T. filled warheads for the torpedoes, and other highly dangerous and explosive contrivances with which we hoped presently to achieve the discomfiture of Brother Boche.

My first interview with the shipyard manager, Mr Matthew, to whose office I presently went to make my number, was rather unexpected, to say the least of it. I found myself in the presence of a thick-set, sturdy little man, with bristling iron-gray hair, keen gray eyes, and a ferocious expression. Evidently he knew destroyer officers of old—he should have, seeing that his firm turned out a destroyer every six or eight weeks—and regarded them as villains of the most lurid dye who wished to run away, or persuade him into parting, with all the paint and enamel in his perishing old shipyard. Indeed, after my introduction by the chief, my polite 'Good-morning!' and a perfunctory handshake, he stood there regarding me in a fierce and stony silence, with his eyebrows bristling like a nail-brush. Not that he alarmed me. On the contrary, I was merely amused, and began to wonder what had bitten him, or if this was his usual behaviour.

Then he burst forth: 'Good-morning, commander! I'm glad to meet you, and before long I hope to speed the parting guest!'

I must confess that he didn't look pleased to

see me; but his remark about speeding the parting guest struck me as rather inhospitable.

'There is one thing I want you to understand,' he went on in a roar like the bull of Bashan, 'and that is'—he paused, looking at me to see how I was taking him, and then wagged an admonitory finger in my face and leant forward as if he were telling me something highly confidential—'that is, that not one drop of paint, not one speck of enamel, not one pint of varnish, beyond the bare Admiralty allowance will I put on board your ship!' And with this final remark he thumped his fist on the desk until the ink-pot nearly capsized. 'That's flat, isn't it?' he bellowed.

'Good heavens!' I thought to myself; 'verily, the man must be mad!'

'I am not aware that I have asked for enamel or varnish,' I said in my most conciliatory manner.

'No; but you will sooner or later!' he almost shouted, wagging that forefinger of his in front of my nose. 'You're all tarred with the same brush! I know you!'

I laughed.

'Now we understand each other,' he went on more gently, 'I hope I shall see you at lunch at one-thirty. He'—indicating the chief—'will show you where we have it. Let me see,' he added innocently, screwing up one eye. 'How long is it you've been with us?'

'About five months,' the chief told him.

'And five months too long!' snapped the most remarkable Mr Matthew with the sweetest of smiles. 'I sha'n't be at all sorry to see the last of you. Speed the parting guest!'

But the heart of Mr Matthew, for all his abrupt manner, was very much in the right place; while the shipyard over which he held sway was one of the most efficient I have ever known. They have built men-o'-war of all classes for many long years, and if they stipulated to deliver a ship at such and such a time, she was completed to the very day, hour, and minute agreed upon; while such a thing as a break-down on the trials was practically unheard of. Their ships are good ships, and the *Triptolemus*, as we soon discovered, was very good.

The daily lunch with the firm's bigwigs was quite an amusing function. All the naval officers attended, and Mr Matthew kept us very much alive, particularly when he regaled us with stories of the Dumtavis Salmon Club. Only Mr Matthew can tell you what the D.S.C.—Salmon Club, I mean; not the 'Distinguished Service Cross'—exists for. Personally, I don't think it has much to do with salmon, except in the mayonnaise. There were also friendly disputes with Mr Bunderson, the firm's secretary, in regard to certain of Mr Bunderson's adventures in London.

And Mr Matthew had a wonderful memory. He seemed to remember everything he had ever read, particularly the *Ingoldsby Legends* and *The Dead Drummer of Salisbury Plain*. Moreover, he was a man of habit. Every day at lunch he was provided with a large tumbler of soda-water, all of which, except about three inches, he drank with his food. At the close of the meal he was handed a wine-glass half-full of whisky, and this he diluted with half the remains of the soda from the tumbler. He then consumed half the contents of the wine-glass, and rediluting the remains with the rest of the soda, disposed of that. But the remarkable thing about the ritual was that he never by any chance made a miscalculation. I watched him many times, but never once did I observe him fail to leave exactly the right amount of soda in the large tumbler.

And that trivial habit, absurd though it may sound, reminded me of more important things. The accuracy with which it was carried out day after day was typical of the spirit of orderliness, routine, and efficiency which prevailed in the shipyard, and both the remarkable Mr Matthew and the establishment he represents have my sincere admiration. They turn out the best and the soundest of ships I have ever come across, if the *Triptolemus* is a fair sample of their handiwork. I say so advisedly, for a good few thousand miles of sea-water have passed under her bottom since the day we commissioned her. The shipyard well deserves its nickname of 'The Portsmouth Dockyard of the North.' Indeed—But what is the good of my enlarging on the subject? Nothing that I can say will add to its reputation, nor could the adamant Mr Matthew ever be caused to blush.

Speaking of shipyards, by the same token, reminds me of something. Do you know why, in all Government and private dockyards, the hard billycock hat is the universal headgear in use by all the more important officials? The grades, starting from the bottom, run somewhat as follows: workmen, chargemen, inspectors, and foremen, with, senior to the foremen, the other more brilliant luminaries of the fourth, third, second, and first magnitudes. And nobody under the rank of inspector wears a billycock hat, while all the members of the senior grades invariably do. It is as much the badge of their exalted office as are the gaiters of a bishop, or the 'brass hat' in either of the services.

And why do they wear this unbecoming and inconvenient headgear? Why, to keep possible red-hot rivets descending from aloft from impinging on their valuable skulls. One is tempted to think that the heads of the actual workmen must be very hard.

(Continued on page 313.)

## FOOD VALUES.

By ROBERT BELL, M.D., F.R.F.P.S., Author of *Diet and Health, &c.*

**I**F the public would only devote a little time to the study of food values, and then exercise a modicum of common-sense and think for itself, instead of allowing itself to be blindly led into accepting as truth a fallacy which has proved for ages past to be productive of more bodily and moral decadence than those who have not given the question serious thought have any conception of, there would be less fuss made about meatless days. Indeed, they would be regarded as blessings in disguise.

Butcher's meat, after all, is only a second-hand article. As every one knows, it is produced solely from vegetable material, and that of the lowest grade, which has been assimilated by the animal, and which has enabled it to develop an amount of power and freedom from disease, which man, in consequence of his disobedience to nature's laws, does not possess.

Moreover, flesh meat is not a pure article of diet. It contains certain ingredients, named purins, which act as slow poisons in consequence of their being inimical to healthy cell-life. These consist of substances which were in the process of being excreted when the animal was slaughtered, and consequently were retained in the tissues from which they were in course of being expelled at the time of its death.

There is not a single anatomical or physiological characteristic in man's organs of digestion and assimilation which suggests that he has the remotest connection with the carnivora. There is, however, one remarkable fact that is worthy of notice and consideration—namely, that when man degenerated by associating himself with the carnivora, which he did when he killed to eat, his moral as well as his physical tone deteriorated accordingly, and they will continue to sink still farther until he begins to respect nature's laws, as it is his bounden duty to do.

Is it possible to find a more noble animal than the horse; a more useful one, for domestic purposes, than the cow; or one more powerful than the elephant? Yet their diet consists entirely of nature's gifts to them; and permit me to add, they are not subject to the diseases which afflict man. Indeed, in their natural state they are free from disease in any shape. It is only when they are brought under the influence of man that they cease to be immune; and their digestive apparatus is identical with that of man.

Now man has at his command a rare choice of the products of the earth, very many of which contain, weight for weight, much more nutritive value than the flesh of animals. They also have the advantage—and a great advantage it is—that in their natural condition they do not contain any of the pernicious purins I have referred to.

Take the cereals, for example. These contain, weight for weight, actually more food units than the best beef-steak in the market.

Consider this from a commercial point of view. It requires approximately an acre and a half of land to feed a bullock, and three years to bring it into condition for killing. At the most liberal estimate, the carcass will not contain more than four hundred pounds of boneless flesh and fat, and it will take a very fine specimen to yield that. An acre of arable land will yield, on an average, forty bushels of wheat, or their equivalent in oats or barley, in one of these three years; and in the other two probably fourteen tons of potatoes, or their equivalent in turnips or carrots.

Now let us estimate the food value of the produce of a cultivated acre of land at its lowest, and that of a bullock at its highest. Taking wheat as the standard, we find the former is twelve times greater than the latter. And when we also remember that the former is food which contains none of the elements of disease within it, while the latter is more or less responsible for disease in many of its disguises, what excuse can we have for disobeying nature's benevolent laws, and thus courting disaster, which in every instance is followed by reprisals in the form of penalties of a more or less pronounced type, and sometimes by severe suffering and premature death?

The wonderful variety of healthy and sustaining food in the form of fruit and other products of nature is so comprehensive, and is so conducive to the promotion of health and a green old age, that it would seem to savour of the grossest ingratitude to ignore her beneficent laws in the flagrant manner we are, as a nation, guilty of doing. Moreover, the products of the soil not only vary in attractive appearance, taste, and nourishing properties, but they adapt themselves to the climatic necessities of every latitude, so that there exist no grounds for grumbling.

Furthermore, we shall find that the greater the labour entailed in procuring food, the greater and more self-reliant, the more intelligent and courageous the nations will prove to be so long as they obey nature's laws. If they go astray, however, they will correspondingly deteriorate both physically and morally. And no form of sophistry will prove of the least avail in attempting to controvert this statement. Disobey nature's laws persistently (though, in truth, she is wonderfully forbearing), and the penalty, in the form of disease, is certain to follow; much more certainly, I may add, than the penalty which follows the disobedience of human laws.

Henslowe has put this fact into what may

possibly be considered unduly strong, though true, language: 'It is a greater disgrace to be in a hospital than to be in gaol. The former shows we have broken a law of nature, the latter that we have transgressed only a law of man.'

It would be well not to lose sight of the fact that man is the only animal who destroys part of the value of his food by cooking. I hope it will not be inferred from this statement that everything should be taken in an uncooked condition, but only that when cooking is resorted to, it should be done on conservative principles, so that none of the essential ingredients are allowed to escape in the process. Bread and other forms of food made from cereals are cooked, as we know, but their essential organic salts are all retained, though the vital principles, which I have named 'vitols,' are destroyed, and the loss of these is an important matter. This, however, can be made up for if we abstain from all other 'dead,' or, as I might describe it, 'devitalised' material, and I would insist upon a considerable amount of our dietary consisting of ripe fruit, salads, milk in its natural condition, cheese, and nuts of all kinds and variety, all of which need no artificial cooking at all. In order to retain their natural salts, vegetables should never be boiled, but steamed, and they should not be *overcooked*.

From the point of view of healthy blood it is a mistake either to cook ripe fruit or to peel it (though it is always advisable to wash it if there is the least suspicion that it may have been contaminated), as the important organic salts, those essential to healthy cell-life, are, as a rule, contained in the skin or just under it. The same precautions should be taken with regard to potatoes, as the skin and the part lying immediately below it are the most valuable portions of the tuber from a food point of view. Potatoes, therefore, should be thoroughly washed, and always cooked in their skins.

I, of course, do not insist that the skin of either fruit or potatoes should be swallowed, but it should always be thoroughly masticated, so that the salts may be extracted from it in the process. The skin may then be ejected if it is thought desirable, though for my part I prefer the skin of a potato to the interior. It is hardly necessary to add that potatoes are not wholesome in an uncooked condition; but this does not apply to fruit. Cooking deprives the latter of much of its nutritive value, and when cooked it is more liable to ferment in the stomach than when it is in its fresh condition. It must be borne in mind, however, that fruit, as well as

all salads and nuts, must be thoroughly masticated. If this is done, it will be found that it forms a much more valuable food in its natural state than when cooked.

Apples, onions, and carrots are especially excellent articles of diet, and should be eaten every day; dried fruits, such as sultana raisins, figs, dates, and prunes, in an uncooked condition, but well washed, are also of considerable value. As an indication of the most nutritious and health-giving forms of diet, I give a typical menu for a day. Breakfast should consist of some kind of fruit, such as an apple, a pear, an orange, a melon, or a couple of bananas, whole-wheat bread and butter, a fresh egg, lightly boiled or poached, and a cup of China tea infused not more than a minute. Lunch may comprise a fruit or vegetable salad, whole-wheat meal bread and butter and cheese, and from two to four ounces of sultana raisins. If preferred, an ounce or two of nut-kernels, including almonds, may be substituted for the cheese. An excellent dinner may be provided on the following lines. The stock for the soup should be made by boiling haricot beans, lentils, peas, or broad beans, which should be thoroughly macerated and the liquid strained off. When the soup comes to the table, a tablespoonful of carrot, onion, turnip, parsnip, or celery juice or pulp should be added for each person, and the soup seasoned to taste. A second course might consist of a little fish, with salad of tomatoes, lettuce, cucumber, radishes, or celery, or boiled sliced beetroot, and whole-wheat meal bread. This might be followed by macaroni au gratin or cauliflower au gratin, and a milk pudding or a cold shape served with cream and jam or marmalade. Dessert should consist of fruit in its season and nuts. The fruit and salad portions of the meal should never be omitted; in other respects the menu may be decreased or varied to suit individual tastes and the attendant circumstances. The writer has no objection to the use of stimulants in moderation, but these, and all other liquids, should be taken not during the meal, but after it.

A normal body is practically proof against disease. So long as the cells are properly nourished, and are therefore functioning properly, and doing the work for which they are designed, there is no opportunity afforded for micro-organisms to gain a foothold and start their vicious multiplication and disease-breeding activities. It is only when the vital resistance of the cells is lowered, and the germ-destroying power of the blood is lessened, that the microbes of disease obtain power to damage the organism.

## THE FORESTER'S GIRL

By Mrs W. F. IRVINE BELL, Author of *John Pardon's Choice*, *Ole Cam'ron*, &c.

CHAPTER XVII.—continued.

**GAVIN**—Gavin! Always had he come, like some knight of old, to Anita's rescue. How often, even in these last two months, when the forest silence and shadows filled her with sudden panic, had his firm, kind words braced her failing courage: 'There's nothing to be afraid of. Can't you believe me?' And now, so well had she learned to place her feet on the stepping-stones this man had laid for them, that in her hour of distress the yearning for comfort led her to seek it in the quiet, waste places which not long since had repelled her.

Heedless alike of breakfast and of the cold, polished stove mutely gaping to be filled with fiery fuel, she presently opened the cabin door, hid the key in the usual place, and, turning her back on the empty house, stepped out into the wilderness world of peace. Instinctively her feet turned towards the forest; but discovering how heavy still lay the dew on blade and leaf, and that the thick, dampened dust of the road had scarcely been disturbed by Jackson's wagon, which had passed and repassed unawares to her, she walked slowly in its tracks, her heart gradually lightening, and her mind growing more calm under the blue sky that stretched ribbon-like above her head, and in her nostrils 'earth's ten thousand fragrant incenses.'

Neither hat nor wrap cumbered her; but now and again, as a beam of sunshine through the trees struck warmly on neck and shoulders, she gave a comfortable little shiver and sigh of content. Enticed by the subtle voice of newly awakened susceptibilities, she wandered on, forgetful of time and distance, absorbing with ever-increasing pleasure the beauties of a brilliant autumn morning—radiant prisms of dew on drooping fronds of fir and spruce, bright wreaths of blackberry and bryony, brown fern and gray-green boulder. The forester's girl had indeed been 'born again.'

Presently a sound new to her ears caught her attention, a dry, scuttling sound, accompanied by a sharp 'tchk-tchk,' followed by the appearance of a beautiful little animal, having a bright fox-red coat with dark stripes, and squirrel-like head and tail. Quite unafraid, it halted in its brisk career up the slanting trunk of a half-recumbent tree, and sitting up on its hind-legs, regarded Anita with eyes like velvet diamonds.

'*Mon Dieu! mais tu es beau!*' exclaimed the girl, returning the little creature's gaze with interest, then gave a little, suppressed cry of delight as a duplicate of the first appeared over the mossy top of a big rock, his soft, striped cheeks bulging with pine-nuts, and proceeded to give chase to his mate. Up the leaning tree

they scuttled (for Mr Chipmunk is not prone to seek lofty heights, as is his larger kinsman of the squirrel tribe); while Anita, sunburned hands lightly clasped behind her back, her shapely head, with its crown of glossy hair, tipped back in her upward gaze, white forehead, cherry lips, and round chin outlined against a panel of blue sky, stood silently watching them, an expression of delight on her sweet face, and curving her mouth in a happy smile.

Such the picture that suddenly confronted Gavin Barrie as, rapidly making his way along the road, winding hither and thither among the woods, he rounded a sharp curve—a picture that caused him to catch his breath, and to bring him to a standstill; while within him all that was human, mortal, and masculine, aflame with an unreasoning passion, urged him to take the one swift step that should make the girl his own—to snatch her to his breast, crush the tiny hands, rain kisses on those full, red lips and soft, fair cheeks. *His* should she be to make or mar. Oh God, to *mar*! Only a second of time for the drama of a lifetime to be enacted, a brief instant while the Devil and Gavin's good angel fought for possession of the man. Then, as some struggling thing within him launched a prayer for strength, Gavin swiftly slipped his fingers through the collar of his dog. Why break in again upon the peace of mind of this innocent girl? She seemed happy; and he—— Barrie turned upon his heel; he would slip away into the forest undetected. But the man had reckoned without the dog. 'Bob,' too, had recognised a friend, and, straining at the collar, uttered a long whine of protest.

Anita turned, and alas for the revelation in those deep, dark eyes, the look of joy surprised in the beautiful face suddenly dyed carmine from chin to brow, the eager welcome in hands impulsively outstretched!

Gavin's gray eyes, alight now with the love that can offer itself on the altar of sacrifice, met Anita's, held them for a fleeting moment; then, as from some strange tongue, he heard himself saying, 'Shall I let him go?' And the next instant Anita, careless of dusty paws and slobbering jaws, was kneeling by the roadside, clasping in her arms an excited, wildly demonstrative red-brown dog.

'Oh "Bob," "Bob," dear old "Bob," I've been so lonely and missed you so!' she crooned, half-crying, and kissing the soft, silky head.

Lucky dog! Alas, poor Gavin!

In Anita's dark eyes he had read the message, and knew that in the hollow of his hand lay this girl's whole future, for weal or woe. One

word—the word now trembling on his lips—one touch of his hand, now tingling with such agony that he drove his nails into the hot palm, and his little Anita could never face life the same.

Steadily Gavin Barrie crossed the road, and, in just such banal tones as he might have used to a society belle, said, 'He'll make you awfully dirty, you know. "Bob" is no respecter of clothes. Here, let me help you up;' and he held out his hand.

But the girl did not accept it. An instant longer she crouched with the panting dog hugged tight; then, a little unsteadily and very white, struggled to her feet and turned towards home.

Gavin, the width of the road between them, walked along with her, grasping at commonplaces of conversation to save himself and her. 'I had no idea,' he began, vividly conscious that with similar platitudes might he have addressed My Lady Vere de Vere at one of his mother's garden-parties—'I had no idea that we were such near neighbours. Dr Grey and I are camping on Goose Lake, which, I understand, is only a mile or so from the forester's cabin.' He glanced inquiringly at his companion, but she merely nodded her head and walked on in silence. 'Grey has just deserted me,' Barrie continued in even tones. 'That goading conscience of his would spur him out of his own grave were he buried forty feet deep! So he is off to Silver Creek again. Something wrong with the child he was looking after before. I shall miss him badly; he was the *cook*, you see,' added Gavin in a not very successful attempt at a joke; but there was no answering smile on Anita's tightly closed lips, and he went on desperately, 'Kenneth had already become quite an expert at flapjacks, but my own first experiment nearly killed even "Bob." That is why we asked your friend, Mrs King, to make some bread; that, and to save flour. So I came across with the doctor to fetch it, but found she had despatched my loaf up to your place.' Still no response from the girl at his side. Bitterly Gavin, himself supersensitive, realised that this sensitive little instrument within reach of his hand would vibrate solely to a master-bow, and that his clumsy fingers were but as a mute on the tightly stretched strings. Every trite, insipid word that he uttered—was it perhaps lowering him in her eyes? Was this struggle worth while? So the man battled with himself; yet when he spoke again it was with the same cold restraint. 'By the way,' he said, 'Mrs King gave me a message for you.'

Ah! now at length he had caught her atten-

tion, and she slackened her pace, for they had been walking rapidly. Relieved at this change in her attitude, Gavin Barrie, the taciturn, and himself a despiser of messages, found himself eagerly elaborating the few words of a Western ranch-woman. 'She sent you her—her *love*, I believe it was,' he said with his most courteous 'company' manner, 'and would be pleased if you could come down and see her before they go away.'

'Are they going out soon?' asked Anita, a thrill of anxious regret in her voice; then added half to herself, 'Then I shall be the only woman left in the mountains!' and she lifted a pair of eyes to Gavin's, so dark and troubled that on the instant his preconceived idea that she was happy collapsed, and a whirlwind of anger shook him as the thought shot through his mind, 'The *brute*! Is he making her life wretched?' Hastily taking out his cigarette, he lit one; then, blowing a great cloud of smoke, he replied with a bravely assumed display of enthusiasm, 'Then you should consider yourself a very *lucky* woman, Anita! The late autumn here must be superb; and fancy leaving *this*!' and he gave an embracing sweep of his hand over the wonderland of earth and sky. 'Fancy leaving all *this* for the crowded noisiness of one of those valley towns! I plan to stay on up here as late as one is allowed to fish.' Then, seeing a sudden flame of gladness leap up in the girl's pale face, he resolutely stamped it out by adding, 'That is, of course, if the doctor comes back soon. Otherwise, I would rather go on to Tahoe; there's nothing to keep me here.'

Anita started as though a whip-lash had touched her; she was suffering and bewildered. Gavin saw her start, knew that each trivial word was a blow to the girl, and she looked so white and pitiful. Suddenly before his mind rose a vision of the little Anita beneath the cherry-blossoms in the garden of the 'Rose d'Or.' A lump rose in his throat; his arms ached to gather her to him. Why keep up this absurd battle against the call of their own hearts?

And then, all at once, lo! a quick flush of colour in Anita's face, a look of rapt delight, as, pointing skywards, she cried, 'Oh, look! Look at those beautiful wild geese! See how low they are flying! I can see their heads, and their feet folded backwards. I never before saw them fly so low;' and she stood motionless, following with lustrous eyes the long line of gray birds so swiftly and silently cleaving the blue sky.

## JERUSALEM LIBERATED.

By R. C. WYNNDHAM, Author of 'Predictions and Prophecies Relating to the Kaiser.'

**T**HE crusades of the Middle Ages had as their object the deliverance of Jerusalem and the Holy Land from the Saracens, and the First Crusade so far succeeded that it captured the Holy City in the year 1099, and set up Godfrey of Bouillon as the first Christian king of Jerusalem. But this success was not a lasting one. Eighty-eight years after the coronation of Godfrey the city surrendered to the famous Saladin, and despite repeated attempts at its recapture by zealous crusaders, it remained in Mohammedan hands until our own day. It was not until the crusade of the twentieth century—if we may so call it—that the sacred spots so dear to Christians and Jews have been set free from the Infidel's yoke, from the opprobrious rule of Mohammedanism, from Turkey and everything Turkish. But it is with shame that we see to-day the armies of three Christian countries—Germany, Austria, and Bulgaria—waging the battles of Mohammedans against Christians.

But this, of course, is by no means the first time that Christian Powers have taken the part of Turkey. Soon after the Crimean war of 1855, an Austrian prelate, Monsignor Mislin, visited the Holy Sepulchre, and in his diary he records the treaty of 15th June 1840, and the defence of Palestine by the combined fleets of Britain and Austria on behalf of Turkey against Egypt and France. And Monsignor continues: 'This is what the Crusade of the nineteenth century was! It is easy to be seen that it was far from the Crusade of St Louis of France; in our day we have seen the banner of the Cross float side by side with the banner of the Infidel in defiance of other Christian nations. Such are the miracles of diplomacy and of incredulity.' The writer, were he still alive, would have cause to be astonished now for a far different reason. This alliance of Britain and Austria with Turkey in 1840 was to prevent the preponderance of French diplomacy in the East, as the alliance of Britain, France, and Turkey in 1855 that of Russian influence. Those German papers which pretend a parallel case in the present war shut their eyes to these facts. All the doctors who have attempted for nearly a century to heal the 'Sick Man' have had but one object—namely, to avoid the heritage of the 'Sick Man' from falling into other hands than theirs; and so the dying agony of the moribund Turkey has been prolonged by a system of counteractions which only aggravated the malady without either killing or curing the invalid, while the doctors who took the cure in hand knew not how to, or could not, put new life into the veins of the dying man.

Germany now tries her hand, for one great

object of the Kaiser is to be crowned King of Jerusalem in Jerusalem. And here it may be noted in parenthesis that another idle dream of William II. is to be crowned Emperor of Rome in Rome, by the Pope, for which event he had his throne made some years ago and placed in the Palazzo Cafferelli, on the Capitol, where it still stands—why and wherefore is an enigma.

On other battlefields the armies of the Sultan might well be allied with those of another state for a common objective; but with regard to Jerusalem it is unnatural for the Cross and the Crescent to be found on the same side. The spirit which animates the Turk is certainly anti-Christian, but that which has stirred up Turkey's Allies in the war is the desire for conquest; and with this end in view they care not how they sully the name of Christian. Not all the German sophistry can controvert these truths. An old Oriental proverb, published in a work entitled *The Second Coming of Mahomet*, says, among other things, that Turkey would be at a future day the ally of a nation 'hostile to Europe;' and that, conquered, she would be compelled to abandon Constantinople and Armenia.

Whether the prediction of the unknown Arab prophet may come true or not, it certainly looks bad for Turkey. In this old prophecy the name of Germany is written in letters which cannot be mistaken—'A nation hostile to Europe.'

The alliance of Lutheran Germany with Mohammedan Turkey has proceeded by steps which only those who are blind have not clearly seen. In 1896 the Kaiser congratulated the Sultan on the victories obtained by his army (reorganised and trained by Germans) against the Christian subjects of King Constantine of Greece, that same Constantine who has paid for his tender love for his imperial brother-in-law with his throne.

In every phase of the Macedonian question Berlin diplomacy has been at the flank of Turkey as its support. The concession of the Bagdad Railway was obtained as the price of this, and so patent was it that a French journalist could write: 'All the documents of the German railway of Haidar Pasha have been bathed in Christian blood.'

After the Armenian massacres of Constantinople, William II. of Germany paid a visit to Abd-ul-Hamid (the man stamped by the British Parliament as the 'Red Sultan'), not to remonstrate with him, but to offer his friendship, and to advise him how to set himself right with Christian Europe and America. The example is without precedent and without imitators save one, Ferdinand of Bulgaria, who a few years

later (that is, after the proclamation of independence in 1898), following in the shadow of his Teutonic patron, also visited the Sultan Abd-ul-Hamid's successor, Mahomet V.

From Constantinople Kaiser William went to Jerusalem, where he inaugurated the new German Roman Catholic church; and then, dressed as an Arab, he proceeded to place a wreath of laurel on the tomb of Saladin, the conqueror of the Christians in the twelfth century.

Let us examine the signs of the time immediately preceding and at the initiation of the war now raging. Germany was then an ally—a treacherous one—of Italy, for the Kaiser lent all his secret aid to the Turks during the Libyan campaign. Again he conspired (secretly, as usual) against the Christian nations in the Balkan war; but his crowning act of apostasy was his compelling the Sultan of Turkey to proclaim the 'Holy War,' by which three hundred millions of fanatic Mohammedans were by the law of their creed to slaughter every Christian in their path. True, his chief object was to cause rebellion in those countries subject to British rule in Asia and Africa; but, whatever were his motives, he is responsible for his actions, and the end never justifies the means. It mattered little how many thousands of Christians were massacred so long as he gained his object. The civilised world stood aghast at the fact that such a war should be proclaimed under the ægis of three professing Christian kings, one of whom bore the title of 'Eldest Daughter of the Church.'

The Holy War was a failure, not because Moslems had lost any of their old hatred for Christians, a hatred still as strong as ever, but because they had lost their former combativeness; though not for this failure can the Hohenzollern, the Hapsburg, or the Coburg-Gotha wash themselves of the shame before history. It was not their fault that the Holy War was a failure; on the contrary, they were sadly disappointed at the result.

The potent aid of Germany and her Allies has not been able to prevent the liberation of Jerusalem by Britain and her Allies. Let it be said with reverence that Islam infidelity and Christian renegation have been swept away by the will of the Almighty.

Thus Islamism, which has been forced to submit to the dictates of Germany, with the knife at its throat, and to the presence of the hated Christian in its territories, now sees Jerusalem gone to keep company with the lost provinces of Egypt, Tunis, Algeria, Tripoli, the Balkans, Arabia, Mesopotamia, &c.; while the Sultan of Turkey, sustained by the Emperor of Germany, continues to style himself lord of those countries. However, empty titles do the world no harm, but rather contribute to its amusement.

The fall of Jerusalem has undoubtedly done more harm to Turkey than all her other reverses,

for with it the struggle of centuries has concluded with the overthrow of the last bulwark of antique Islamism, which now remains only a record. Austria, which saw with joy the defeat of the Turk under the walls of Vienna in 1683 by John Sobieski, now laments Islam's disaster, and weeps for its foreshadowed doom. Most probably we shall see in the near future the story of Constantinople of 1453 reversed, without its horrors, and the Cross floating once more over St Sophia, to the confusion of the Crescent. When we consider the origin of the Turkish banner, that union of paganism and infidelity, we shall not be surprised at its destruction.

The 'Sick Man' must die at last; the unscrupulous Doctor Germany sits at his bedside making his will, in which he puts himself down as King of Jerusalem, one of his mad dreams; he ransacks the cupboards of the moribund to take possession of all he can get. However, Turkey, reduced to impotence, will cease to be a permanent peril to the peace of Europe; and the Christian religion, which nearly twenty centuries ago gave the death-blow to paganism, and planted its banner on the regeneration of society, morality, justice, and right, at last occupies the sacred places of its origin, so long profaned by the Turk; and in the Christmas celebration of the Nativity of the Saviour's birth, 1917, has been celebrated also the liberation of Jerusalem.

Even the Pope has been set at defiance by Germany and her Allies. All the prayers of the pontiff have not been able to prevent the soldiers under German command from carrying away the women from the city, or to keep them from plundering the sacred places, convents, Christian churches, and private houses, when forced to abandon the city.

When the news arrived of the capture of Jerusalem by the British soldiers and their Allies, the Cardinal Vicar of Rome issued an order for a *Te Deum* to be sung in the Church of Santa Croce in Gerusalemme, in Rome, the following Sunday. 'But,' added his Eminence, 'my joy is dimmed by the circumstance that not all who have had part in the liberation of Jerusalem are Catholics, like the pious Godfrey of Bouillon; but now that the Holy Sepulchre is in the hands of the Christians, let us augur that all who believe in Christianity will return to the unity of the Faith, under one invisible Head, Jesus Christ, and His Vicar on earth.' But the good Cardinal has his doubts about the realisation of this augury. So have many people, since heretic Britain is the liberator of Jerusalem.

Monseigneur Duchesne of the *Académie Française*, the celebrated historian of early Christianity, expresses his opinion in the following terms: 'The victory of the Allies over the Turkish world can do much to forward the peace of

Europe. It is another "front," that of the Orient, where the victory must be secured. With regard to the possession of the Holy Places, the resolution of the matter does not seem very simple, because we must remember that if Jerusalem is sacred to the Christians, it is sacred to the Mohammedans also, and more especially to the Jews, who look forward to return to the Holy Land. Certainly all will be arranged at the Peace Conference when the time arrives, but for us who hold to the prophecies of the Old Testament the restoration of the Jews to their own land is sure.'

Some there are who ask most inconsiderately, 'To whom shall fall the possession of Palestine after the war, seeing that the British general was not alone, but was aided by a small contingent of French and Italian troops?' But those persons forget, or seem to forget, that this war has not been one of annexation on the part of Britain and her Allies, but to give freedom to those states which have been wrongfully and cruelly deprived of it, and have been in bondage, some of them for centuries, as in the case of the Jews.

With regard to the future occupation of Palestine, certainly the Jews are the only people entitled to it, and the great meeting held in

London early in December last seems to point to their restoration. It is the glory of Britain and her sons that she has been the instrument chosen to fulfil the prophecy of Daniel, and to bring about the time when God's chosen people of old shall be 'gathered out of all lands' to enter into their ancient inheritance. It is with evident pleasure that the subjects of Great Britain throughout the world have seen their Government encouraging the scheme. Mr Balfour's letter to Lord Rothschild pledging the British Government to use its best endeavours for the establishment in Palestine of a home for the Jewish people has been welcomed with enthusiasm by Jews all over the world.

English, Irish, Scotch, and Welsh, as well as Canadians, Australians, New Zealanders, Indians, and men of South Africa, not forgetting French and Italians, all have lent their aid in the liberation of Jerusalem. It is much to be regretted that America joined the war too late for her soldiers to have a share in the glorious event, for the United States have done good work in Jerusalem, and in Palestine generally. However, it is a satisfaction to know that the great republic was duly represented at the entry of General Allenby into Jerusalem.

## A CROWDED HOUR.

By MARSHALL NORMAN.

I.

**D**INNER was over. The coffee stood upon the table. The flight commander was looking over the operation orders for the following day. Suddenly he glanced up. 'There's a special job on to-morrow,' he announced.

'Tough or otherwise?' some one queried.

'Pretty tough, I take it.'

'Then break it gently to us,' sighed Lorrie.

'My nerves are all of a twitter.'

'Well, it's this way. It's a one-bus job. We tossed for it between flights, and I lost.' He was interrupted by a chorus of groans. 'This bus has to go over to — and take some special photographs. It was decided that one bus flying high would be able to do it quicker and safer than a whole flock of geese floating around. And he would be able to climb higher.'

'I feel all of a doo-dah, all of a wonk,' moaned Lorrie from the other end of the table.

'What d'you think of it?' asked the flight commander.

'Sounds all right,' replied Blake, 'provided nothing goes wrong with the old engine.'

'What shall we do, then? Toss for it?'

'Right-o!' came the chorus.

'Good. Biggest number go out.'

Coins were produced and tossed. Four heads

and two tails came down. Jack Lorrie and Vernon Blake had to toss for the final decision. Lorrie spun the coin.

'It's a head,' sang out Blake.

'Wrong! It's a tail,' replied Lorrie, uncovering the coin.

'Cheerio!' exclaimed Blake, raising his coffee-cup. 'Here's to it.'

'What an escape!' breathed Lorrie. 'I feel in need of a stimulant. Pour me out a lime-juice, some one.'

'Which observer comes with me?' Blake asked.

'They'd better toss for it too,' replied the flight commander.

'No. I'm going with Blake,' put in Cope. 'I always work with him.'

'Good man, Cope,' said Blake.

'Well, it's not too bad,' said the flight commander. 'The idea is, you get up to eighteen thousand feet, dash over, get the photos, and come back at a hundred and twenty miles per hour, nose well down. And to lighten weight as much as possible, you carry only enough petrol to do the job—say enough for two and a half hours.'

'Sounds pretty easy to-night,' said Blake.

'It's a different story when it comes off to-morrow.'

'Never mind, Blake, old son; when you come back you'll get the M.C. and the D.S.O., and all the usual things. Then you'll go off to Buckingham Palace in your best pair of field-boots, and she'll love you ever after. Here endeth the first lesson.'

'Here's your map showing the squares required,' said the flight commander. 'You stand by to leave from 6 A.M.'

'What other jobs to-morrow?' asked some one.  
'Oh, just the usual stunts—that's all.'

## II.

It was a brilliant morning. Not a cloud flecked the glory of the sky. It was perfect for aerial photography.

Vernon Blake and Ronald Cope stood on the aerodrome dressed in the grotesque exuberance of flying kit. They were ready. The bus was awaiting them. The aerodrome orderly came up to Blake and saluted. 'The C.O. wants to speak to you on the telephone, sir.'

Blake walked across to the aerodrome telephone. 'Hallo!' he called. 'Good-morning, sir.'

'Ah! that you, Blake?' came the voice from the other end. 'Good-morning.'

'You want us to carry on, sir?'

'Yes. It looks all right for your job.'

'Yes, sir, it does.'

'Right, then! You can start at once. Good luck.'

Blake replaced the receiver and crossed over to the bus.

'Right-o, Cope. We carry on now.'

'Good enough,' replied Cope.

They gave the few final touches to their kit and climbed into their seats. Blake ran up his engine and glanced over his instruments. Then he called down the phone to Cope. 'You all right, Cope?'

'Yes, I'm all right. You?'

'Yes.'

Blake raised one hand and waggled it so that the mechanics could see the signal. They withdrew the chocks and stood clear. There was practically no wind. They could take straight off. Blake opened out his engine.

The graceful aeroplane ran straight over the ground gaining speed. In a curiously effortless way she left the 'drome and took to the air. Then she climbed upward rapidly. There is something in the take off and the landing of an aeroplane that prevents the movements from becoming stale. They are always interesting. They are either indescribably graceful or equally clumsy. Blake was an expert pilot, and that tells every time.

Up above, the bus was going nicely. She was Blake's own bus, and perfectly rigged. Her engine was good, and she climbed fast. Blake

sat easily in his seat, listening to the tuneful roar from his engine. His watchful eyes took in the never-ending story of his many instruments. And yet he had time to look about him—at the world below, with its little fields that became smaller as they rose, its doll's houses, and its miniature streams. It was a glorious morning. There was a bite in the air. It was the time for effort and song. And as he listened to the song of the tireless engine he realised that he was vividly alive. Flying had imbued in him a vague, indefinable sense of subconscious reasoning that told him things that the earthly folk know nothing of; and, as he sat with his attention fixed on the handling of his machine, this subtle sixth sense whispered to him the outside facts that the good pilot is always conscious of. It is the sort of intuitive instinct that must give a migratory bird its sense of direction and location.

They climbed rapidly to ten thousand feet, but after that their climbing speed fell off. But always the finger of the height-recorder travelled slowly round the dial. And in the meantime there were many interesting things to watch—the tiny houses that grew to mere pin-points, the woods that merged from greens to dark browns, the lakes that varied in tint chameleon-like, the towns that became so utterly insignificant, and, over there, the yellow fringe that met the waters of the sea; and, on that sea, the moving ships that caught the eye with the white splash of foam from bow and stern, the little boats that lay at anchor, in appearance like sausage balloons hanging in the sky; away beyond them all the land they fought for, a distant dullness on the farther landscape—Blighty.

Blake shivered involuntarily and glanced again at the height-recorder. He had, for the nonce, piloted his bus mechanically. The sensitive, moving finger had paused at a fraction over eighteen thousand feet. He lifted the telephone. 'Hallo, Cope!' he called down. 'Are you awake?'

'Yes, some!' came the muffled reply in his ear. 'Too bleedin' cold to snooze. What height are we?'

'Just over eighteen thou. We can go over now.'

'Right-o! The sooner the better.'

## III.

They crossed 'the lines,' that utterly repulsive blight that smears the fair face of France. It is repulsive not merely in the coarse physical sense, but also in the refined sense that hurts the eye. It is loathsome to look upon. It stands for all that is evil in civilisation. It looks it.

They were flying at a great height. Their engine was inaudible to those on the ground. They were a tiny speck against the blue background of sky. They were all but invisible.

It was a relief to get across without the crack and woof of Archie breaking into the even monotone of their engine. It gave every promise of a 'cushy' job of work.

At this height there were no enemy machines to be seen. Far below them they could see some Huns engaged in a scrap with a British patrol. But they had to carry on, for they had only a limited quantity of petrol in their tanks.

At last they reached the place they had to photograph. Blake turned the bus over the ground required. Cope buried his head in his cockpit, intent on securing the best possible areas. He glanced through his peep-hole and pulled the cord a dozen times. Then he lifted the telephone.

'I've got all the pictures of Hunland they want.'

'Right!' Blake answered.

Blake turned the bus until the compass read W.N.W. He seemed uneasy in his seat. He sat with his head cocked a little to one side, listening to the engine. He was not pleased with the sound of it. Every now and then he turned a little tap and vigorously operated the hand-pressure pump. The automatic pump had frozen up, and the engine was being starved. Quite suddenly it began to cough in a pathetic, forlorn sort of way. It emitted a big wuff of blue smoke and began to vibrate. Blake's face wore an anxious expression under his mask.

Cope, facing the tail, looking out for Huns, heard the engine coughing. Like most observers, he knew little of the working of the engine, but he knew enough of his work to dislike intensely any uneven running over Hunland. He grabbed for the phone again. 'Anything wrong with the old whirligig?' he inquired.

For a moment Blake did not reply. He was busy nursing the engine. This increased Cope's anxiety.

'What's the trouble, Blake, old son?'

'Valves and ignition getting fed up, I think,' Blake replied.

'Is it serious?'

'Yes. Don't you see how slowly we are travelling? There's a strong wind up here.'

The engine spluttered and coughed again.

'What's that you said? You've got the wind up?'

'No. There—is—a—strong—west—wind—blowing—up—here.'

'Oh yes. Sorry!'

'We're travelling very slowly, and if the engine conks we'll never make across the lines. Probably land just behind the Hun trenches and get done in.'

'Kee-ristopher! What are you going to do?'

'Look out for a deserted bit of Hunland, and get down there without being observed. That is, if the engine goes "phut."'

The engine's spluttering grew into a consumptive cough. The revs dropped off. The

whole bus rattled disconsolately; and, after a final touching effort to pick up, it suddenly went completely dud. At the same instant Blake turned off the petrol-supply and ceased his valiant efforts with the hand-pressure pump. They began to spiral down.

'Hallo!' called Blake. 'Keep your eyes skinned for a really deserted bit of country while we're going down.'

'Right-o!'

Cope stood up in his cockpit and looked around him. There was not another machine in sight. He held on to the gun-mounting as they spiralled down. It was an almost vertical spiral, making it a difficult proposition for Cope to stand up. But it produced the desired result—they lost height quickly. As they came down they breathed slowly and gulped frequently to prevent any ill effects from the denser air.

Cope gazed in all directions as the horizon swung round. 'No towns within some miles of us, and the country straight below looks fairly quiet,' he shouted.

Blake nodded his head in answer. Just as Cope was beginning to feel the effects of the continuous spiral Blake put the machine into a side-slip, then dived. Down, down they went. The finger of the speed-indicator moved rapidly up to one hundred and sixty miles per hour. The ground appeared to rise up to meet them. Woods became distinguishable as trees. But these and fields, and an occasional small farmhouse, were the only features of an uninteresting landscape. And as Blake realised this he smiled quietly to himself. There was still a chance, he thought. His pleasurable feelings were rudely interrupted by Cope.

'There's a Hun coming over to us. Shall I fire?'

'No. Don't do anything,' yelled Blake. 'We're just going to land.'

As he spoke Blake slowed the pace of the machine and made his final choice of landing-place. They glided down at a steady sixty, flattened out, and pancaked slightly, for, at the last moment, Blake realised that the ground was rougher than it had seemed. They drew up without mishap.

The Hun machine flew right over to them low down. Cope sat down on the floor of his cockpit with his gun cocked and ready. The Hun must have been a new pilot. He flew directly over them, about two hundred feet up. And, as he passed, the rattle of Cope's gun joined the deep roar of the Mercedes engine. The Hun flew straight through the line of bullets that traversed him from end to end. His machine kept on steadily for a second or two; then her nose went down, and she dived headlong for the ground. The dead pilot must have fallen forward on his joystick. The sound of the crash came to their ears. A second later a sheet of flame

rose from the spot where the machine had fallen. Two minutes later a second fire blazed where their own bus had landed. To the average Hun the wreckage would present the appearance of having resulted from a scrap in the air. The two pigs of Britishers must have fallen out of their machine in the air. Doubtless their bodies were to be found miles away.

## IV.

Fliegen Leutnant Obersturm was on his way back to the aerodrome. He had been out on a balloon protection patrol. It had been a tiresome job. Several times during his two hours' patrol he had been worried by those cursed British pilots attempting to destroy the observation balloons. And once he had nearly been brought down by a scout that swooped down on him. He had barely escaped by diving vertically almost to the ground. Then the balloon came down in flames. He thought gloomily of the strafe that awaited him on landing at the aerodrome. Suddenly he felt a tap on his shoulder. He turned round, and saw his observer pointing to the ground below.

He circled round and looked over. Then he saw the wreckage of two machines, one of them still smouldering. He throttled back his engine and came lower.

Ah! an Albatross scout. And the other—yes, a British machine. He thought rapidly. Here was his salvation. He would land to make certain of the type. Then he would claim to have brought down the Britisher that had brought down the Albatross. And the time? Yes, just when the balloon was brought down. So he would clear himself.

He landed close to the wood near the wreckage. He left his engine running and got out. He spoke to the observer, and they crossed over to the crash. They were so busy trying to identify the type of machine that the two figures that crawled from the wood got into the Hun machine unobserved.

Blake took in the details of the machine at a glance. It was much the same as a captured machine he had seen before. Cope looked over the gun in the observer's mounting. It was simple enough. Blake opened out the Mercédès. They rushed across the ground and rose.

The two Huns beside the wreckage started at the sound of the engine. They swore. Then Obersturm drew his automatic and fired. The bullets whistled past Cope's head. 'Guess I'll test this gun,' thought Cope. He aimed over their heads. At the first crack of the gun they dropped flat. Cope chuckled to himself. Blake, having got a thousand feet in hand, turned the bus south-west. He decided to make for a quiet part of the line.

They were just about to cross, when they saw a British artillery bus in trouble with three Albatross scouts. Blake turned and charged

straight at the Huns. He got right in amongst the unsuspecting scouts, and his front gun spat out simultaneously with Cope's rear gun. Two of the Huns went down—one turning over and over, spinning slowly down in the twisting death-dive; the other a tumbling spume of flame. The third put his machine into a vertical nose-dive. The British artillery bus made for home all out. He had seen enough of Huns without waiting to watch them scrap among themselves.

Blake headed for the lines all out. He crossed at three thousand feet. The British Archies opened fire on him. While he was dodging them Cope leant forward from his cockpit.

'Umpteen British scouts coming down on us,' he yelled.

Blake nodded and shoved the stick forward. The Hun bus plunged earthward in a nose-dive. At a hundred feet up he flattened out again and opened the Mercédès full out. They were travelling at a tremendous pace. The scouts had been well away from them at first. They could not catch them at the pace they were travelling. And the wonderful camouflage effect of the Hun bus made them difficult to pick up so low down. They were too low for Archie.

Birdnesting over the trees, they came to the aerodrome. As they came in sight they could see men running to man the ground machine-guns, others starting up machines. Cope stood up and waved his arms wildly. A machine-gun spat up at them. The crackling bullets tore a great hole in the fuselage behind Cope.

'Damn the blinking idiots!' yelled Cope. Blake shut off the engine to come down. The machine-gun stopped. Little groups of men stood watching them. The Hun bus touched ground lightly in a perfect landing. Blake taxied her up to the tarmac, and switched off.

Lorrie came up to them with a revolver in his hand. Blake put his hand above his head.

'Mercy, *kamarad*!' he bleated.

'Well, I'm!'—ejaculated Lorrie.

Blake and Cope got out. The squadron commander came up. Cope produced the box of plates from his pocket.

'Sorry we had to borrow a bus to come home on, sir; but, you see'—and Blake explained the mystery to an open-mouthed circle.

Just as he finished a scout landed and taxied up. The flight commander got out.

'This is my Hun, sir,' he said to the squadron commander. 'We've chased him all the way here. He must have got the wind up and come down.'

The squadron commander chuckled and pointed to Blake and Cope. 'There are your Huns,' he said, and told the story briefly.

'Well, I'm!'—His tone was the same as Lorrie's. 'Congrats, you two. I thought he was a pretty stout "Hun."'

And in due course Blake and Cope did go to Buckingham Palace in their best field-boots.

## SIR THOMAS PICTON AND FRANCIS HALL

By PERCY CROSS STANDING.

'Life has been called a pilgrimage. It is one in many respects, and the simile is never more applicable than when we make, at certain intervals, a halt in the onward march of our ideas, to revert to the contemplation of times gone by, and endeavour again to bring out the lineaments of events and objects which, like the rich and delicate-carved work of some ancient cathedral, we perceive to be growing daily more indistinct, and in danger of being finally blended into "a mass of things, but nothing certain." —FRANCIS HALL.

'A FAIR, pleasant face, with a twinkle in the blue eyes,' is the not unattractive picture preserved to us of one of the most chivalrous characters and most self-effacing Paladins that ever drew sword in the service of a distressed country. Francis Hall was a Winchester College boy. There he won a prize every year, from 1803 to 1807 inclusive, as well as the Prince of Wales's gold medal for English verse—the subject of this winning essay being the 'Fall of Babylon'—in addition to making and keeping a host of friends. The youthful Wykehamist, his school course completed, went up to Trinity College, Cambridge, in the autumn of 1807. Here young Hall had not as yet taken his degree, when, on 15th June 1810, he became very literally 'a Cornet of Horse.' In other words, he found himself commissioned in the 14th Light Dragoons on the date in question.

Francis Hall was to win his spurs in a good, if a hard, school—the school of Wellington and Picton. These commanders were in Portugal, and were about to commence their memorable pursuit of Marshal Masséna's army, beginning at Santarém and ending at Sabugal. Cornet Hall joined the British headquarters, with a draft of his regiment, in February 1811. From that date until September of the ensuing year he saw continuous active service, including the sanguinary repulse of Masséna's forces at Fuentes de Oñoro, where his charger 'Sancho' received a musket-bullet in the shoulder. The young officer kept a journal, and it makes perfectly delightful reading. The fare provided *en route* was, he says, 'far from despicable—broiled Tagus salmon, roast pork, salad dressed with oil not very rancid, wine, porter, and oranges.' And here is a charming impression of the gallant Sir Thomas Picton: 'I waited on him, as is usual, to inquire his orders. They were such as I was happy to execute, being to dine with him and take a bed in his quarters. They were the first dinner and bed I had met with during the advance, so I did my best both in eating and sleeping. The General's sociable good-humour rendered his hospitality still more agreeable, and now that his talents have been proved, and his praise on earth consummated, I feel pleasure in recalling the simple energy of his manner, which bespoke the resolute soldier, capable of grappling with Fortune for the wreath of Victory.'

A less pleasant picture is drawn of the terrible

atrocities practised upon the unfortunate Portuguese peasantry by Masséna's soldiers during the sullen retreat of the Marshal Prince of Essling. Never, says Cornet Hall, had he seen 'such lines of wretchedness traced upon the human countenance' as in the case of these poor Portuguese. It was a common thing to have to remove the corpse of the murdered owner before procuring a lodging for the night; and 'I remember lodging at a mill, in which we found the miller lying with his limbs drawn up in the writhing attitude of a painful dissolution, both his hands pressed to a wound in the left side, inflicted by a sword or the bayonet.' It is noteworthy that these horrible barbarities were not continued after the French had been driven over the Portuguese frontier into Spain, the reason doubtless being that in the latter country Napoleon's brother Joseph ruled nominally as King of Spain, until finally expelled by Wellington's glorious battle of Vittoria.

On 25th September 1811 Hall was slightly wounded in an engagement at Carpio—so slightly, apparently, that he resented its mention in the *Gazette*; for he writes home: 'By a diabolical blunder, I am afraid you will have seen my name among the slightly wounded; it is true I got a scratch on the 25th, but it was so slight that the adjutant promised not to return me as wounded. He afterwards sent in my name without my knowledge.'

During the winter of 1812 the subject of this sketch was invalided home, remaining in enforced idleness till after Waterloo. In October 1815 he received the appointment of military secretary to Major-General John Wilson, commanding the Eastern District; and in the following year he accompanied Wilson to Canada, that officer having been nominated Administrator and Commander of the Forces there.

And what about Hall's friendship with Sir Thomas Picton, of whose heroic death on the field of Waterloo he heard with the most profound grief? Born in August 1758—some eleven years before Napoleon, Wellington, Soult, and Ney—at Poyston in Pembrokeshire, Picton had been early marked out for a military career. Entering the 12th Foot as an ensign, at what we should deem the preposterously early age of thirteen, he joined his regiment at Gibraltar in 1774, but did not see much active service for nearly twenty years thereafter.

This great soldier's historic leadership of the celebrated 'Fighting Division' of our army in Spain and Portugal commenced with his brilliant share in the smashing defeats of Masséna—Napoleon's '*enfant chéri de la victoire*'—at Busaco (1810) and Fuentes de Oñoro (1811), and

did not cease until Toulouse in 1814. Every schoolboy is familiar with Picton's not less glorious end—how he was seriously wounded at Quatre Bras, but successfully concealed the hurt in order that he might not miss the greater day of Waterloo, and how he fell on that stricken field at the head of his troops, covered with wounds and glory. It has always been recognised that, after Wellington himself, his were the brightest laurels in that brief but bloody campaign of June 1815. In St Paul's Cathedral Picton is commemorated by a monument, his portrait hangs in the National Portrait Gallery, and he was the inspiration of Tom Moore's fine poem beginning, 'Oh, give to the hero the death of the brave.'

Sir Thomas Picton's personal qualities and qualifications have been ably summarised by Colonel Vetch. He was, says this authority, 'warm in his friendships, but strong in his enmities. He had a very strict sense of honour, which would not brook the petty deceptions of society. His manners were brusque, and his speech blunt and without respect of persons. He was a capable administrator. As a soldier, he was a stern disciplinarian, cold in manner, calm in judgment, yet when excited overwhelmed with passion. With the foresight of a born commander, possessing considerable power of combination, strong nerve, and undaunted courage, he proved himself Wellington's right hand in the Peninsula.'

We must now return to Francis Hall, who disposed of his commission in the British Army in 1819 in order to become a soldier of fortune. As he had already 'sampled' the Buenos Aires of the Portuguese capital—the pleasantest part of Lisbon, as he says, 'emphatically' (! 'euphemistically') 'denominated Buenos Aires'—so he was now to sample the Buenos Aires of Latin America. That continent was in the throes of its gallant fight for freedom from the yoke of Spain. General Devereux was engaged in raising his illustrious 'English Legion' for service over there, and Hall placed his sword at Devereux's disposal. The Legion, as is well known, performed prodigies of valour under the leadership of the Liberator, Simon Bolivar. In its heterogeneous membership served Irishmen (including a son of Daniel O'Connell), Englishmen, Scotsmen, and Welshmen. The majority of these were killed, or died of disease comparatively early in the fray; but Hall, who must have possessed a splendid constitution, not only served the new-born Republic of Colombia for fourteen years, but attained the rank of colonel in her service.

Incidentally he received the—to him particularly congenial—appointment of Hydrographer to the Colombian Government. This work led him into a lot of travel and exploration. He scaled, together with M. Boussingault, the famed volcanic heights of Pichincha and Cotopaxi, fairly lowering the climbing record of Humboldt himself, seeing that in the ascent

of Cotopaxi he attained an altitude of some three hundred feet higher than the great naturalist. Nor were the golden possibilities of his adopted country as a field for immigration lost upon Colonel Hall. His facile pen, indeed, embodied his views on this important question in a pamphlet which he dedicated to Jeremy Bentham, who had been much interested in the formation and organisation of the English Legion. And the manuscripts of his journals and 'many excellent plants' were despatched to Dr Hooker of Glasgow, who included them in the *Report of the British Association for 1835*. Ere then Francis Hall had breathed his last.

Ever the apostle and exemplar of freedom under all its forms, his 'extensive and peculiar' South American experiences included an imprisonment of twenty-four hours' duration for sturdily standing up for the rights of a poor blacksmith, whose implements, and therefore his means of livelihood, had been coolly annexed, without any payment or compensation, by the local authorities. The blacksmith's champion won in the end.

Finally, he lived just long enough to be able to endorse the truth of Bolivar's bitter declaration that 'he who promotes a revolution ploughs the sand.' In 1833 Colonel Hall was at Quito, when one of the innumerable revolutions peculiar to South American history broke out. This was the insurrection which developed into the breaking away of Ecuador from the Republic of Colombia. It became Hall's duty, of course, to play his part as a soldier of Colombia, whose troops he assisted to lead in this civil war with the Separatist rebels. Alas! his experience in this new theatre of operations was destined to be brief indeed. On 19th October 1833 he was shot dead in battle at Quito while leading on his men to the attack of some rebel barracks.

Francis Hall was a noble character, and was also, as we have seen, something of a philosopher. 'It is no wonder,' he once wrote, 'that remembrances are guests in whose presence we feel constrained to a more than ordinary sobriety of deportment. Their very entrance strikes a chord of melancholy. They are dwellers among tombs, and bear in their countenances the "pale cast of thought" suitable to those who, while yet in the flesh, hold converse with the departed.'

#### SEA MUSIC.

WITHIN the shell, washed by the ocean's foam,  
The deep sea's music finds a lasting home.  
We hear again the ocean's melodies,  
The stored-up music of the murmuring seas.

So in my heart, as in that ocean shell,  
May all life's sweetest music ever dwell,  
All lovely words and thoughts make one sweet strain,  
Yielding its perfect music back again.

FRANK ELLIS.

## SEVENTH SERIES

### THE FAR EAST IN WAR-TIME.

By G. W. R. MILLAR.

#### I.

THE early morning was sunny and bright as we steamed into the roadstead of Hong-kong on board the Nippon Yusen Kaisha s.s. *Suwa Maru*, a fine ship of just under eleven thousand tons, bound for Japan, and the last addition to the Japanese mail line. But as the passport and customs officers left us, and while we were still waiting for our pilot, the weather suddenly changed; rain began to fall, a high wind rose quickly, and in a very short time the junks in the bay were making heavy weather. We had visited Hong-kong before, in the early summer of 1913, when returning to Scotland from the Far East by way of Korea, Manchuria, and the Trans-Siberian Railway. But the times were changed now, for it was the end of the third year of the Great War, and the first thing that struck us was the much smaller number of ships now in the harbour of Hong-kong, and that none of those which were there flew the Union-Jack, which was a change indeed from the conditions of four short years ago! But still the British Empire was, after all, not left wholly unrepresented, for ere long a very smart new Australian destroyer came along in fine style, and our hearts were rejoiced once more to see the White Ensign flying at her stern.

As the day advanced the weather cleared again, and the wind fell. We decided to visit the peninsula of Kowloon, on the mainland, the extreme point of which was ceded to Great Britain in the year 1861, and is now incorporated in the Government of the island of Hong-kong. To most people Kowloon is just a flat place on the map, whereas it is in reality a hilly and mountainous country. We succeeded in hiring a motor-car, and drove eastward along the bay, and thence inland for about twenty miles in all, until we had entered Chinese territory; and then we drove back again. Somewhat to our surprise, we found ourselves touring along a first-class military road, which pierced various passes through hills covered with fine trees. This road twists and turns round bends in the hill-sides, so that we came quite suddenly upon magnificent views of mountains and valleys, with ever and anon glimpses of the open sea,

and of arms of the sea studded here and there with islands, like gems in a wondrous setting. And above were the sun and sky of the mysterious East. As in Ceylon and Japan, every available piece of flat land bears a crop of rice, millet, or vegetables, and ploughing with buffaloes is in progress on many of these flats between the hills; while fishing-villages abound as we approach the shores of the bay. The railway from Hong-kong to Canton passes through a series of tunnels in the hills on this portion of its route, and runs in part alongside the military road we have mentioned. This railway, when joined up with Hankow on the Yang-tze, will enable people to travel direct from Hong-kong to Flushing by rail—that is, of course, after the war, and when things resume their pre-war conditions, if they ever do so again!

As there is apparently an endless quantity of granite in this part of the world, most of the houses, including even the poorer native ones, are built of well-dressed stone; and, of course, all the public buildings in the city of Victoria, the capital of the island, many of which are very fine, have been erected with this material. In some respects, therefore, Victoria, with its surroundings, usually referred to under the generic name of 'Hong-kong,' may claim even to rival the famous Aberdeen itself, as 'the Granite City of the North-East.'

About twelve miles on our way across the Kowloon peninsula we came upon a European settlement, with numerous villas, situated on a hill overlooking a fine bay. Most of these villas are owned by merchants or other residents in Hong-kong, who prefer to reside there to living in Hong-kong itself, to which they can travel daily either by train or steam-launch. Several launches, as well as yachts, were lying moored near the jetty in the bay beneath us.

As we returned in the evening over the pass in the hills which looks down on Hong-kong, the city and the shipping in the harbour were beginning to light their lamps, and by the time we reached the level the whole town and harbour were ablaze with lights, mainly electric. Viewed from the Kowloon side, with the great inhabited hill known as 'The Peak'

—which rises immediately behind the town—as a background, this presents a very fine and, indeed, striking spectacle.

We sailed early next morning, and, after creeping through fog, we reached Woosung, at the mouths of the Yang-tze, about noon, and passing up the great river, we in due time 'made' Shanghai. The first views of Shanghai from the Yang-tze show, among other things, a forest of tall chimneys pouring forth volumes of smoke. These belong to the numerous cotton and silk mills with which the town abounds. The actual approach to Shanghai by water is, in not a few respects, similar to that of London by the Thames, for each has its crowded shipping, and its lines of barges, tug-boats, and the like moving up and down its great river. At this side of the world, however, it seems impossible to realise that the greatest war in history is proceeding now, and has been for the past three years. The place is a busy hive of peaceful industry, and the only sign of war is furnished by two or three large Austrian steamers lying in the river, these having been interned by the Chinese Government. Certainly Shanghai is, in many ways, as rushing and noisy as London itself. Carriages, motor-cars, motor-lorries, drays, and rickshaws all take part in the crowded traffic, which has to be regulated by the police at all crossings. These police are tall and robust-looking men from north China, who wear blue uniforms, and are particularly efficient at their work. There is another respect in which Shanghai is remarkable at the present time. It is, perhaps, the only important town in the world where there is a large number of British and German citizens who meet day by day, but who are nevertheless obliged by the exigencies of time and place to maintain toward each other the semblance at least of a peace that is admittedly not in their hearts, and which is probably at best but a state of armed neutrality. This of course arises from the fact that Shanghai is an open port, and that the business quarter is situated in neutral ground, while each nation has its own Concession where its subjects reside. The German Concession contains the Teutonia Club, one of the finest buildings in Shanghai; and at the time of my visit the German flag was still flying over it, while above the door was a large replica of the national eagle in bronze. The Chinese do not seem to mind these things much, for they had then already broken off diplomatic relations with Germany; and, although war had not at that time been declared by China, the Government had nevertheless seized all the German ships in their harbours, and even now they were busily engaged in fitting them out for trading again on their own behalf! This is quite characteristic of the Chinese and their ways.

We hired a motor-car and drove round Shanghai and its environs. The country around

is very flat, and quite different from mountainous Hong-kong and Kowloon. It is, in fact, very similar in character to Holland, with numerous canals intersecting the land, many of these being considerably below the level of the fields, so that only the tops of the sails of the barges were visible. On others there are regular towing-paths raised slightly above the level of the canal, and members of the families to whom the barges belong might be seen towing them laboriously along.

The Chinese are great agriculturists, and every available square foot of ground seemed to be under cultivation, the crops being mostly one or other of the five chief cereals grown by the Chinese—namely, rice, wheat, barley, millet, and beans. But there are also acres of vegetables in addition, including sweet potatoes, egg-plant, and lettuce, all of which are highly esteemed. The European houses in the suburbs are for the most part built on the models of detached houses in England. Many of these are large and handsome buildings, mostly half-timbered and red-roofed; and all, or nearly all, have a garage attached, as every person of any note or position here seemed to possess a motor-car. The gardens are also well kept, with roses, hollyhocks, and many English flowers growing in them, while ivy and Virginia-creeper flourish and abound.

Coming back into the city in the evening, along roads lined with trees, and with brick walls separating the houses of the European residents from the road, with the clanging of the bells of electric tramways, and numerous motor-cars passing up and down, one is more reminded of the surroundings of a European city than of one in the Celestial Empire. And in the heart of the city itself the scene is, in the evening light, quite a brilliant one. The business houses are now closing up for the day, and, as fully three-fourths of the population moving along the streets wear long, close-fitting clothes of pale blue, dark blue, or other distinctive hue, there is quite a kaleidoscope of colour. Certainly animation in its life, combined with business bustle and prosperity, is written all over Shanghai.

Persistent fog-banks trouble us again after leaving Shanghai, and the steam-whistle goes very frequently, an unpleasant accompaniment of voyaging both by night and day. But at length we reach Kobe, and set foot once more on the sacred soil of old Japan, so long a closed and forbidden land to the European, and still, as regards both itself and its people, one of interest and mystery. But it is also in many places a land of surpassing picturesqueness and beauty, and a country which in a comparatively brief period of time has passed through many stages of political, commercial, and industrial development, and has assimilated many Western ideas in a way which, for a purely Oriental people, is truly astonishing.

## II.

Our first objective on the occasion of this visit to Japan was the mountain resort of Chuzenzi, and there we put up at the Lakeside Hotel, owned by a gentleman of the typical name of 'Sakamaki Show.' Lake Chuzenzi is situated about four thousand two hundred feet above sea-level, and is surrounded by hills and mountains. In some respects its general appearance is not unlike Loch Katrine, only the mountains are higher; and although this is now the month of July, the air is here quite decidedly cold, while at the lower levels of Tōkyō and elsewhere the temperature is at summer heat. During our last visit to Japan it was the time of the almond and cherry blossom; and the sight is one which can never be forgotten, just as it is a delightful experience to pass over the great Siberian plains in May, when they are covered with masses of wild flowers. But now in high Japan the ground is everywhere ablaze with flame-coloured azalea-bushes, the wild rhododendron, and the purple iris—the last-named in this high altitude growing low among the grass, much as the hare-bell does in Scotland. The air is clear and fresh, although fine days seem only to alternate with those of mist and rain. Chuzenzi is fast becoming a fashionable resort, and by the end of July the hotel, which accommodates over one hundred people, will be quite full. Various Tōkyō magnates have built themselves villas along the lake-side, and the British and other foreign embassies make it their summer quarters in the height of the hot-weather season. The lake is well stocked with trout, although they are not much disposed to rise to the fly, which is probably due to its high altitude. But in a small but rapid river which runs from Lake Utomoto down to Lake Chuzenzi, and has a fall of about eight hundred feet in six or seven miles, we did succeed in getting some trout to come to a relatively large and roughly dressed fly, which we acquired from a gold-bespectacled gentleman in flowing robes, who is in charge of the Government Fish-Hatchery after-mentioned. The great fall of the stream in so relatively short a course naturally makes it very rapid, and there are several large waterfalls; but there are fortunately also about two and a half miles of flat plateau land, where there is some quite fishable water, although the trout do not, on the average, run large. The Government, however, maintain a fish-hatchery at the point where the stream falls into Lake Chuzenzi, and there American trout (*Salmo fontinalis*), as well as Rainbow and Japanese trout, are raised. This will no doubt materially improve in time the size and quality of the trout both in the lake and the river. For the very reasonable sum of one yen—which is equal to two shillings and a penny of our money—I was able to obtain the necessary Government fishing per-

mit, together with the use of a ten-foot cane rod, a reel, a line, gut, and two flies. But fishing in Japan four thousand two hundred feet above sea-level has also its drawbacks as well as its charming and picturesque surroundings; for the water, being still snow-laden, is very cold for wading; while as soon as the sun comes out in power the fisherman is immediately beset with thousands of midges, also horse-flies and other forms of the fly pest.

Chuzenzi is situated two thousand feet above the railway station at Nikko; thereafter the route is partly by an electric tramway, and partly, from its terminus, up a very steep and winding path, either by rickshaw manned by two men—one pulling and the other pushing—or by walking. The traveller's luggage is carried up by pack-horse, and strings of these are continually passing up from Nikko with personal belongings and food for the hotel and the surrounding villas. The hotel is conducted on European lines, for the typical Japanese hostelry—with its almost entire want of furniture, its rooms divided from one another only by paper screens or panels, its sleeping accommodation (a mattress on the floor), and its dining-table about one foot high—does not yield the acme of comfort according to Western ideas; while there is little privacy for the traveller within, and much noise without.

The observant sojourner in Japan will, however, find much to see, and a great deal to learn. One thing which impressed itself deeply on our minds was that the Western Powers now in the death-grapple—alike on the fields of France and Flanders, on the Italian mountains, in the tangled wilderness of the Balkans, on the plains of Mesopotamia, and in the deserts and hills of Palestine—will have to reckon with a very real and rising Power in the Eastern Seas, when the questions of commercial supremacy and of the return of our trade with the East become again, after the war, matters of the first practical importance.

The conclusion of the war should see, as speedily as possible, a return of British strength and prestige in the Far East if we are not to lose our commercial and political as well as our social influence in China, and even in Malaya, before the intensity and driving force of our Allies the Japanese. In them we must recognise the existence of a nation who have for long been highly civilised—far more so, indeed, than many parts of Europe; of a country where not only do great cleanliness, order, and industry prevail, but where extreme cleverness, adaptability, and scientific attainment exist. Moreover, they are a people having a rapidly increasing birth-rate, and possessing a numerous, strong, and healthy population, resident as small-holders on the land, and not confined, under unhealthy and enfeebling conditions, in crowded cities and centres of population, as is too frequently the

case in this country. Hitherto Japan has, in comparison with many European countries, or with the United States, lacked money, and the resulting power to extend and develop its industries and promote its commercial interests. But there can be no question that it has profited financially by the war in an astounding measure; and any traveller through the country in recent times must have observed that factories and great public works are arising everywhere, and that powerful electrical plant is being largely installed in many places. But with all this modern development in industry and commerce, adapted no doubt and assimilated in large measure from both Europe and America, their high sense of patriotism and of pride in their own country and its history have impelled the Japanese still to retain most of the distinctive characteristics and features of their race—their national costume, house architecture, social and religious customs, and the ways and manners of their own people—unspoiled by contact with European ideals. Tōkyō is in itself a revelation to the traveller. With a population of nearly two millions, it now covers an area about two-thirds that of London, this being largely due to the houses being for the most part of one storey only. The main streets of the Ginza and Nihonbashi quarters of Tōkyō, which are continuous and extend for about two miles, are crowded with first-class shops constructed on the European plan, and include a large emporium similar to Harrod's. These streets are as wide as Oxford Street, and tree-lined; and at night, when blazing with electric lights, with electric cars passing up and down, and crowded with people, they resemble, but for the differences in costume and race, the main thoroughfares of any of the great European capitals. But racial differences and the difficulties of the Japanese language must prevent anything more than a comparatively superficial acquaintance at best with this clever and curious, yet exceedingly polite, people. Moreover, their ways are not our ways; their religion is essentially a thing by itself; and to them we must seem, as a nation, aggressive and ill-mannered when judged by their own standard of bearing and manners. On the other hand, truth compels us to say that many people who have had business transactions with them express some doubt as to whether their standard of commercial dealing is always on quite as high a level as their politeness and good manners; and, while comparisons are odious, I know it is felt all over the East that, strange as it may seem, the Chinese merchant of good standing frequently maintains, in this respect at least, an acknowledged priority.

It is said that a Japanese returns to his country after residence in Europe more impressed than before with the virtues of his own nation, and more full of patriotism than ever; and certainly, with all their faults and failings, there is much to be admired and respected in Japan and its people. I have seen them, for instance, both on ordinary days and on feast-days and holidays, and I have never come across a cleaner and more orderly and well-behaved race. In the Park of Yokohama on the 1st of July last—which was, I believe, the anniversary day of the opening of the port—I saw great crowds watching the Geisha dances, the daylight fireworks, and other national forms of entertainment—all clean-looking and well-dressed, and these were the poor! There were also troops of children, all healthy-looking and strong-limbed, bright and merry, and clad in fresh, washable garments. Climate and environment may no doubt have a good deal to do with it, but I could not help contrasting these things with what one would almost inevitably expect to see at home on the occasion of any similar public festival. The same spotlessly clean and fresh conditions apply to their houses, and also to their theatres and other places of public resort.

Of course, at this time of day one does not need to speak of the wonderfully artistic instincts of the Japanese, and especially of their peculiarly delicate sense of colour and the blending of colours, or the excellence of their workmanship, particularly in ivory, bronze, brass, cloisonné work, china, and cabinets. All that is well known, but still it is a revelation, and a fascinating pursuit as well, to visit the curio-shops of Tōkyō and other places in old Japan, and to see in them so many fine examples of Japanese art, both ancient and modern.

What the future of Japan will be it is impossible to foretell. The country will no doubt have its troubles to face, especially if socialistic and revolutionary ideas take any serious hold upon its people; and there may be financial difficulties as well if, as at present appears not unlikely, the nation should drive too quickly ahead in the way of industrial and commercial development; for there is a danger of its being carried away by the specially fortunate position which it now holds in the existing state of the world's affairs. But it is difficult to believe that a nation possessing inborn intelligence, capacity for progress, and a love of industry, determined to advance, and patriotic to the last degree, will readily be brought to any serious stop in the path of its development. And it seems to me that its emblem of 'the Rising Sun' has been well chosen.

## THE FORESTER'S GIRL

CHAPTER XVII.—*continued.*

LIKE an inspiration, the sight of Anita's suddenly glowing face awoke in Gavin Barrie a thought, chaotic but definite, a fragment of one of the Psalms he best liked when, as a boy, he sang in the school choir: 'Thou, Lord, hast made me glad through Thy works.' This girl beside him—she could and should be happy, for was she not already tasting the pure joy that is the gift to all such as turn to Mother Nature for comfort and companionship? Not for him was it to put a stumbling-block in the new path she had begun to tread, but rather to lend his strength for her to lean upon, to help her to learn the lessons for which she seemed so apt a pupil.

Answering promptly to her new mood, he dropped the artificial rôle he had assumed, and said in his old, friendly fashion, 'Wild geese! Well done, Anita! You saw them before I did. I expect by this time you could tell me lots of things about the wilderness world that I've not yet discovered. See!' he exclaimed, suddenly stooping; 'here is a feather from one of their wings, dropped almost at your feet. Let's put it in your hair!' and in boyish fashion he wove the quill among the glossy strands of her hair. 'There!' he exclaimed; 'with your black hair and feather you look like Pocahontas come to life! And now, tell me about your life up here. You're not afraid of the forest any longer?' he added half-quizzically.

A little ripple ran over Anita's face, and a smile danced in her eyes. 'Oh no!' she laughed. 'These'—and she waved her hands towards the thick-standing trees—are all my friends now; only, they never return the many calls I pay them.'

'That's much the best kind of friends,' commented Barrie—'the kind one can always go to, and are certain of finding at home. Can you tell a balsam from a fir yet, and a bull-pine from a sugar one?' Then he talked of the flowers and the birds, and thus by degrees drew from her pretty much just how she had spent these first two months of her new life. Evidently her husband had been constantly with her, and she had not been actively unhappy. Was she, then, quite content, and her heart satisfied as the forester's wife? That light suddenly kindled in her splendid eyes and shining like a beacon to his own soul when they faced each other at the turning of the road—was it solely surprise and the glad welcome of friend to friend?

Thus pondering, he fell silent while Anita prattled to him of the colony of woodpeckers that infested the trees round about her home; how gay and how saucy they were; and how, when she first went to live there, their persistent

rat-tat-tap-tap woke her at dawn; but now they were all going away South, so David told her, and she would miss them sorely; and again her face took on the wistful expression which Gavin had already noticed. But before he could shake off the preoccupation of his thoughts and reply, Anita suddenly stopped, and pointing to where, from the roadside, a faintly defined trail led into the thicket, said, 'This is where we must part. That is the trail to Goose Lake. I have never followed it myself, and David says it is not very good; but you will have the sun overhead, and plenty of light to see it.'

She stood, irresolutely holding out her hand; while Gavin Barrie, acutely aware how loath she was to say good-bye, felt a wave of gladness surge through him.

'Oh, but, my little Anite,' he said gaily, 'I'm not going to leave you here. I shall see you home, if I may, and fetch that bread of mine.'

But at these words every vestige of colour fled from Anita's face, and a look of fear crept into her eyes. 'Oh no, Mr Barrie!' she exclaimed, with difficulty steadying her voice. 'You must not! Please wait here, and I will bring the bread; or David will take it to you to-morrow. He is away from home just now.'

'Nonsense, Anita,' expostulated Gavin, preparing to walk on. 'Of course I shall fetch the bread myself, and, in any case, see you home. How do I know that you can find your way?' he asked with an attempt at badinage.

'*Mais non, m'sieur!*' cried the girl, suddenly breaking into French; and darting towards him, she threw herself on his breast, and, folding her hands in supplication, said beseechingly, '*Je vous implore!*'

Encircling the trembling girl with his arm, Gavin tenderly smoothed back from her white forehead the soft waves of hair, and looking steadily into the wide, frightened eyes, said gently, 'My little Anite, have I wronged either yourself or your husband in word or deed that you should forbid my coming to your own door?' Then, with a touch of sternness, 'Would you wish me to glide away into the forest like some mean reptile that has invaded David's paradise, while you yourself hide from him the simple fact of our having met this morning by merest chance? Come, *petite*,' he continued, quietly freeing her; 'let us go on. Can't you see that it would be as great a wrong to David as to yourself to give him any reason to suppose I dare not face him or cross his threshold?'

'Oh, you do not understand!' moaned the girl, yet, obedient to his will, moving on slowly, while Gavin, walking by her side, strove to reassure her.

'Be sensible, Anite. David knows that I have as much right as has any one else to camp on Goose Lake. Indeed, he has probably already heard so, and knows that I am not there to interfere with him.'

Thus reasoning, they reached the cabin, and though somewhat appeased by his words, it was nevertheless with no slight relief that she found the key in its hiding-place, and the forester still absent. At her invitation, a little shyly given, Barrie entered, and at once noted the unlighted stove. 'Anita!' he exclaimed, turning to the girl, who, white and weary, had sunk into a chair. 'Do you mean to tell me you have had no breakfast?'

Anita flushed; she could not bring herself to explain why she had felt constrained to flee out of the silent house into the cheering influence of 'all out-of-doors.'

'Please sit where you are,' Gavin bade her as she started to rise. 'I'll light the fire. I can surely do *that* much for you; and I see it is all ready laid, practical housekeeper that you have become!' he said cheerily, determined to keep Anita's mind diverted.

'David laid it,' she admitted, flushing a little.

'David, eh?' responded Gavin. 'David's a good boy!' he added lightly, striking a match. 'Now where is the coffee-pot? There? I say, but you keep it bright as silver! You should see ours at the camp—black as coal already!'

'That's David's job,' said Anita. '*He* scours all the pots and pans—to save my hands,' she added in an undertone.

Gavin's sensitive ear detected the faintest suspicion of conjugal pride in the statement. If Anita did not yet love her husband, he, Gavin, must help her to do so. 'Umph!' he grunted; 'I'm afraid an Englishman would consider the scrubbing of the pans was a woman's work, and he would sit and smoke,' he went on, callously maligning his countrymen.

'That isn't the way with Americans,' commented Anita, with the first touch of spirit that Barrie had yet called forth. '*Our* men try to spare the women all the hard work they can.'

'Do they?' queried Gavin sardonically, deliberately driving another nail in his own coffin. 'Glad, then, that I'm not an American. Were I married I should expect my wife to do all those things, and not to think about her hands!' No reply from the hearer, but two small red spots suddenly burned in her cheeks. 'Now where shall I find a cup and saucer?' he asked when the coffee was brewing. 'Did this exemplary David wash his own breakfast-dishes too? I can't see even a spoon lying about!'

'I'm afraid David didn't *have* any breakfast,' she replied rather shamefacedly, yet with a stir of pride in her voice. 'You see, he had to go out very early, and—and—he didn't waken me to get his breakfast; not even a cup of coffee.'

David is very good to me,' was added in a half-whisper.

Then, going to the cupboard, she brought out a ham, and asked Gavin to cut it, explaining that David always sliced it for fear the knife might slip and cut her fingers. And so it was throughout all the small preparations for Anita's breakfast; it was David did *this*, and David who did *that*, and at each admission her guest expressed surprise and admiration, or rallied the young housekeeper good-naturedly, until she herself began to feel uncomfortably conscious that the tables were turned, and that in their marital relation the forester shone in the eyes of the Englishman to better advantage than did she.

Refreshed by the meal and cheered by Gavin's insidious praise of her husband, the unreasoning fears that early in the morning had so possessed her began to seem foolish and fantastic; while Barrie's frank ease, the friendly contact of the red-brown dog leaning against her knee, and the strange combination of circumstances which had brought them thus together in her own home lessened a tension that might have otherwise proved intolerable.

Presently Barrie lighted a cigarette, the action at once recalling to Anita's mind David's self-denial on that point and his remark about 'useless toffs.' But now, thanks to Barrie's subtle bending of her mind, she found herself unexpectedly begrudging him a luxury David would not afford; so that when, glancing about for sign of pipe or tobacco, Gavin remarked inquiringly, 'Then your husband doesn't smoke?' she answered, with heightened colour and a small spark in her eyes, 'No; he is *saving*, so as to give me a better home some day.'

'Ah,' murmured Gavin, deliberately sending home still another nail in the coffin he was building for himself, 'I'm afraid that is more than I could do for *any* woman. Better be a bachelor and smoke than a married man and forswear one's tobacco! *Mais à chacun son goût!*' he ended lightly, blowing a series of smoky rings and idly watching them float away.

Anita, too, watched them in thoughtful silence. Somehow to her seeming Gavin Barrie's speech did not ring true. Him she had the best of reasons to know to be good and generous. Then why masquerade in a cloak of cold selfishness?

And possibly before long she might have divined his real motive had he not abruptly risen from his chair, and tossing through the open door the end of his cigarette, said carelessly, 'Come now, "Bob," you and I must be getting back to Goose Lake or there will be no fish-heads for your supper to-night!—And may I have my bread?' he asked, turning to Anita.

Without answering, she fetched the loaf, wrapped it in paper, and handed it to him, on her guard not to meet his eyes.

'Good-bye, little Anite!' he said, pausing, hat in hand, in the doorway. 'Sure you are not

afraid to be left alone?' he asked kindly, a mad hope tearing at his heart that she might bid him tarry. But Anita merely shook her head, smiling such a woe-begone little smile that Gavin felt his own courage failing, and made haste to retreat; then, suddenly turning, he caught both the girl's hands in a fierce grip. 'Promise me you will be happy, Anita—happy because of all this!' and he motioned towards

the wild green world, now glowing with mid-morning radiance.

'Yes, I promise,' whispered Anita, and watched him go, his boon companion careering joyously before him. Blue and crimson flashed a jay across the road and vanished among the trees. Alone, yet unafraid, among the great silences stood the forester's girl.

(Continued on page 327.)

## FRUIT-GROWING IN THE CAPE PROVINCE.

By JAMES PATERSON.

**W**ITHIN a radius of one hundred and thirty miles from Capetown are situated the fertile fruit-growing districts of the Cape Western Province, where some of the finest deciduous fruits in the world are produced.

Quite close to Capetown itself is Wynberg ('wine mountain'), the slopes of which are covered with vines yielding during the months of February, March, and April many hundreds of tons of grapes; and, owing to the South African markets being limited, and the export trade not yet established on a firm basis, the Capetown residents and visitors are able to purchase first-class grapes in the season at one penny or three-halfpence per pound.

In the Stellenbosch district (thirty miles from Capetown) some of the finest fruit-farms in the province are to be found, particularly those owned and worked by Lord De Villiers, the Rt. Hon. John X. Merriman, and Sir Thomas Smartt. Here the soil is peculiarly adapted for the successful growing of peaches, nectarines, Japanese plums, pears, and apples; and at least one enterprising farmer, with a ridiculously small acreage, made two thousand pounds from fruit exported by him to England during a recent season extending from December till about March. Irrigation is not resorted to, as the rainfall during the winter months drains from the surrounding hills, and soaks into the valley where the fruit is grown.

A few miles west of Stellenbosch are located, in the valley bounded by the Groot Drakenstein range of mountains, a group of farms acquired by the late Cecil Rhodes about twenty years ago, when up-to-date methods of fruit-farming were in their infancy, his idea being to demonstrate that with scientific management and a moderate outlay of capital the attainment of profitable results was quite an easy matter. Several years had to elapse before the thousands of fruit-trees planted on these farms could reach the producing stage; but in due course the trees came into bearing, with the result that large jam and canning factories are now kept amply supplied; the local and inland markets are so well catered for that the price of fresh fruit during the season is kept at a low figure throughout South

Africa; while, owing to the cargo restrictions of war-time, the management have recently been at their wits' end to know what to do with the balance of their crops. A few years ago a continued spell of more than usually hot weather brought the plum crop in this valley to maturity with unexpected quickness; and, after all the available outlets had been taken advantage of, two or three hundred tons of large, luscious plums had to be buried in the ground.

Situated a few miles on either side of Groot Drakenstein are the French Hoek and Paarl districts, where large quantities of grapes and hard fruits are produced, the farms almost invariably belonging to descendants of the original settlers, many of whom were French Huguenots, as their names—e.g. Hugo, De Villiers, Le Roux, Du Plessis, and Du Toit—testify. On many of these farms are to be seen Bibles and relics brought from France during the Huguenot persecutions several centuries ago.

The Wellington district (forty-five miles from Capetown) is noted for its apricots, the soil there being well suited for the growing of this fruit. Here, also, Mr Rhodes purchased a number of farms for the purpose of demonstration; but with the exception of one or two they have since passed, in accordance with the original intention, into private hands. An Englishman who settled in the Wellington district fifteen or twenty years ago, with no practical knowledge of farming and very little capital, has made his farm one of the most up-to-date and profitable. The ground he acquired had been so notoriously unproductive that his neighbours were very pessimistic regarding his prospects; but, being energetic, intelligent, and enterprising, he set about breaking every known local precedent, making free use of dynamite to blast out old roots and open up the soil, with such successful results that now only first-class fruits are grown, and his farm is looked upon as a model of what a fruit-farm should be.

South of Wellington, the fruit season begins to slacken off in February; but in the Worcester district (one hundred and ten miles from Capetown), and in the Hex River valley, which runs north of Worcester for a distance of twenty

miles, the season only commences in that month, and continues till May, when the deciduous fruit season in the Cape Province definitely closes. While all descriptions of hard fruits are grown in the Worcester and Hex River districts, there are also extensive areas under vine cultivation there, and the local growers are particularly favoured in that they have practically a monopoly of the markets during the latter part of the season. During the months of March, April, and May the daily quantity of grapes despatched from these two districts to the coastal and inland markets of the Union of South Africa averages about fifty tons, while in normal times considerable quantities, limited only by the ships' cold storage accommodation, are exported to England.

The two largest fruit-growing concerns—namely, Rhodes Fruit Farms, Limited, at Groot Drakenstein, and the Cape Orchard Company, Limited, in the Hex River valley—possess cold-storage chambers, which they fill with the harder varieties of fruit (apples and pears) during the season, and are thereby enabled to place a limited supply of summer fruit on the local markets throughout the winter at enhanced prices; but the softer varieties, such as grapes and peaches, cannot be kept satisfactorily for long periods in the ice-chambers.

During the past few years a commencement has been made on a fairly large scale to dry fruit, and this industry is making good progress. Several jam and canning factories have been established during recent years, but there are still opportunities for more enterprise in this direction.

Enormous quantities of grapes are utilised for wine, brandy, and grape-juice making; but the farmer seems unable or unwilling to retain the products for the long number of years necessary to bring them to full maturity. The grapes are usually carted in bulk in high-sided wagons from the vineyards to the distilleries; over rail journeys they are contained in old cement casks, and on arrival at the winery they are shovelled into the still. When troop-trains were being moved about the Union some time ago, the soldiers were on the look-out at crossing-places for the trains conveying grapes in bulk, with the result that many of the casks reached their destination more than half-empty.

Many of the more progressive fruit-farmers endeavour to market their own produce; but some coteries of Dutch, Indian, and Greek dealers act as middlemen between the growers and the town buyers. These middlemen pay to the farmers, say, seven shillings and sixpence per hundred pounds of hard fruit, and three to four shillings per fifty pounds of grapes, or they buy a farmer's entire crop for a fixed sum, sometimes named and accepted quite at random; and the only trouble the farmer then has is to cart the fruit to the nearest railway station or to the middleman's store. The middlemen require to buy

largely, and they run a risk of losing money, as when crops are heavy and ripen quickly the South African markets are apt to be glutted, and a fifty-pound basket of grapes, costing the middleman about five shillings to place it on the Johannesburg or other inland market, may be sold to the wholesale buyer for half that sum.

The old-time reluctance of the original settlers to sell any portion of their extensive farms is now not so great, and large areas of ground are held, awaiting buyers, by the various land companies. Good fruit-producing land is worth from twenty to fifty pounds an acre, and a plot of from five to fifty acres is sufficient for a beginner to start with. During winter-time—from June to November—the ground should be cleaned, the fruit-trees should be sprayed and pruned, old and useless trees and vines should be rooted out, and substitutes planted, and the summer's stock of fruit-boxes and baskets should be laid in. Throughout all the fruit-growing districts, thousands of new trees and vines are coming into bearing yearly, far outnumbering those discarded as too old or infected with disease; and additional extensive plantings continue.

Year after year the South African markets become overstocked with the local fresh fruit, so that what is wanted is a large market outside the Union, and the Cape fruit-growers look to the United Kingdom for such a market. During the 1913-14 season about five hundred thousand boxes of deciduous fruits were exported from Capetown to England, and during each of the two following seasons about half that quantity was exported, the reduction being due to the irregular sailing of the mail steamers and restriction of cold storage accommodation therein. Of course, the best of the fruit is selected for export. Of the hard fruits, only those unblemished and of proper size are taken; while all the grape-bunches require to be trimmed, the soft and unsuitable berries being snipped off. Single-layer boxes to hold from eighteen to twenty-four peaches, plums, pears, or apples are used, and with the wood-wool packing they weigh from six to ten pounds. A larger size of box is used for grapes, ten to twelve pounds of this fruit being placed in each box, which, with the wood-wool packing and a heavier type of box, brings the total weight of each box to about fifteen pounds.

There is a tendency on the part of exporters to expect too high a price for their fruit, and this in part may be explained by the comparatively limited quantity handled. White managers or supervisors demand good salaries, but native labour is cheap, so it follows that an increased output would mean a comparative reduction in working expenses. A bright future is in store for the industry, and the Rt. Hon. John X. Merriman predicted that the time would come when grapes in full shiploads would be sent from Capetown to Europe. Before this can be done, however, the Cape farmer, instead of expecting anything

up to fifteen or twenty shillings for each fifteen-pound box of grapes, will have to be content with four shillings and sixpence or five shillings, at which price the retailer in England and Scotland should be able to supply 'the man in the street' with grapes, equal or superior in quality to the local hothouse variety, at not more than one shilling per pound. Increased production and ample marketing facilities in Great Britain, the Continent, and probably the United States of America will render the lower price more than adequate.

Not long ago the farmers of Bathurst, South Africa, who abandoned ostrich-farming in favour of the cultivation of oranges and pine-apples, were supplying London with pine-apples at sixpence each. In 1915 the Bathurst plantations yielded almost thirty millions of pines, in addition to large quantities of apples, lemons, and tangerines. The State railways agreed to carry the fruit grown by members of the

Bathurst Farmers' Union to the docks at fifteen shillings a ton, a reduction of thirty-seven shillings and sixpence a ton on a six-hundred-mile journey. The Union Government made arrangements with the Union-Castle Line to take the fruit from Capetown to Tilbury at twenty-five shillings a ton. The export of dehydrated fruits had also begun, while oranges from Natal and the Transvaal arrived in London at a time when the products from other plantations were not available. All this activity, however, has been checked by the limitation of cargo space.

When the war ends, and many of our returning citizen soldiers yearn for a continuance of that open-air life to which they had been accustomed for a few years, what more pleasant and profitable occupation could they find than fruit-farming at the Cape, or assisting to open up European markets for the sale of some of the choicest of the world's fruits?

## A LITTLE SHIP.

### CHAPTER II.—COMMISSIONED.

#### I.

WE have now been in commission for some months. The time is 4.15 pip emma; the season, the early part of winter; and now, having finished tea—which meal, so far as I am concerned, consists of a piece of ship's biscuit and a cup of liquid of a rich burnt-sienna colour, the acidity of which would dissolve a tenpenny nail—I am at liberty to retire to my cabin to start this second chapter.

We have food at peculiar hours on board ship. Lunch is at twelve noon, and tea at half-past three; and the latter meal, from my point of view, is a fraud, a delusion, and a snare. The sub. and the doctor, however, seem to enjoy it. They defy the Food Controller by eating hot-buttered toast camouflaged with jam and potted meat, also slabs of solid-looking 'Scotch bun' sent for their delectation by one or other of their sisters or female cousins, who seem to think that they are half-starved. I, not having a sweet tooth, do not indulge in such gormandising.

The weather is pestilential, and through the open scuttle over my writing-table I can hear the shrill whistling of the wind, and the swish, slap, and gurgle of the seas as they go racing by. It is blowing hard; while ever since the early morning, when the needle of our aneroid started to go backwards with some rapidity, it has been snowing, raining, and sleeting at irregular intervals. The temperature on deck, as some one tritely observed, is enough to freeze the tail off a brass monkey. I am only too thankful that we are not at sea.

Every now and then I can feel the ship quiver

and tremble as a particularly strong blast catches her and tautens out the cable which secures us to the buoy. We have an anchor watch set and steam up for slow speed lest anything should carry away and we should start sailing merrily down the harbour amongst our closely packed friends to leeward. I sincerely hope that nothing will part, for I, for one, do not fancy playing battledore and shuttlecock in a crowded anchorage in a gale of wind and the short winter afternoon drawing in.

I spent the afternoon in a folding-chair in front of a blazing stove. I started off by reading a book, until, very soon, my thoughts overcame me and the volume dropped with a crash. I let it lie, and continued to think. Then a heavy, sea-booted gentleman started to walk ponderously up and down, up and down, on the thin deck overhead, varying the monotony every now and then by a few steps of a double-shuffle to keep his feet warm. I have every sympathy for cold feet, but evidently the sailor on the roof did not realise that a destroyer is little better than a hollow steel drum, and that I, so to speak, am one of the cockroaches living inside that drum. At any rate, his peregrination sounded like the triumphal progress of an elephant battery and the Lord Mayor's Show all rolled into one; so I roused myself, went on deck, and asked the cause of my affliction, with what politeness I could muster, to continue his antics farther afield.

We have been five months in commission to-day, which reminds me of the heading of this chapter.

## II.

Generally speaking, a ship is said to be 'out of commission' or 'paid off' when she is laid up for a lengthy refit and her officers and men are not living on board. But there is room for misapprehension in the matter. Take, for instance, the case of Nelson's famous *Victory*, which still does duty as the flagship of the Commander-in-Chief at Portsmouth. If you turned her up in the Navy List, the unabridged edition of which is inaccessible to the general public during war, you would find under her name a list of nearly four hundred officers, including the Commander-in-Chief himself. Moreover, to hazard a wild guess, at least ten thousand men must wear the H.M.S. *Victory* cap-ribbon.

These officers and men all belong to the various shore establishments at Portsmouth—the Royal Naval Barracks, the Signal School, and so forth; while the gallant old three-decker herself, though she still flies an admiral's flag and answers all salutes, is manned by a 'care and maintenance party' of barely more than twenty men. Courts-martial are also held on board her in the cabin once occupied by the immortal Nelson, for, though a court-martial room was once erected in some naval barracks, I believe it to be a fact that no naval trial could legally be held ashore until this war.

Take the *President*, again, the names of whose officers fill thirty-one closely printed columns in the Navy List, and whose number must run into thousands. I doubt if many of them have ever set foot on board the 1140-ton *President* (late *Buzzard*, late sloop), moored off the Temple Pier, London, the vessel to which, by legal fiction, they all belong. They are employed in the various departments and divisions of the Admiralty, and on miscellaneous and special services all over the United Kingdom. Even the officer who has the title of 'Inspector of Coals' in Scotland nominally belongs to the *President*.

The act whereby a man-of-war is commissioned, the ritual which transforms her from a hulk into a fighting vessel, is simplicity itself. It consists merely in hoisting the White Ensign and the narrow, whip-like pendant, even the ancient formality of the commanding officer reading his commission to the assembled ship's company having fallen into desuetude. The process of commissioning, however, the preparation involved in making a ship into an efficient fighting machine, is quite a different matter. It necessitates a deal of careful organisation and hard work; while, let it be said, no vessel is thoroughly herself until she has been several months in commission and her crew have had time to shake down and have learnt to work together. But of commissioning the *Triptolemus*, more anon.

Apropos of the pendant, however, the badge of every commissioned man-of-war which does not fly the flag of an admiral or the broad pendant of a commodore, it is hardly necessary to recapitulate the story of the celebrated Admiral Martin Van Tromp, who, during the Dutch wars of the mid-seventeenth century, proved such a sharp thorn in the side of us British. Indeed, it was on 30th November 1652 that the Dutchman, with a fleet of eighty ships and three hundred merchantmen, encountered Blake in the Strait of Dover and rather worsted him. It was after his victory that Van Tromp is said to have sailed on up-Channel with a broom at his mast-head as a sign that he had swept the British from the face of the sea.

The Dutch admiral is reported to have hoisted the broom at his mast-head as a sign of contempt for our fleet, in much the same way as Von Capelle, Von Tirpitz, and certain other Teutonic naval gentlemen might possibly like to do in the present year of grace nineteen hundred and eighteen. But it must be admitted that in sixteen hundred and something we had a very difficult job in preventing the Dutch from doing what they pleased. Was it not in 1667 that a hostile squadron under De Ruyter sailed up the Medway to sink shipping and to destroy dock-yards and storehouses?

Blake, the British admiral—he was really a general, by the way, before he took to commanding fleets and winning battles afloat—is supposed to have retaliated to Van Tromp's insulting broom by hoisting a 'whip at the mast of his ship' as a sign that he would presently lash the Dutchman into submission. He carried out this threat; and it was from this whip, we are sometimes told, that the present man-of-war pendant, the narrow, white streamer with the red St George's cross next the mast, is supposed to have originated.

But it was not. The pendant came into use long before Blake's time. It started in the days of the Henrys, when seamen were mere nobodies; when there were no such things as regular men-of-war, and ordinary merchant-ships were hired or commandeered for use as fighting vessels whenever the necessity arose. These requisitioned ships were commanded by military officers, gentlemen in armour, who, on embarking, transferred the single-trail pennons borne on their lances to the mast-heads of their ships. In larger vessels or squadrons, moreover, the commanders might be knights or knights-banneret, who flew their swallow-tailed and square banners when they risked themselves afloat. Going to sea in those days was always something of an adventure, especially if one fell overboard in armour, but these emblems of command and authority have been handed down to posterity in the commodores' broad pendants and the admirals' rectangular flags of the present day.

(To be continued.)

## SOME MEMORIES OF SIR WALTER SCOTT.

By J. M. S.

**I**T has been my privilege to possess two old friends who had clear recollections of the Wizard of the North.

One cold February day, many years ago, I was conducted with a friend through deep snow to Abbotsford by the late Lord Napier and Ettrick, K.T. (who died December 1898). It was my first visit, and naturally every detail impressed itself upon me, especially as we had the good fortune to be received by the chaplain of the present owner, who was a personal friend of Lord Napier's. He showed us the armoury, full of treasures collected by Sir Walter, and each one with a history attached. There hung the keys of Loch Leven Castle, thrown into the loch by the page, Willie Douglas, as Queen Mary made her escape by boat in 1567, and guarded by the waters till, nearly one hundred years ago, they were found on a sandy bank which an exceptionally dry summer had created, and then they found their way to Abbotsford. There was the key of the old Tolbooth prison, and many other wonders. Then to the library, where stood Sir Walter's easy-chair, shelves and shelves of his favourite books, with a little gallery running round the top, and his large writing-desk. The interior, of course, is not shown to strangers, but the kind chaplain opened it for our benefit, and we saw the contents, just as the owner had left them—his tortoise-shell spectacles—or were they made of dark-coloured horn in those days?—his stump of pencil; his nail-scissors; the last accounts, which would not come right; the very last signature, 'Walter 'cott' (the omission of the initial letter showing the disease against which the writer was making such a brave fight).

Then, as we stood in the great bow-window of the long dining-room, where the creator of the 'border castle' breathed his last, the famous bust by Chantrey looked down at us with its shrewd, humorous smile, and Lord Napier took up his tale. He told us how he, as a boy of twelve, had been brought by his father to see the great writer; how the dinner began at five; and how weary and impatient, and even bored, he had been, sitting for over two mortal hours at the large round table, which still stands there, while his host discussed county business with his father. But later young Francis Napier felt that marvellous amends were made for the tedious hours at the dinner-table, for they spent the long summer evening out of doors, and Sir Walter, resting his hand on his young guest's shoulder to help his lameness, poured forth such treasures of legend, song, and story about every hill, valley, and ruin in the neighbourhood as he alone could. 'And,' said Lord Napier, as we

looked over the snow-covered grounds, across the Tweed, to the heights beyond, 'I am actually the only one in the whole countryside who has seen and spoken with Sir Walter, and am now no other than "the oldest inhabitant."'

I visited Abbotsford again as a tourist the summer before the war. The entrance was besieged by motor-cars, augmented by a continuous stream, and four guides were kept busy the livelong day in taking round parties of about ten. We waited patiently for our turn, which came at last; but my thoughts went back with regret and affection to the silence, the solitude, and the snow of my first visit.

The other old friend who retained vivid memories of Abbotsford and its founder was the Honourable Mrs Walter Arbuthnott, who died at a great age in 1891. Even when over eighty years old she retained traces of very great beauty, and, Irish by birth, though living as wife and widow in Forfarshire, she was always overflowing with wit and fun. It was she who, when various remedies for sea-sickness were being discussed, and one member of the party recommended dry champagne, exclaimed, 'Dry champagne? Stuff and nonsense! Give me dry land!'

She was fond of telling how, as a very young girl in her teens, she frequently stayed at Abbotsford as a sort of pet and plaything for the daughters of the house, Anne Scott and Sophia (Mrs Lockhart), though both were many years older than herself. She was on friendly terms with the great deerhounds, Camp and Maida, and related an incident which was repeated several times at luncheon. In view of the five o'clock dinner, this was a very simple meal—a round of cold beef, or a ham, with a dish of potatoes, followed perhaps by cake and fruit, being all that was provided. Sir Walter carved, talking eagerly all the time, and more absorbed by his stories and reminiscences than by his duties as carver. By his side sat Maida, so tall that his head was level with the table; and as slice after slice was laid on the plate, it was promptly snapped up. Sir Walter seemed to feel subconsciously that the plate was rather slow in filling, but went on talking and carving till Maida had had enough, the girl guest on his other side being too shy to interrupt his flow of conversation by calling attention to the theft.

And in her own house Mrs Arbuthnott's recollections invariably ended with the opening of a faded old brocade 'treasure-box,' in which lay a bundle of letters, tied up with almost colourless red ribbon, each letter full of kind words, pretty little compliments, fun, and *joie de vivre*, and all signed, 'Your faithful old lover, Walter Scott.'

## ABOUT PLATINUM.

## AN INDISPENSABLE METAL IN PEACE AND WAR.

By ASHMORE RUSSAN.

OVER twenty pounds an ounce in the United States of America, or about five times the value of gold; twenty pounds an ounce in the United Kingdom—the difference in value being due to a greater shortage in the United States of America, and no exports being permissible unless very recently—it follows that platinum is both scarce and in great demand, of which our Government is perfectly aware. Nearly two years ago it commandeered all available supplies of the crude metal, and constrained jewellers, dental manufacturers, pawnbrokers, and other users and dealers to make a return of all the manufactured articles of, or containing, platinum which they had in stock. At the same time all transactions in the metal were prohibited, nobody being permitted to buy except accredited agents acting for the Government, and nobody to sell, except to or with the consent of the Government.

Recently we have had the Dominions Royal Commission, or, to give it its full title, The Royal Commission on the Natural Resources, Trade, and Legislation of Certain Portions of His Majesty's Dominions, taking up the matter and dealing with it (*inter alia*) in the following terms: 'In particular it appears to us of most pressing importance to ascertain whether workable deposits exist in the British Dominions of such minerals as quicksilver, platinum, borax, and potash, which are at present obtainable almost solely from foreign sources. Also, where quantities of such minerals—for example, platinum—are known to occur in conjunction with other ores, it is imperative that steps should be taken to secure their recovery.'

The same Report continues: 'Special cases may arise in which raw materials of great economic and military importance—for example, quicksilver and platinum—cannot be found in sufficient payable quantities within the Empire. In this event we regard it of importance that British capital should be directed towards the multiplication of sources of supply.'

'If supplies cannot be obtained from British sources, it is clear that, in the general interests of the Empire, its civil and military industries should draw their supplies from as many sources as possible, and not depend on a single foreign country for their requirements.'

That platinum is indispensable the above extracts afford ample evidence. Now as to the reasons why. Readers will be more or less familiar with the peace uses of this very precious metal—for jewellery, as chains, rings, brooches, &c.; for dental uses, as palate-plates; for

chemical and metallurgical purposes, as crucibles, platinum being impervious to the corrosive action of oxygen or any other gas, and, except in *aqua regia* (a combination of nitric and hydrochloric acids), insoluble in acids. It was also, until it became too costly, in considerable demand for the 'leading-in' wires of electric incandescent lamps, and at one time for the filaments. Among other uses are for electrical 'contact-breakers'; for weights and vessels for concentrating acids; and particularly for the contact points of the ignition system of engines for aeroplanes, motors, &c.; points of magnetos; telegraph and telephone instruments, &c. The introduction about thirty years ago of platinum-type processes in photography caused a great run on the metal, and a corresponding increase in price. In 1880 it could have been bought at thirty-five shillings an ounce; ten years later it had risen to eighty shillings an ounce. Its price to-day, as we have seen, is four hundred shillings!

As may be supposed, its qualities are remarkable. Alloyed with iridium, it is the hardest of metals. It is quite unaffected by atmospheric action, and does not tarnish or oxidise in the air at even the highest temperatures. It is exceedingly malleable and ductile, and possesses an extremely high melting-point, yielding only before the oxyhydrogen blowpipe, or in a very powerful blast-furnace. It is because of this, and because it is not affected by the atmosphere, and has great electrical resistance, that it is in such clamant demand for scientific apparatus. It possesses the lowest coefficient of expansion of any metal, and has a greater specific gravity than any other known substance except the somewhat rare metals osmium and iridium, which are often found associated with it, and which it nearly equals in weight. In simple English, this substance with the bluish-white metallic lustre expands less by heat than any other metal, and is one of the heaviest forms of matter known.

The great interest taken in platinum by the Government and its experts is accounted for by the fact that in many ways it is helping to win the war. The most important, perhaps, is its use as a 'catalyser,' or 'changer,' in the fabrication of what is known as 'contact mass.' Finely divided platinum is precipitated on asbestos, or on anhydrous magnesium sulphate. The 'mass' is made by soaking the base in solutions containing platinum chloride, and afterwards heating it, which results in a distribution of fine particles of platinum throughout its body. The resultant

'contact mass' is of the greatest importance in the manufacture of sulphur trioxide, which, in combination with water, yields sulphuric acid, an essential in the manufacture of the high explosives so vital to the success of ourselves and our Allies.

Platinum has, moreover, a remarkable history, almost a literature of its own, full of interest. First discovered by a Spanish scientist, Antonio de Ulloa, in the Chocó District of Colombia, South America, now the Republic of Colombia, but at that time an appanage of the Spanish Crown, some of its qualities were quickly recognised, as its ductility, hardness, weight, and immunity from oxidation. But its market value was almost nil. Indeed, the then monarch of Spain would appear to have wished to impress the Colombian natives with the idea that it was valueless, for he caused an order to be promulgated that all platinum discovered was to be delivered to the Treasury without reward, as, perhaps, a curiosity, but not worth anything. The result being unsatisfactory, as might have been expected, for the natives had found out that platinum—when they were able to smelt it—and gold made excellent fish-hooks, it appears to have been decided to offer a small recompense. At any rate, about 1786, His Most Catholic, but not very liberal, Majesty caused an offer to be made of two pesos per pound.

It is not easy to ascertain the exact value of two pesos (dollars) at that date, but it might approximate to four shillings—for a quantity of precious metal now worth two hundred and forty pounds in London, and about two hundred and fifty pounds in New York! There is a record of one thousand nine hundred and forty kilogrammes, acquired at the price quoted, having been sent to Madrid in one year, but naturally the natives much preferred to sell their platinum to adventurers who visited the coast, from whom they obtained twelve piastres, or 'pieces of eight,' per pound, equivalent to about three pounds sterling, and a considerable improvement on two pesos, or the natives might have been expected to continue, when able, to convert their platinum into fish-hooks.

About the year 1800 platinum became rather

plentiful in Spain, where it was converted into cups, wine-jugs, and other utensils. There is a record of a chalice of the then new metal having been presented to Pope Pius IV. in 1789, and of two busts of himself having been sent as a gift to the then occupant of the Spanish throne. One of the royal busts was wholly made of platinum, the other of platinum alloyed with copper. It would be interesting to know whether those almost priceless busts are still in existence, and where they are to be found.

The Report of the Dominions Royal Commission also states that about 95 per cent. of the world's supply of platinum has been produced in Russia, the Ural Mountains being the source. But unfortunately this source is gradually becoming exhausted, the production having fallen from 300,000 troy ounces in 1911 to 78,674 troy ounces in 1916.

In the year last mentioned the approximate world's production, so far as can be ascertained, was, in order of quantity, as follows: Russia, 78,674 ounces; the Republic of Colombia, 25,000 ounces; the United States, 750 ounces; New South Wales and Tasmania, 222 ounces; Canada, 60 ounces—a total of 104,706 ounces, of the value, approximately, of £1,675,296.

The Republic of Colombia alone appears to be increasing its production, which was 12,000 ounces in 1911 and 1912 respectively, 15,000 ounces in 1913, 17,500 ounces in 1914, 18,000 ounces in 1915, and, as stated, 25,000 ounces in 1916.

The Chocó District, where all the Colombian platinum is found, comprises an area of from 20,000 to 25,000 square miles, and it is said that the whole of the river-lands contain that precious metal, which is obtained by washing the gravels and earth. But with the crude appliances used by the natives, as picks, shovels, and pans, there would not appear to be much hope of making up the shortage which is disturbing the authorities. It is true, there is a dredge at work on one of the Colombian rivers, but from all accounts at least a hundred dredges could be employed profitably and without greatly diminishing the market value of the metal.

## THE NELSON TOUCH.

By JOHN S. MARGERISON, Author of *The Sure Shield*; *Action! Turret and Torpedo*; &c.

THE destroyer looked the embodiment of force and speed as she swept down upon the lone trawler. The latter, pursuing her lawful and peaceful occasions on the Dogger Bank, saw many such craft in the course of her fishing, and therefore bestowed little or no notice upon them.

But this one was different—her second in command had once worked under Amos Birch,

master of the steam-trawler *Nelson*—and whenever she passed the lonely fisherman she made a point of deviating from her course and exchanging news and notions with Birch and his one-legged son James; and, in consideration of sundry pounds of tobacco and 'tots' of spirit—raw, neat, and pungent—the destroyer usually backed away to her vigil with a plentiful supply of still flapping fish wherewith to eke out the

items on her bill of fare; which same items, be it understood, usually came out of cans. And this time, in addition to more tangible things, she conveyed to the *Nelson* a warning—an intimation regarding a Boche *unterseeboot* which had lately been located in that vicinity, and which, possessing marvellous cunning, had so far escaped the traps set for him by the hunters.

The U-boat, according to the war-vessel, made a speciality of strafing unarmed vessels. Only the previous week he had cropped up off the Norwegian coast, and had shelled a drifter working there till the drifter's crew had been compelled to take to their boats. Then the victorious U-boat had approached and boarded the still floating wreck, transferred the whole catch of fresh fish to his own holds, and sheered off, leaving the fishermen to sink or swim, as Heaven or fate should decide.

'Yes, it's just like him,' mused Skipper Birch. 'The Boche is a dirty dog at the best of times, and the sooner he's taught manners the better for all hands. I hope, however, this particular chap doesn't come alongside me; I haven't even got a pea-shooter to fight him with.'

'No,' laughed the destroyer's commander. 'If you should see him, just put some salt on his tail, and keep him till I call again. I'll give you a fiver for the Hun-bird every time you catch him.'

Skipper Birch laughed. 'D'ye think,' queried he, 'that if I could get close enough to salt Fritz's tail, I'd wait for you to come along? Not me. I'd tie him up astern and tow him into harbour, and then make a fortune showing him at a penny a head.'

'Well, I must be going,' replied the other. 'Keep your eye lifting and your salt-pot ready. You may not have long to wait before he turns up and pays you a friendly call.'

And, with a whisk of her stern, the warcraft stood off towards her beat in that eternal chain which guards the shore of the Island Kingdom.

That commander might have been endowed with the gift of prophecy. At any rate, it was scarcely two hours after the wake of his screws dissolved into the surrounding water that a long, thin, broomstick-like object thrust itself through the surface of the North Sea, elongated itself into a full-sized periscope, broadened out into a conning-tower upon which were black and white diapering and a huge 'U 77,' and finally flattened into a whaleback, with a nasty, clamorous, fire-spitting four-inch gun perched atop.

The U-boat wasn't even polite enough to introduce himself, or to wait until the *Nelson* made overtures with a view to their becoming acquainted. He simply swung round the muzzle of the four-inch till it bore directly upon the trawler, and proceeded to make matchwood and scrap-iron of what, though exceedingly elderly and obsolete, was a very efficient fishing-craft.

The *Nelson*, having her trawl down, was com-

pletely at the submarine's mercy, and, even had the trawler been a modern, steel-built craft, she must have been battered to pieces in a second. As it was, her crew of ten had all their work cut out to deal with the fires that started among her splintered woodwork; and, one after another, four of these dropped where they stood, victims to the hand of the assassin.

Skipper Birch, perched atop the frail bridge, and heedless of the shells which flew around him, turned over the well-thumbed pages of the International Code Signal Manual, and, after finding the page he required, hauled a string of vari-coloured bunting to the *Nelson's* mast-head. The German read it and snarled; he had seen it scores of times before, whenever a ship upon which he had opened fire had intimated her willingness to surrender in order to save the lives of her company.

But, in spite of that unconditional offer to accept his terms, the German's gun spoke again and again, now—having made sure that the trawler was wholly unarmed—more slowly and deliberately than ever. It turned its attention to the aftermost of the two small dinghies the *Nelson* carried, and when that four-inch had finished with it, the boat was a heap of smoking splinters. The deckhouse came next; then the funnel; and presently the shells worked forward till they reached the now evacuated bridge once more. Ten seconds sufficed to complete the demolition of this structure; and then, for the first time, the gun grew silent.

'Trawler ahoy!' hailed the *oberleutnant*.

James Birch poked his head cautiously above the bulwarks—he had heard of the Boche hailing a ship, and then, as soon as answered, turning the one who responded into a target for his automatic pistol bullets. But in this case there was no shooting, and at length James stood upright in full view, and waved an arm in acknowledgment of the hail.

'Trawler,' said the *oberleutnant*, closing his boat within fifty yards, 'please lower your boat and come across. I have refrained from splintering it so far, as you see.'

And, as though feeling the inward glow of true benevolence, the officer straightened his back and held erect his head, watching the lowering of the dinghy and the commencement of the passage between trawler and submarine. And, to ensure that the former should meditate no treachery, the latter kept the four-inch laid on her midship portion, while the Boche crew stood ready with drawn pistols to beat back any attempt at boarding made by the three half-murdered men in the cockleshell boat.

The dinghy reached the submarine, and, with a snarling oath, the *oberleutnant* stepped down from his conning-tower into its sternsheets.

'Back to your vessel, *schweinehund*!' he snapped, fingering the trigger of his automatic.

Captain Birch stood watching the dinghy's

progress. 'Jim,' he exclaimed suddenly, 'I'm wounded; play up to me.'

Deliberately, callously, the skipper rolled in a pool of blood which had ebbed from the veins of one of his men, and, with a dirty handkerchief, made shift to bandage his head. Smothered in blood from head to foot, he was an awful sight, and the groans he emitted could not have contained more agony had they come from a man mortally wounded. Jim, sensing something of his father's purport, smiled and hastened to the gangway to receive the Boche.

'The captain—where is he?' demanded the *oberleutnant*, keeping that automatic readily poked forward. 'Quick; take me to him. I have no time to waste.'

'This way, sir,' said Jim, with an assumption of abject fear. 'The skipper lies under the bridge, sir, nigh to dying.'

The German's lip curled, and there was no sympathy or tenderness in his eyes as he looked upon the blood-stained form of Skipper Birch.

'You surrender your ship, *hein*?' he asked aggressively.

'I signalled that same to you half-an-hour ago,' responded Birch. 'But since then you've killed four of my hands, and finished me. Yes, you can have the ship and all that's in her; I'll not want her across the Border.'

The Boche hid a smile and turned to Jim. 'You will get all the hatches off and stand by to transfer your fish to us, Herr,' he commanded. 'It will be a welcome change of diet for us; and, see, we will pay you for it. We will allow you and your crew to get away in your boat before we sink your trawler utterly.'

'Very kind of you, I'm sure,' said James quietly.

The German looked at the one-legged youngster sharply, as though suspecting a *double entente* in the words, but Jim's face was a blank as he shouted a string of orders. The German, after a quick glance round, strode to the *Nelson's* bulwarks and hailed his own vessel.

'Come alongside,' he hailed. 'We have provisions for you.'

His face creased in a smirk at his own witticism, and the submarine's servile crew laughed aloud as though at some huge joke. They knew that it paid them to pretend to appreciate their commander's playfulness; Fritz had a very short way with those who displeased him in even the slightest manner.

The U-boat hove her sinuous length across the waters, and presently came alongside. Wire hawsers were passed from the trawler to her, and, snugly secured, she rode the waves.

The *oberleutnant* again took charge. 'Open the torpedo-hatch,' he ordered. 'And, half of you, get below and stand by to stow these fish as they are thrown down. You, Hermann, Johann, and Ludwig, remain on deck at the gun; keep a good look-out for any interfering

Englischer warcraft, and let me know as soon as you sight anything. Carry on.'

The Germans dissolved into the submarine's interior, the three named men leaning over the breech of their gun and animatedly discussing their chances of seeing harbour that week. The *oberleutnant*, after the fish had commenced their passage from trawler to submarine, called Jim to attend him, and made a tour of the ship with a view to picking up any unconsidered trifle of loot that might strike his eye. But, instead, he picked up something that never struck his eye—a blow from a short iron crowbar, which dropped on the top of his head, and plunged him through a meteor-filled abyss into the dark and bottomless chasm of oblivion. He never knew what followed; never understood why the blood-stained form of Skipper Birch, being carried below by two of his men, should so suddenly become animated; never felt the fingers that stripped him, or saw the now exceedingly nimble skipper rig himself out in the gold-laced garments taken from his own body.

Hugely surprised would he have been to see the alacrity with which Hermann, Johann, and Ludwig thrust their hands heavenwards when the muzzle of his own automatic pistol—now in the hands of Jim Birch—menaced them; equally surprised to find himself being more or less roughly hauled across decks and up ladders till he lay, face downwards, on the top of his own conning-tower, while, the single automatic pistol now being multiplied by four—the three German sailors possessed one each, but had no opportunity of using them—four of the *Nelson's* crew stood guard over the torpedo-hatch, and waited for some one to come and inquire why the stream of passing fish had so suddenly ceased.

But, quite suddenly, the functions of these four men ceased; the patent torpedo-hatch shot down, and its inner bolts were slammed home, defying all their efforts to lift it. But, with the utmost nonchalance, they shot the outer bolts, and thus prevented the Germans inside the submarine opening it also.

'You slammed it to and locked it when you liked,' said one of the *Nelson's* men. 'You shall open it when it pleases us, and not before.'

Somebody at the foot of the conning-tower ladder, well inside the submarine, started shooting upwards, and his bullet grazed the cheek of Skipper Birch.

'I'll soon stop that little game,' quoth the skipper. 'Here, Jim, lend me a hand; we'll shove this *oberleutnant* of theirs across the line of fire, and see if they'll do any target practice then.'

Jim and his father carried out the idea; they pushed the blanket-wrapped figure of the officer over the opening in the conning-tower, and they even improved upon the original suggestion by jamming the *oberleutnant's* head half-way down it and over the edge of the sliding watertight hatch.

'Now,' cried Skipper Birch, in the plainest of English, 'try your monkey tricks on, Mr Boche. Shoot—and you'll punch holes only through the body of your own officer; try to close your conning-tower hatch and submerge, and you'll not only crush his ribs, but you'll find so much water coming into the boat that you'll go down farther and deeper than you'll quite like. On the other hand, go ahead with your surface engines and see if you can manage to tow the old *Nelson*, especially if she has her trawl down and her own engines going full speed astern; also, if that isn't enough to stop you, we'll see what a sea-anchor can do in the matter of checking your way; or, maybe, towing a couple of buckets astern will do the trick. Try it, anyway.'

The Germans tried it. They found themselves moving only about an inch in a week. The *oberleutnant*, having now regained consciousness, gave them terribly threatening orders when they attempted to close the conning-tower hatch upon him; and the torpedo-hatch refused to budge in spite of all their efforts. And all the time, clad in the *oberleutnant's* garb, with the *oberleutnant's* loaded pistol pressed into the back of the *oberleutnant's* neck, with his whole weight deposited comfortably—for himself—in the small of the *oberleutnant's* back at the place where it bent ungracefully over the edge of the conning-tower's sliding watertight door, sat Skipper Amos Birch, entreating his prisoners to oblige him by singing the 'Hymn of Hate,' or, if so be that they didn't happen to know that famous concoction, the strains of '*Deutschland über Alles*.' But they sent him up consolidated hate in streams, without music, and with hardly intelligible words, until his case-hardened soul rejoiced.

Once or twice the *oberleutnant's* groans—Skipper Birch was by no means a light weight—almost softened his heart; but a glance at the shell-scarred trawler and the memory of those four huddled figures on her decks banished all compassion, and he only sat the tighter, and screwed the menacing pistol farther home.

'That trawler's name, now, Mr Boche,' he murmured at times—'that should have been a warning to you. *Nelson* it is; named after the finest fighting sailor-man that ever was. And, if it's any consolation to your soul, my lad, just think of this little business as what they call a "Nelson touch," and you'll not be far wrong. And, by that same token, I'm hoping that destroyer won't be long before she appears, or I shall have to shoot you as you lie, just to make sure that, while I'm having the sleep I so badly need, you don't wriggle clear and apply another Nelson touch—that of keelhauling—to me and my lads.'

The destroyer hove in sight just as dawn grayed the eastern sky, and, so that her feet

might not linger in the more or less pleasant sea-lanes, three of Skipper Birch's crew made shift to fire the submarine's four-inch. And, at the report, the war-vessel pricked up her ears, and, eager for a scrap, came swiftly across the waters, and paused only at the submarine's side, to hold her sides in silent laughter, and, later, to ask questions.

'Hello, skipper!' cried the commander. 'So he did pay you a visit, after all, eh?'

'Ay; and he stayed to tea as well,' replied Birch, 'though I had the dickens of a job getting him to remain over till this morning. You see, I had to take away his clothes and wear 'em myself, and his little pop-gun too, though that came in handy to persuade his valet, his cook and bottle-washer, and the rest of his retinue to stop as well. By the way, he won't sing—he's rotten company—though I believe he's got a good voice. I can't get either the "Hymn of Hate" or "*Deutschland über Alles*" out of him, though I've been spinning him a yarn all night about a Nelson touch.'

'Rotten sort as guests, aren't they?' laughed the commander. 'Well, seeing that you've got the salt on his tail as per prescription, shall I lead him to his little nest, and hand over the fiver?'

Skipper Birch scratched his head in rumination for a moment. He looked over the battered *Nelson* and over the U-boat; he regarded his own resplendent form and the blanket-wrapped German.

'Well,' he said at last, 'you can take over the Hun-bird with the salted tail and cart him into harbour; also, at the same time, you can sling me a rope across, and I'll follow you—just to see that the old *Nelson* isn't swindled. But, as for the fiver, you can keep that to buy sweets with. I'm by way of thinking that repairs to the *Nelson*, compensation to the crew, to me for the good suit I've ruined, and to the widows and orphans of the four men who've gone west in this little scrimmage, will swallow up all the prize-money we'll get for having applied to at least one Hun-bird what they'll be ill-pleased to remember as "the *Nelson* touch."'

#### FRIENDSHIP.

FRIENDSHIP's years are a spinning thread,  
Sparkling in friendship's sun;  
But when the ties of friends are dead,  
The spinning thread is spun.

Lovelight shines from the length'ning thread  
In tender, tremulous rays,  
Woven silver, gold, and red—  
The tale of happy days.

And, if to culminate our fears  
The thread is spun at last,  
Its colour dimmed by unshed tears,  
It 'twines itself through all the years,  
Fair memory of the past.

## SEVENTH SERIES

### THE PHILANDERER.

By ASHMORE RUSSAN.

#### CHAPTER I.

Oh, wilding chicks come home to roost;  
And lapses—ere one grows a beard—  
In gray *sagesse* are met in joust;  
Lads light o' love must dree their weird!

PHIL McANDREW had never felt need or inclination to stare at the Pacific—'silent,' from the difficult vantage of 'a peak in Darien.' It would have entailed wholly unnecessary and distasteful exertion. A hammock in his father's orange-orchard a few hundred yards from the beach at Panamá, overlooking the before-mentioned often-anything-but-tranquil ocean at the easily accessible altitude of sixty feet or so, afforded a sufficiently satisfactory view-point; while the frolics of youthful companions appealed to him more strongly than any wondering silence of 'stout Cortes and all his men' could possibly have done, however thrilling. From which it may be gathered that the youth was a lotus-eater, which is a poet's euphemism for a dissyllabic descriptive word beginning with the same letter.

A Creole from New Orleans, whose loveliness had taken the heart of her man by storm—dour Scot and rough diamond though he was—had brought Phil into the world, and bestowed upon him a gift which she considered her greatest and best, for she had given the boy full measure of her extraordinary beauty. He was her counterpart, with black eyes that could flash with simulated passion, or plead irresistibly for love, as he willed; jetty hair curling over an ivory forehead; features clean chiselled as those of an Antinous or a Narcissus; complexion pale olive and roses. He would have made the most bewitching girl, as, indeed, he was the handsomest boy imaginable.

*Simpatico*—estimable attribute amongst the Latins of Central and South America—and generous, for Duncan McAndrew, the dour, had garnered much gear, and was not niggardly with it, the boy had shoals of friends, some of whom were generally to be found in the McAndrews' great white bungalow, in the well-kept gardens, or in the orchard, where tree-ferns, yuccas, palms, flowering cacti, and broad-leaved plantains mingled with oranges, lemons, limes, mangoes, guavas, and avocates; while orchids—almost priceless in

other climes—in baskets, or fastened on any odd fragment of wood, depended from almost every branch within reach.

In the orchard we find him, swinging lazily in a roomy *hamaca* hung from a gnarled arm of an ancient mango-tree, and only separated from another similar *hamaca*, hanging parallel, by a basket of *Peristeria elata*, the 'dove' orchid, or *Espiritu Santo* flower of Central America. In this *hamaca* reclined a girl, fair-tressed and blue-eyed, good to look upon in every way—his cousin, Flora Cameron.

'It's no use being unkind about it, Flo,' he was saying, in his gentle, caressing voice; 'I can't help myself. The governor says I've got to go to Moctezuma, and learn how to manage the *finca*. You know him as well as I do. When he says a thing he means it, and it's no use my kicking. Even the mater agrees with him. She wishes me to go; so I suppose I'll have to.'

'I also wish you to go,' rejoined the girl, 'but—not alone—to live there alone'—she hesitated in some confusion. 'It hurts to have to remind you. You made me promise, and I did it gladly. You are twenty-one. But even if you were not of age, your father would be pleased. You have only to ask him.'

The boy turned in his hammock. 'The mater wouldn't hear of it,' he said over his shoulder.

'Mothers are like that,' returned the girl. Three years Phil's junior, she was a woman, he only a child in comparison. 'Nobody is ever good enough for an only son. And I belong to your father's family, not hers,' she added.

'Any mother would say I hadn't seen enough of the world, if I am twenty-one,' he retorted.

'Then you were only playing when you pretended to be in love with me—when you kissed me, and made me kiss you?' exclaimed the girl angrily, red spots showing on both cheeks as she swung herself half out of the hammock. 'Do you expect me to ask you outright to keep your promise?'

'Don't get cross, Flo,' he pleaded. 'It'll all come right in a year or two. I'll write to you, APRIL 20, 1918.'

and I'll be glad to get letters from you. We're only kids yet, Flo, and we might both be very sorry. Besides, you'd be miserable on Moctezuma, up there on that mountain amongst the Mexican Indians. They're a rough lot; and I'm thinking of you just as much as of myself.'

The girl, who was now sitting on the edge of the hammock, rose to her feet. 'I dare say,' she rejoined scornfully. 'If you were thinking of me, you would consider my self-respect. You would understand what it means to a girl, who has allowed herself to be made love to, to be treated like this. I made myself cheap, and I hate myself for it. To-morrow I shall hate you. Oh, without the Mc you'd be well named—Phil Andrew—Philanderer. There isn't much difference in the spelling, and the words mean the same thing. I ought to have been warned by the way you treated little Lola Mendez. Poor child! She's Dolores now. She'll never be light-hearted Lola any more. But you won't break my heart, Phil. I am Scottish—a great deal more Scottish than you are, and you will pay.' She broke a spray from the orchid beside her, a white flower like a dove with wings partly raised as if for flight. 'You gave me one of these that night,' she went on bitterly. 'I give it back to you for remembrance—to remind you that I am not a dove now, whatever I may have been, and it will be no use offering me an olive-branch. I won't take it.'

'I didn't know you were such an awful shrew, Flo,' he remarked plaintively.

'Oh!' she gasped. 'And that is all you can say—accuse me of shrewishness!—you coward! But I have done. I wouldn't marry you now if'—

She was about to add 'if there wasn't another man in the world,' which in such an extraordinary contingency would have condemned her to lifelong single-something-or-other, but her sense of humour and Scottish practicalness checked the banality on her tongue. She walked away without another word, contemptuous and justly angry.

During some six months her cousin had made love to her—had asked her to marry him on several occasions; had jilted Lola Mendez on her account, or so he had allowed her to infer—a lapse very easy for the chosen one to forgive. She was sure that dour Duncan would have been pleased to see her his son's wife. Several times he had asked her to extend her visit. But it now appeared that Phil preferred to occupy the big *casa* on the Moctezuma *finca* alone, as the manager, who had been in charge for years, was leaving. He did not wish to marry at present; therefore, as she correctly reasoned, he had been playing with her, as for a man in love not to want to marry was contrary to human nature, as she understood it. That Mrs McAndrew would object strongly was probable, but for the reason

she had stated, and not on account of the relationship—she and Phil were only second cousins, and that degree of kinship was no bar.

It had been arranged that Phil should leave Panamá for Mexico on the first boat which would call at the port of Ocos in Guatemala, as by that route he could get a train to take him half-way to Moctezuma. Such a coasting-steamer left a few days later, and the Philanderer went with it. Duncan McAndrew and his still beautiful wife saw him off, as also did a score or more of his friends; but Flora Cameron was not present. Although staying at the bungalow, she had avoided him almost completely—indeed, had not exchanged half-a-dozen words with him since those herein recorded. Duncan McAndrew, however, had had much to say in his homely way, the following included:

'I hae written tae McNab, ma lad, and he has his instructions—to mak' a mon o' ye if it's ony way possible. Ye're juist a feckless bairn the noo, wi' nae thocht but tae hae what ye misca' a guid time wi' thae lads an' lasses—mair especially the lasses. McNab'll gie ye wark eneuch, an' he'll report every month. As for lasses, except Indian *muchachas*, maistly squat an' unco' ugly, there are nane nearer than fifteen miles o' Moctezuma, as nae doot ye're aware o'. McNab is sair set on gettin' back tae Aberdeen, and I've promised tae let him go, an' gie him a pension as sune as he can report conscientiously that you're fit tae be left in charge. He's a guid man, McNab. He'll dae his best wi' ye. He's earned his pension, and is keen set on gettin' it.'

Not a word did grizzled and dour Duncan McAndrew utter with regard to Flora Cameron, although he was much too canny not to be aware that something had happened.

So Phil duly arrived at Ocos, whence he journeyed to Moctezuma, being met at the nearest railway station by McNab and a couple of *mozos* with riding-animals. At the Casa Grande, a great, oblong wooden house on stone pillars, with two verandas overlooking the *plaza* and the church on one side, and on the other the coffee-drying *patios*, the stores, and machinery buildings, he took up his residence, and for a month or so worked to the satisfaction of McNab, whose yearning to spend the end of his life amongst his own people was only natural after forty years in Mexico and Central America. Every other day the Philanderer was present at roll-call, which took place at four o'clock in the morning; every forenoon he rode over each area where work was going on, supervising planting, pruning, and cleaning operations under McNab's watchful eyes; and then, at the expiration of the indefinite period mentioned, he tired of it all.

'This life's too stupidly dull for anything,' he complained. 'Think I'll go down to Santo Domingo for a change.'

'Vera weel,' rejoined McNab, who was no jailer. 'How lang for?'

'Oh, a day or two. The Lopez people will put me up, I expect.'

'Oh ay, nae doot o' that,' said McNab dryly, 'seein' who ye hae for a father, an' ta length o' his pooch. But I misdoot ye'll get into mischief. There's twa *señoritas* at Santo Domingo I hae in mind to warn ye o'. Don Duncan wrote as ye'd a girt weakness for ta lasses, so I'm juist tellin' ye tae hae a care.'

As might be supposed, the Philanderer was greatly amused, laughed heartily in his pleasant way, and rode off the same hour. The Lopez *finca*, Santo Domingo, was the nearest coffee-plantation to Tapachula, the largest town in that part of the state of Chiapas; and Tapachula could and did boast of numerous *tiendas*, two hotels, a theatre, a club, recreation-grounds, and other places where time could be passed more or less unprofitably.

Mexican *finqueros* may always be relied upon for hospitality, but at Santo Domingo Phil McAndrew was received with something like enthusiasm. Don Manuel and Doña Isabel, who had been very friendly with Duncan McAndrew in days gone by, when the last-named was planting Moctezuma, greeted him like a long-lost relation, placed everything they possessed at his disposition with more than the customary Mexican liberality, and, as he was an *extranjero*, therefore not to be too strictly bound by Mexican social observances, introduced him to their two pretty daughters without loss of time, as also to the rest of the family, which included their son Pablo, who had the reputation of being *un hombre vivo*—i.e. a young man very much alive, but rather given to gambling, cock-fighting, and drinking more *aguardiente* and *vino tinto* than was good for him, as also Scotch and rye whiskies when he could get them.

As for the girls, Carmen and Josefa, respectively of seventeen and fifteen years, they were not only pretty and charming—Pepita, as the younger was generally called, being quite a beauty—but educated, for Tapachula could also boast of a seminary for young ladies, attached to a convent, which they, living so near, had attended for some years. Naturally, having been an anchorite for six weeks or so, the Philanderer fell in love with both of them within twenty-four hours. This would not have hurt anybody, least of all the Philanderer; but unfortunately the girls both fell in love with him in the same brief period of time.

That also might not have harmed either *señorita* very much, for young ladies in Mexico seldom wed the youths they fancy, opportunities for real courtship being very difficult to come by; but the elder girl being required to go to the town on some errand, the Philanderer rode with her, and instead of taking her back home immediately her little *negocios* were finished, he

persuaded her to stable her pony at a *tienda* and accompany him to the recreation-grounds, where he rowed her about on the lake in full view of all the pleasure-seekers there, and made love to her after the manner of his kind, also in full view of everybody. Time sped swiftly, darkness came on with its usual suddenness, and—unheard-of thing!—the couple rode home alone together by the light of the stars.

Even then, as they contrived to get their animals stabled and themselves into the Santo Domingo *casa* unperceived by any of the family, nothing unpleasant would have happened but for the intervention of the green-eyed monster.

'Where have you been?' asked the younger and more *petite* *señorita* at the first opportunity.

'To Tapachula,' replied the elder.

'With Don Felipe?' demanded Pepita.

'He rode with me,' Carmen replied.

'Oh!' flashed the little beauty, in a rage. 'And you have just returned? It is disgraceful! What have you been doing?'

Had Carmen been a prudent *señorita* she would have told an innocent tarradiddle about her pony having thrown a shoe, and the blacksmith having to be sought in all the *tiendas* in the town; but, truth to tell, she was rather proud of the escapade, elated, and more than a little agitated by the experienced and very handsome Philanderer's love-making, therefore disposed to let prudence go hang, or whatever may be the equivalent in the mind of an innocent, carefully shielded Mexican maiden.

'I have been with Don Felipe in a boat on the water,' she said, adding, after a pause for effect, 'He loves me!'

'You cat! You wicked cat!' raged the fiery Pepita; and snatching a slipper from a bare and very pretty foot, she struck her sister in the face with it, then flinging it down, seized a plait of Carmen's raven hair and tugged it viciously. 'I'll tell *el padre*! I'll tell Sister Dolores!' shrieked the child of nature. 'I'll tell my *madre* and Pablo! Everybody shall know!'

Alarmed, fearful of the consequences, the elder girl endeavoured to soothe the jealous little spitfire; but the mischief had been done. The Señora Lopez had overheard the quarrel. The story came out in all its heinousness. A storm in a tea-cup, the reader may be inclined to think. An apology, and then—but in Mexico an apology in such a matter is an insult. There is only one remedy, one expiation.

Phil McAndrew would have ridden off to Moctezuma, and taken train and boat to Panamá if necessary, but the opportunity was not given him. A family meeting was convened at once, at which he was obliged to be present. Carmen and Pepita shed many tears. Don Manuel and Doña Isabel took the result for granted, and

spoke very little. *El hombre vivo*, Don Pablo, said everything for everybody, and sufficient for all.

'What have you to say, Don Felipe?' he demanded finally, fingering the butt of a revolver in its leather frog on his hip. 'You are British, but you know our ways. You knew my sister would be compromised—that such things are not allowed even to affianced in this country. Everybody knows. I was in the town. I heard of it. I knocked down the man who told me. I did not believe. You will marry my sister, of course—when?'

'Si, señor—when?' echoed Don Manuel and Doña Isabel together.

The Philanderer was not really a coward—at least, not all the time. Nor did he feel entrapped. As Don Pablo had said, he knew the customs of Spanish America. Telling himself that he had been a fool, he did the right thing. Crossing the room to Carmen's side, he took her hand.

'If Carmencita will be my wife,' he said, 'I will marry her whenever you like.'

'Buena!' exclaimed Don Pablo.

'Muy buena!' echoed Don Manuel and Doña Isabel.

Pepita ran from the room, bitterly repentant.

She had terminated her first, if very shadowy, love romance with a vengeance!

The Philanderer returned to Moctezuma next day, and told McNab, who shook his gray head sagely, said little, and sat down to write to his *padron*, Duncan McAndrew. The receipt of his letter at the white bungalow caused Mrs McAndrew to have a fit of hysterics. Duncan, generally so dour, laughed.

'I wad suner it had been Flora,' he said. 'A guid girl o' guid Scots stock, she wad hae been the woman for him. But it might hae been waur. Don Manuel was a guid friend lang syne, and aye helpful tae inexperience. A' the Lopezes were respected, an' we maun juist bide wi' what canna be mended. I'll let McNab gae hame noo, an' he shall hae his pension. Don Manuel'll see the young fule doesna ruin the *finca*.'

Flora Cameron uttered but one word when she heard the news—'Oh!' but her sunburned, brown face paled suddenly.

A month after their betrothal Phil McAndrew and Carmen Lopez were married, and went to reside in the Casa Grande at Moctezuma—which is not the end of this story, but merely the end of the first chapter.

(Continued on page 345.)

## THE BALANCE OF POWER.

By Sir RICHARD LODGE, Professor of History in the University of Edinburgh, and Author of *The Student's Modern Europe, The Close of the Middle Ages, &c.*

THE doctrine of the balance of power has been defined by an eminent professor of international law as the political maxim 'that no single state should be allowed to become strong enough to overbear the aggregate strength of the rest or of some considerable proportion of their aggregate strength.' The maxim had its origin in the internal politics of Italy at the close of the Middle Ages. Machiavelli describes in *The Prince* how the five predominant Italian states in the fifteenth century—Venice, Milan, Florence, the Papacy, and Naples—schemed to prevent any one of themselves from obtaining excessive power. From Italy, the instructor of Europe in art, literature, science, and statecraft, the conception of a necessary political balance spread to the newly formed European states, whose earliest international relations were concerned with the assertion of rival claims to territories and to domination in Italy. The doctrine took perhaps its deepest root in our own country, and, although other motives—religious, commercial, and colonial—have played their part in moulding our foreign policy, the necessity of maintaining the European balance has been a continuous and a dominant tradition of our Foreign Office from the sixteenth century to the present day.

For generations this tradition was accepted as axiomatic and as a sort of natural law. It was followed and defended by politicians of hostile parties, and it contributed to secure continuity in our foreign policy, and to keep it, at any rate partially, outside the turmoil of ordinary party disputes. The first notable attack on the tradition was made by John Bright, who regarded it as responsible for our participation in the Crimean War. With characteristic vehemence he denounced the doctrine of the balance as 'a foul idol, fouler than any to which heathen ever bowed.' For the last fifty years extreme Radicals, and in recent years representatives of the Labour Party, have, with varying degrees of emphasis, repeated these denunciations. The outbreak of the present war, and the assertion in some quarters that one of its motives is to restore the balance of power, has revived the controversy in an acute form, and the Union of Democratic Control has thought it worth while to circulate a pamphlet attacking the traditional doctrine as laying undue stress upon national rivalries, as fatal to international co-operation, and as the fertile parent of wars.

In view of this controversy, it may be of interest to glance at the operation of the doctrine in past history. To trace this in detail would be

to write the history of Europe for the last four centuries. But there have been four notable occasions on which the balance of power has been momentarily overthrown, and an obstinate struggle has been fought for its restoration. On three of these occasions our own country has played a prominent and almost a decisive part, and some of the proudest and most familiar traditions of our national history are associated with these struggles. The first great disturbance of the balance came very early in international history, before any state had had time to develop or formulate any definite principles of foreign policy. In the early years of the sixteenth century the accidents of intermarriage and death brought to the young Archduke Charles of Austria the most magnificent inheritance that ever fell to the lot of any prince. In succession he became the ruler of the then undivided Netherlands, of the kingdom of Spain, with its Italian provinces and with its vast dominions and vaster claims in the New World, and finally of Austria and the other German territories of the House of Hapsburg. To this vast inheritance he added by election the dignity of Holy Roman Emperor as Charles V.

The task of defending the liberties of Europe against this menacing agglomeration of lands and wealth in the hands of a single ruler devolved upon France, whose national existence seemed likely to be strangled by the encircling coils of the Hapsburg hydra. England played rather an ignoble part. Henry VIII. and Wolsey, often strangely credited with the invention of the doctrine of a balance, were tempted by the prospect of a share in the spoil into alliance with the emperor, and it was only after the defeat and capture of the French king that the disappointment of their hopes drove them into a tardy league with France. Even then they gave little active assistance, and France, almost single-handed, would have been hard pressed to hold its own had not Charles V. been harassed by Protestant opposition in Germany and by the Turkish wars. As it was, the Hapsburg power was shaken rather than broken when Charles V. abdicated and divided his vast dominions between his son and his brother.

In the next generation the danger to the balance of power was revived in an acute form. The loss of the German provinces freed the Spanish monarchy from weakening distractions, and the annexation of Portugal in 1580 gave to Philip II. not only the control of the whole peninsula, but also a claim to the undivided sovereignty in the eastern as well as in the western world. This time England played a more honourable part. Her sailors refused to recognise the Spanish claim to an exclusive right of trade and settlement in the newly discovered regions, and, aided by the revolt of the Netherlands, and by an alliance with the rising naval power of the Dutch and the French, Elizabethan

England not only secured its own independence by dispersing the Armada, but vindicated the liberties of Europe by crushing the might of Spain. But the hostility evoked during the long struggle, and intensified by religious antagonism, lasted long after the original motive had been weakened by success, and England, by clinging under the Stewarts and under Cromwell to the French alliance, helped to build up a Power which proved as dangerous and dictatorial as Spain had been in her palmy days.

Louis XIV., who inherited the gains which France had amassed under Richelieu and Mazarin, was the prototype of the present German Emperor. In the French Army, led by great soldiers like Condé, Turenne, and Luxembourg, he possessed a military machine with which he defied and defeated successive coalitions against him. Confident in his strength, he claimed to dictate his will to the humbled Powers of Europe. The climax of his ambition seemed to be reached when the last Hapsburg king of Spain bequeathed the still imposing Spanish dominions to a Bourbon prince. At this crisis England again came to the rescue of Europe. The last achievement of William III., the lifelong opponent of Louis, was the formation of the Grand Alliance, and after his death the military genius of Marlborough and Prince Eugene rendered possible a settlement which put an end to French ascendancy and restored the balance of power.

For nearly a hundred years after the Peace of Utrecht the balance in Europe was occasionally shaken, but never seriously disturbed. The next great crisis, the last before the present war, arose out of the wars which had their origin in the French Revolution. Not content with the glory of having repulsed the attack of a great European coalition, France became in its turn the aggressor, and the marvellous exploits of Napoleon Bonaparte made him for a time the master both of France and of the Continent. The zenith of his power was reached in 1807 when the Russian Czar became his accomplice at Tilsit, and a vast Continental league was organised to crush the one obstinate and unsubdued opponent, Great Britain. But the naval ascendancy which Nelson had bequeathed as his legacy rendered this country immune from direct attack, and the attempt to destroy British trade recoiled upon France by provoking the enmity, and at last the national antagonism, of both subject and allied peoples. Once more peace was secured to Europe by the restoration of a balance of power in 1815.

It is clear that the effort to restore the balance after it has been overthrown has resulted in prolonged and desperate wars, and in all the sacrifices which such wars involve. Yet it is difficult for any one who admits that war is at times inevitable to deny that these wars were necessary and essentially righteous wars. The whole of our national history must be rewritten

and our national traditions must be reconstructed if the struggles which brought immortal fame to Francis Drake, to Marlborough, to Nelson and Wellington, are to be condemned because they were entered into for the principle of the balance of power. For there were only two alternatives to war. Either we should have humbly bowed the knee to the conquering Power and allowed the national existence of the lesser states to be destroyed, or we should have become the partners and accomplices of the conqueror, and sought to pacify our uneasy conscience with a possible share of the spoil. This was the policy which Henry VIII. and Wolsey attempted in 1520, and into which Alexander I. of Russia was tempted at Tilsit. This was the policy which led to the infamous partitions of Poland, when Austria and Prussia were induced, the one reluctantly and the other willingly, to connive at the aggressive policy of Russia on condition that they should receive an equivalent. This monstrous perversion of the principle of the balance, that robbery is licensed as long as the thieves take equal shares, would have been fatal to the lesser states of Europe. But it has never been accepted by Great Britain.

An argument which is often urged against these great wars for the restoration of the balance is that the ultimate settlement was often based upon a disregard of the principle of nationality, that in the treaties of Utrecht and of Vienna diplomatists carved states as if they were so many Dutch cheeses, without any regard to the wishes and interests of the people who lived in them. But this argument is both irrelevant and unhistorical. The disregard of that real though undefinable force which we call nationality was no essential part of the doctrine of the balance, but was a vice of the time when those settlements were made. It must never be forgotten that the principle of nationality, or, in the current formula, the right of self-determination, is a growth of the nineteenth century. To blame earlier statesmen for its disregard is as preposterous as it would be to condemn the peoples of ancient Greece and Rome because they were not believers in Christianity.

Another almost equally questionable argument is that in the intervening periods between the great struggles, when the aim of diplomacy was to maintain an existing balance rather than to restore a balance which had been upset, European states, our own included, have adopted expedients and alliances which critics looking backwards condemn as immoral or inexpedient. They may have scented danger in the wrong quarter, their precautions against one state which was reputed dangerous may have contributed to exalt a more formidable enemy, or they may have pursued a policy which they afterwards had reason to regret, as when we bolstered up Turkey in order to check the aggrandisement of Russia. All

these charges, though they frequently fail to allow sufficiently for contemporary forces and conditions, may be admitted without weakening the contention that a reasonable balance of power is both desirable and necessary. Neither statesmen nor public opinion have any claim to infallibility. The most democratically controlled diplomacy that the ingenuity of Mr Trevelyan or Mr Ponsonby can conceive will make at least as many blunders as the oligarchical diplomatic service which they condemn has committed in the past. The detection and condemnation of past errors, whether real or merely alleged, cannot alter the fundamental historical fact that the policy of maintaining the balance of power, and of restoring it when momentarily destroyed, has saved the lesser states of Europe from extinction, has averted the establishment of a soul-destroying despotism, has rendered possible the assertion of the principle of nationality, and has enabled the foundations to be laid of a system of international law. The experience of the present war has shown how impotent are the sanctions of international law when any single state is strong enough and immoral enough to defy them.

There remains the favourite contention of the present time that the doctrine of the balance of power has had its day, and that it can now be laid aside. In its place is to be erected a League of Nations. President Wilson has given his approval to this contention, and Mr Arthur Balfour in the House of Commons has somewhat hesitatingly shown an inclination to accept it. But it is equally reasonable to contend that the restoration and the maintenance of the balance of power are essential conditions without which no League of Nations can be formed or can discharge its desired functions. If a single Power and its confederates can defy the aggregate strength of the other Powers, the league is condemned to impotence, and international law becomes a mockery and an illusion. Such a Power, if it joins the league, can dictate its will to its associates, and the league ceases to be an association of equals. If it breaks away from the league, no sanction is strong enough to punish its recalcitrance. The ultimate resource of the most pacific league must be armed force, and if that is inadequate, no milder measures, not even an economic boycott, can hope to be successful.

Meanwhile these speculations as to a distant and utopian future are exasperatingly futile in face of the incontestable facts that the European balance is at the present moment in greater danger than at any time since the compact of Tilsit, that the collapse of Russia has been as disastrous as was the desertion of the allied cause by Russia in 1807, and that Europe has no hope for the recovery of its freedom or for the establishment of a secure peace until the balance of power has been restored.

## THE FORESTER'S GIRL

## CHAPTER XVIII.

DEEP dusk had already fallen when David Hardy, every shred of his clothing exuding the pungent smell of bush smoke, his face and hands blackened with charcoal, turned his horse into the corral and entered his cabin. All trace of his ill-humour of the previous evening had been routed by his long fight with the fire demon before whose flaming sword even the patriarchs of the forest are doomed to fall; and it was, moreover, for a man habituated for many months to a hermit life, a heartsome thing to see cheerful lights a-twinkle in the windows, to have his hungry nose assailed by an aroma of venison stew, and, on opening the door, to find a young wife with hot cheeks and bright eyes peering anxiously into the oven, where some dozens of fluffy biscuits were turning golden-brown.

'Can't kiss you, darlin',' David exclaimed as Anita sprang up to greet him. 'I'm as black as any nigger from that cursed smoke! But just you wait until me and the wash-basin have exchanged compliments, and then I'll make up for lost time!'

Anita laughed, and hurried to fetch a large, rough towel; while the forester filled a big basin, in whose depths he was soon splashing and spluttering. During the process his nimble tongue, unquenched by soapy floods, told Anita fragments of news about his day's task: how the fire had not been long started, but, as was often the case, had repeatedly outcropped by burrowing underground to points quite distant, and it was this that had detained him so late. 'Never any tellin',' he gurgled from among the soap-suds, 'when or where a mere pin-point of fire may pop out again and run up a tree like a lamp-lighter! Well, now to get some of these blamed ashes out of this mane o' mine! Any warm water handy, darlin'?' and the hot water supplied, the black curls were speedily immersed, streams of gray ooze pouring down his forehead. But, even so, David could still talk; and presently, as Anita crouched once more at the oven door, she heard his half-drowned voice saying, 'Went off in such a hurry this mornin'—ppf—ppf—forgot all about that campin' party's bread—ppf—ppf-f. Chuck me the towel, please, Annie. Guess I'll have to hit out with it after supper. Ppf—ppf—Lord, I feel like a drowned rat!'

Now Anita's thoughts had been concentrated upon the biscuits, whether it were better to turn the pan round so as to give those nearest the oven door a better chance of browning as David liked them. Therefore, quite unthinkingly, she said the first thing that came into her mind: 'Oh David, you'll be too tired after supper.'

Then, instantly realising that she had made a blunder, and thankful that the hot stove was sufficient excuse for the sudden burning of her cheeks, she added, 'Besides, he came for it himself.'

By this time, however, her husband's head and ears were so completely enveloped in the heavy towel, and so deafened by the fierce rubbing, that Anita's remark, spoken low and with her back towards him, failed to penetrate. With thumping heart she awaited some comment, but as none was forthcoming, snatched eagerly at the thought that, for the present, there was no need to say anything further. After supper she would tell him all about Gavin Barrie's sudden appearance.

'Now!' exclaimed David, emerging from the towel and running a comb through his glistening locks. Next, with a merry whoop, he swooped down upon Anita, rubbed against her soft, flushed cheek his beard of two days' growth; then, fired by the contact with her sweet face, suddenly snatched her up in his arms and rained true lover's kisses on her lips. 'There!' he exclaimed at last, popping Anita down into a rocking-chair; 'if that ain't meat and drink to a hungry man, my name ain't David Benedict Hardy. No; you just sit still, darlin', and I'll dish the supper. I reckon that's my share o' the job; and you're some tired, too, I'll bet.'

Anita protested, but David had his way; and presently he pulled her forward, chair and all, shoved the wood-box under her feet, and then, with loud commendations of the stew and biscuits, rapidly disposed of a much-needed meal. Between them the dishes were quickly cleared away; and then David, having replenished the stove, sank into the comfortable rocker, gathering Anita on to his knee, and weaving his fingers in and out of the hair that lay so soft against his shoulder.

'Well, if this bain't a cinch!' he chuckled contentedly, tightening the arm around his wife's slim waist. 'Talk o' bein' President of the United States, and livin' in the White House! Why, he bain't in it with yours truly! Gettin' sleepy, ain't you, darlin'?' he asked presently; then suddenly, as the clock jangled out eight rasping strikes, he exclaimed, 'Oh lordy, blessed if I bain't gone and forgotten that fellow's confounded bread again! Can't help it! He'll have to fall back upon flapjacks for breakfast. Won't hurt him, and I'm too plumb-tired to foot it all the way to Goose Lake in the dark. Sorry, Annie! Did I pinch your little hand?' he asked crooningly, feeling the girl in his arms suddenly flinch. Then, as a pine-knot

in the stove blazed up, throwing red tongues of light over Anita's face and hair, he said, looking intently down upon her, 'Gee, darlin', you're gettin' prettier at the rate of ten dollars a minute! Shame you ain't got a better-lookin' partner!'

Anita, her mind whirling distractedly, found no answer ready to her lips, so, as though in mute remonstrance, she raised David's free hand, and kissed it fervently.

'Don't waste kisses on these horny old fingers, darlin'!' he expostulated, and dumbly pleading, bent his face to hers, and got his full reward. Satisfied, he folded her yet more closely, and resting his head against the chair-back, presently dozed; while poor Anita lay passive in his arms, hating herself for what seemed a deliberate deception, yet utterly unable to bring herself to the point of telling him the simple truth, lest his smouldering jealousy be again fanned into hot flame. Her brief remark as to the camper having fetched his bread had evidently been unheard by David, and what should she say to him if, in the morning, he suggested taking it to Goose Lake?

All at once her torturing thoughts were interrupted by prolonged snores, then a snort, and with a writhing of cramped limbs David woke. 'Hello, Annie! Guess I must have been asleep. Reckon it's gettin' late, too, and that "downy" is the best place for both of us. Come along, little girl,' he added drowsily, setting Anita on her feet; and in less time than it takes to tell, the chorus of snores was again in full voice.

Not so with Anita. No sooner was her partner fathom-deep in slumber than the girl, burying her head in her pillow, gave way to a passion of hot, stinging tears. Vain now to upbraid herself; but why—oh, why had she not told David at once of Gavin Barrie's visit? The chance was there; yet she, like a coward with guilty conscience, had let it slip. Through her brain ran Gavin's own words—not by word or deed had he wronged her husband, yet her very silence as to their encounter and his coming to the house would inevitably give David a wrong impression, injurious alike to herself and to Gavin. What if, blinded by jealousy, he should believe the very worst of them both, should cast her out of his home, or seek out Gavin, and—Cold with a sudden awful fear for the sake of the man who had been so good and true a friend, she sat up in bed and strove to think calmly. What could she do to retrieve the fatal blunder she had made? Could she slip out and, in spite of the darkness, find her way to Gavin's camp, and implore him to leave the district? Vain—vain. Not for worlds, she knew right well, would so true a gentleman as Gavin Barrie slink away like some evil-doer or leave her alone to

face her husband's anger should he learn the real facts. No; when morning should come, there would be but one course open to her—to fling herself on David's mercy, and, by sheer force of tears and prayers, make him believe her true to him, and Gavin Barrie true to them both. Not for an instant did she seek to excuse herself, or to blame her husband should his jealousy indeed 'burn like fire.' That his own hasty, suspicious temper was in great measure responsible for her seeming deception, and therefore infinitely more culpable, formed no part of her simple, unsophisticated philosophy.

At length, mind and body exhausted, Anita fell into a heavy sleep, from which she was not roused even when David, long wanted to early waking, rose quietly and slipped away to the corral to feed his horses. On his return, there being still no movement in the bedroom, he gently closed the door, lit the fire, prepared breakfast, and carried to the bedside a cup of well-made coffee.

But Anita still slept, and her husband, observing her closely, noticed that, instead of the usual rosy flush which was his daily delight to see, her cheeks were pale and dark shadows lay beneath the closed eyes. 'Best let her sleep,' he said to himself. 'She's been workin' too hard, and looks wore out. I'll just put the coffee to keep hot, and hit out for Goose Lake. Mebbe that fellow'll be needin' his grub.' Drawing the curtain to keep the rays of the rising sun out of Anita's eyes, he wrote a few lines on a bit of paper, and, still without disturbing her (for a woodman's life had made him stealthy as an Indian), arranged a sort of scarecrow out of her clothing at the foot of the bed, pinned his note to it, and, chuckling over the ludicrous appearance of his handiwork, returned to the kitchen.

A hasty wash and shave, and then, searching the cupboard, he found an uncut loaf, and, without reflecting that there should have been two, wrapped it up and set out on his good-natured errand. Just outside the door his attention was caught by a small object gleaming like gold where the sun struck it, and stooping, he picked up the burnt end of a cigarette; not the brown-paper, home-rolled cigarette of the West, but a gilt-mounted product of a more luxurious part of the world. A perplexed frown knit the forester's brows as he turned the fragment over and over, smelled the delicately flavoured tobacco, and finally, scarcely knowing why he did so, stowed it away in his pocket. Then, with an abstracted air, he strode down the road, and soon turned into the shadowy trail which, the previous morning, Anita had pointed out to Gavin Barrie as the short cut to his camp on Goose Lake.

(Continued on page 341.)

## SCOTTISH STREET NAMES.

By G. M. FRASER, Librarian, Aberdeen Public Library.

UP till the middle of the eighteenth century the street names of Scotland and northern England followed a clearly defined rule. They were all strictly descriptive; that is, they were not applied as names in the considered, formal way that has been the fashion since. They grew up in a natural way as designations of the thoroughfares according to situation, or character, or use.

From this circumstance the older street names are very valuable now as indicating local conditions that in many cases have long since passed away, and are only to be known, perhaps, from these old street names. Thus, the Cowgate, a common street designation in the older burghs, tells us of the road along which our forefathers of the primitive community drove their cattle to the common grazing outside the town. The name Spital, which occurs sometimes as a street name, but oftener in wilder parts of the country, always tells of a hospital, or hospice, in former days. The Spital of Aberdeen, the street that connects Aberdeen with the adjoining burgh—erroneously styled Old Aberdeen—and the street in which George MacDonald dwelt as an arts student at Aberdeen University, recalls the Hospital and Chapel (dedicated to St Peter) founded by Bishop Mathew Kyninmond in the twelfth century, and the street name is now all that we have to inform us as to where the ancient hospital stood.

The commonest element in the historical street names of Scotland and northern England is the expression 'gate,' as in Castlegate, Trongate, &c. The history and use of this expression illustrates the story of our Lowland Scots dialect generally. It happens that many of the streets containing this expression in their names formerly had in them the old gateways of the town. But this expression has nothing to do with gateways in that sense. These were always known, not as 'gates,' but as the 'ports,' of the burgh (Fr. *la porte*, the gate)—such as the West Port, the Seagate Port, and so on. The expression in the street names is the old Anglian *gate*, a road or way (Old Norse, *gata*), and in this sense the expression is proverbial in Scotland. 'Down that gate,' the old people used to say, meaning 'down that way;' and Burns uses the word in this correct sense in the opening of Tam o' Shanter,

As market days are wearin' late,  
And folk begin to tak' the gate,

meaning, to take the road. So the street name Castlegate, familiar in many old burghs, is the Castle Road; the Gallowgate was the road to the Gallow-hill, outside the burgh, where the meaner sort of offenders were hanged; the

Trongate was the road to the Tron, or public weigh-house; and so on. This proper meaning of the expression, one ought to say, has been nearly lost sight of in Scotland. I observed not long ago that in Ayr the name of the old Sandgate—the Road to the Sands—has been painted up 'Sandgate Street,' making a tautology, which in Ayr is particularly bad. Lanark makes the same mistake with 'Wellgate Street;' and even Haddington, which has some fine old street names, offends with 'Hardgate Street,' which is the Paved-Road Road!

Much enlightening history is embodied in these old names. The Wellgate of Dundee is the road—the gate, or gait, as it came to be spelt in Scotland in later centuries—that led to the Lady Well, the public fountain of the burgh, to which the water was conveyed from the springs of the Law Hill (also a tautology), the Hilltown, and elsewhere. The Gallowgate of Aberdeen led to the gallow-hill, where, as late as 1776, a wretched man was hanged in chains for the murder of his wife.

The use of this expression is common in English towns as far south as York, Leeds, Manchester, Stafford, &c. The Greengate of Stafford (although this has been forgotten in the town) led to the old borough green, outside the walls; and the Gaolgate is the street that still leads to the county prison. It may be remembered that it was in the Eastgate of Stafford—the East Road—that Izaak Walton was born in 1593.

Nearly every historical town in Scotland has a High Street or its equivalent—with one exception, Aberdeen. The expression 'High,' in this sense—'as every schoolboy knows'—is the Anglo-Saxon *heah*, meaning chief, or main. The reason why there is no High Street in Aberdeen is not well known, but is quite historical. The main street of Aberdeen is Union Street, a fine avenue, begun to be made in the year 1800, the year of the Union of the Parliaments of Great Britain and Ireland; hence its name and the names of other Union Streets in various towns. But before Union Street was made Aberdeen was a small, compact town, with a number of short, ancient streets, not one of which was in any sense a main street. So there was no High Street, although there is a High Street, properly so called, in Old Aberdeen, but it goes back only to the sixteenth century.

It is curious to find that some towns have two main streets—that is, both a High Street and a Main Street, meaning the same thing. Ayr offends in this matter, too; and Dunfermline, which does not seem to be aware that in 'Kirk-gate Street' it calls its thoroughfare Kirk-Street

Street, 'maks siccar' by having two main streets like Ayr.

Any wretched, narrow passage in a Scots town used to be designated a vennel, but only where there were a number of such, as in Perth, the ancient capital, did they get distinctive names—the Meal Vennel, Butchers' Vennel, &c. This is a different element from the Anglian 'gate.' It is one of the many French expressions we got through John Baliol's famous Franco-Scottish alliance, and is *la venelle* of the French, meaning a narrow, mean street. It is astonishing how widespread this designation as a street name was in Scotland. We had it in practically every historical burgh, from the Black Vennel of Inverness, and the Little and Muckle Vennels of Cromarty, to the Glasgow Vennel of Irvine, where Burns worked as a flax-dresser, and the Wee Vennel of Dumfries, where also Burns dwelt. This idea of meanness was so associated with the expression 'vennel' in the Scots mind that it was applied to any place so utterly squalid that in the forcible Teutonic it might otherwise be termed a pig-sty.

Other French elements are to be found in our Scottish street nomenclature, although not the expression *rue*, as seems to be thought in Greenock, where Rue-end Street seems to suggest a wrong derivation of 'row.' But a true case of French derivation is the designation 'Causeway-end.' It is *chaussée*, the paved way. We must not suppose that all the multitude of French words in common use in Scotland came through the old alliance between the two nations, and Francisque Michel's remarkable lists in his *Critical Inquiry into the Ancient Language of Scotland* must be carefully used, but it is quite amazing how widely and deeply the French influence penetrated Scottish life in this way. But the matter has been admirably treated by Professor Gregory Smith in his monograph on Middle Scots, and it is well worthy of the study of all who are interested in the derivation and history of our mother-tongue.

All the street designations so far dealt with are common to Scots burghs generally. But most of these burghs have descriptive street names—quite ancient, and arising in the old natural way—that are peculiar to themselves, and are derived from strictly local conditions. The Overgate and Nethergate of Dundee, although names peculiar to Dundee, do not come into this category, because they are intelligible to any one of knowledge in such things as the Upper Road and Lower Road—names of general quality, although restricted to local application. The same is the case with the old Boulget, or Bowlgate, of Edinburgh, for there were other places that had a public bowling-green, with the road leading to it known as the 'Boulget.' Such a strictly local designation is the Guestrow of Aberdeen. There is no other Guestrow in the country, and although this is a remarkable case

of a misapprehension, the name in its correct form, as well as in the corrupt form, is absolutely unique.

In the older histories of Aberdeen the name was explained as meaning the street where the townsfolk lodged distinguished strangers as guests. It so happens that this old street did contain the residences of provosts and other prominent citizens, and in one of the finer buildings—still standing—the Duke of Cumberland was lodged for several months while on the way north to Culloden in 1746. But that idea of the meaning of the name was quite erroneous—as, indeed, might have been seen if people had remembered that Aberdeen was not the only town that entertained strangers, although the only town that had a Guestrow.

The key to the puzzle was found in the old Latin title-deeds of the properties in the Guestrow of the fourteenth and fifteenth centuries. The little street was described there as *Vicus Lemurum*—Road of the Spirits. In those days nothing intervened between the sloping back-gardens of this street and the graveyard of St Nicholas Church, the mother-church of the town, and it was seen (and there is now ample corroborative evidence) that 'Guestrow' is really the Ghaist Row, where the spirits of the departed from the adjoining churchyard might possibly be met with.

Since the later years of the eighteenth century the streets in Scottish towns, like those elsewhere, have been formally named, and the names now follow no rule of any kind. The case of the Union Streets of various towns is an instance of an excursion into general political history. Constitution Road of Dundee is another. That steep acclivity has not been the resort of Dundonians for a morning 'constitutional,' as the name might suggest. It takes us back to the opening years of the century, when the Catholic Emancipation proposals set the country by the ears. Scotland was very much opposed to these proposals, as was the king, and Scots burghs were zealous in voting addresses to His Majesty for his resolution in standing up for the constitution. Dundee and other towns carried their enthusiasm so far as to name one of their new streets Constitution Road, or Constitution Street, in commemoration of this national episode.

Such political references in street nomenclature are pretty likely to be regretted afterwards (though they are hardly likely to be very numerous in Scotland), but literary references are rather different. A group of streets in the west end of Aberdeen are named Rubislaw Terrace, Albyn Place, and Waverley Place. They were laid out in the late twenties of last century on part of the lands of Rubislaw, the patrimony of W. F. Skene, historiographer of Scotland. The Skene then in possession was W. F. Skene's father, James Skene of Rubislaw, the intimate friend of Sir Walter Scott. Rubis-

law Terrace was so named from the family property. Albyn Place was named from the street, in the new town of Edinburgh, where James Skene dwelt; and the adjoining Waverley

Place was named to mark the association of Skene of Rubislaw with Scott, who by this time had made the famous public acknowledgment of his authorship of the Waverley Novels.

## 'C'EST LA GUERRE.'

By JEAN COCHRANE BRANTS.

OUT here in Switzerland we are living in an atmosphere of pet economies. I am sure Miss Matty, of blessed memory, would feel almost as much at home among us as in her native Cranford. Candle-ends, tails of string, and scraps of paper—what a new spirit has quickened their worthlessness! The common has become new, the vulgar distinguished. Matches, and soap, and cotton thread are teaching the dullest a new respect for the labour of man.

And the bread cards, the cards for the coal and the rice, the sugar and the macaroni, are working a revolution, social and moral. They are all the colours of the rainbow, and bear on the back this awful warning: 'This card is personal, and under no circumstances can it be replaced;' truly a responsible possession, therefore.

'*Ces cartes m'énervent,*' wailed our apple-woman as she stood emptying her pockets and bags on the kerbstone in a frantic search for what was not there. A month without bread or sugar is a common kind of nightmare here. When butter, milk, and fat cards are added, this night fear no doubt will come to be

the frightful fiend

Who close behind us treads.

'*C'est la guerre,*' says the good-natured Vaudois, and feels he has said the last thing about the situation. And with an equanimity truly admirable, he buys his coals and bread and sugar *à la carte*!

'*C'est la guerre.*' He says it to every new police regulation which complicates life for him.

'*C'est la guerre.*' He says it after three hours in the market-place waiting for butter. He has been known to say it when, his turn come, he finds no butter left.

'*C'est la guerre*' said even the old market-woman who offered me a swede for ninepence. I expostulated, but it was of no use. '*C'est la guerre,*' and there the matter ended.

'*Ah! c'est la guerre,*' when it rains, when it snows, when the linen is not clean.

'Two bits of soap?' growls the washerwoman. 'I cannot wash you clean on that.' Now was my turn. '*C'est la guerre;*' and I went on calculating how often we could still wash with soap at all.

We were sailing on the lake that last still autumn day before the bread card came. Dipping, sweeping, wheeling round us was a cloud of gray-winged seagulls tensely watching for the bread that never failed. Such a feast

they had, too, for the last time, and never a crumb touched the water, so unerring was their eye. Next day was the same whirling mass around us, following through the misty evening. A curious silence held us on the boat as we watched their flight and listened to their lonesome crying echoing o'er the water.

'*Personne vous a dit? C'est la guerre! Nous avons tous la carte de pain,*' came a small voice from far behind.

And often as I use my card I am back again on the still lake, with the swish of the water in my ears and the cry of a seagull calling—calling for bread; and sometimes—is it fancy?—voices mingle with the cry.

In this Island of Peace we think, we speak, we hear of nothing but the war; and it would be wrong to imagine that Switzerland does not acutely suffer. She is not a self-supporting country by a long way, and is dependent on her neighbours for the necessities of life. She is absolutely dependent on Germany, for instance, for coal and iron, which is not even *promised* without compensations. The Allies, on the other hand, limit all importations through onerous restrictions, lest aught of theirs pass to the enemy. A slight consideration of this situation reveals what dainty steersmanship is needed to guide this ship of State.

Now, since the war Switzerland has become not only the refuge-haven of the wearied and suffering, but the very refuse-heap of Europe. The foreign element is ridiculously high. It is possible to walk through the principal streets of Lausanne and Geneva and not hear a word of French. The Swiss refer to these alien immigrants as monkeys, thereby vastly relieving their minds. This baboonoid designation, originally given only to foreigners of a darker hue, is now becoming the general name for us all! During these days of rationing, it is a real hardship to see so many strangers pouring into the country and crowding hotels and tea-rooms. But we must remember that, as hotel-keeping is one of the chief industries of Switzerland, this situation could not be interfered with without ruining a large proportion of the population. It would not be surprising, however, if the people who suffer most were to forget this. With the exception of the Zurich riots, now proved of German instigation, the calmness of the Swiss is beyond all praise.

There has been much criticism, much suggesting, much writing 'to the Editor' by flustered

citizens, anxious to cope with the undesirables, so looming an element in this foreign crowd.

Scarcely a day passes without some alien name figuring in the criminal columns for spying, or theft, or murder even, with this note appended: 'Needless to add, this monsieur enjoyed a supplementary bread card.'

This is truly hard to bear, especially in *la Suisse romande*, where, as in France, bread is the staple food of all classes. '*Ces messieurs de Berne ne comprennent pas ça*,' complains the Vaudois, who cannot get over the fact that his German-speaking brother, who eats little bread, enjoys the same ration as himself. Though it is difficult to see how the gentlemen at Berne could have arranged it differently. Certainly the introduction of the bread card has shaken the foundation of our life and put the fear of death on the peasant, who sits on his potatoes like a hen on chicks. To oust him from this place of privilege if not of honour remains the problem, and to make him share with his fellows of the towns! Our farmer himself promised me my potatoes right heartily in autumn. Ever since I have been keeping him in mind. First it was too wet to dig them up, then too fine to miss a day in the fields; then the frost came. Each member of that family had his good reason why the potatoes could not be sent to-day. By Christmas I became alarmed. Impossible to get them *anywhere* if the farmer did not keep his word. After a minute and searching investigation two facts came to light. The farmer was drunk when he promised, and his wife, in mortal fear of the bread card, would sell nothing.

It would be difficult to exaggerate the milk troubles of last November. For two days on end we got no milk at all; that was how we first learned that troubles existed. The apology offered was concise. With cows on 'dry' fodder and oil-cake wanting, milk was reduced by half, and badly divided! Since, though times are better, there is often a day when the dairymaid 'forgets' to call.

Butter is hardly mentioned among us. A man in the town who sells it has ruined a gentle character. Before this war, never was a pleasanter salesman. Now he rarely smiles. He wears the expression of a man robbed. When his butter arrives from the central depot a placard appears over his door: '*Pas de Beurre*.' He locks himself in for the afternoon. But the queue outside holds firm, and he has to open the door in the long-run.

Cheese is becoming a scarcity. Through a miscalculation at the beginning of the war, exportation reduced the stores too rapidly—a tragedy in a country where it is a staple food. Not a mountain chalet without its well-stocked cheese-room, the trial of the summer visitor, who finds it impossible to grow accustomed to its odour, so pungent in changing weather! Winter's trial, the odour of choucroute, also is absent this season. In the cheaper restaurants and shabbier

boarding-houses from morning till nightfall a faint but irritating acidity pervades the atmosphere in normal winters—choucroute. This is likewise a staple dish, and a dainty to boot, when properly treated.

This year the caterpillars have saved us—a salvation not altogether to be applauded from the point of national economy. It was in the warm summer days that the butterflies came, living snowstorms flitting over the country. So beautiful and innocent they seemed! The air was full of them, the fields a dancing white. The Dance of Death, we called it as we watched them day by day. The plague of caterpillars that followed devoured everything to their taste. The cabbages with naked fingers pointed skyward like witches' brooms; and everywhere—on the ground, on the roads, over the walls and the houses—were nothing but caterpillars crawling, crawling. So choucroute is scarce and very dear this year. The peasants make a substitute of turnips, and, ready for eating at every market stand, beetroots are sold that have been cooked with the pig's meat!

Fruit also helps to fill the aching gap. Fortunately last year the crop of apples was abundant, and now they are more plentiful on the market than potatoes. Unfortunately, again, apples require sugar, and for long months that has been our most coveted possession, or rather *want*. Distracted advertisements used daily to appear in the papers from people ready to exchange, for a bag of sugar, anything in creation or imagination—butter, pigs, coals, potatoes, or perambulators!

Now that the fiercest frost in memory has come upon us, these advertisements have changed their tune. Sugar is offered for coal. We have stopped talking condiment in our struggle for warmth. Indeed, coal is a most serious difficulty, though all has been done to mitigate the distress. All last summer the Swiss were allowed to gather wood in the forests near the town, and every morning whole families, grandmothers and babies included, might be seen toiling up the hills, pulling every variety of hand-cart and barrow, to return in the evening laden with pine-logs, and the baby asleep strapped on the top. Now in winter these same hand-carts are ever on the road to the gas-factory fetching the monthly allowance of coke.

'Cannot you send my coke?' said a simple-minded new-comer to the distributing officer.

'No, madame; and it's very heating to fetch it yourself.'

Every month, alas! this allowance becomes easier to carry. Trains every month become fewer; factories are stopping; hotels are only half-full. This lack of fuel has forced Switzerland to inspect her own mountains and peat-moors, and a poor anthracite has been found in the Valais which burns only when powdered and mixed with peat. The briquettes made of this mixture burn, but give little heat. And the modern

house, with its central heating, has become a grave problem.

But perhaps the greatest trial of all is our gas ration. Gas cooking has always been encouraged here, and most houses are fitted with gas-stoves; but the allowance is steadily diminishing. It is many months since baths were forbidden, and woe to the person who exceeds her limit! So,

many an anxious housewife out here spends much of her time on top of a ladder watching her gas clock. Once more—*c'est la guerre*.

'*Qu'il y soit au moins du pain*,' is the heart-felt cry of the people. 'Gas, coals, sugar, we may do without; but give us bread. Be it ever so old, ever so sour, give us our daily bread.'

## SMALL HOLDINGS AFTER THE WAR.\*

By THOMAS NORTH CHRISTIE.

SMALL holdings as a means of keeping people on the land and as a 'guid-ganging' platform plea have had much attention for many years; and now, as we all hope, the blessed day draws near when swords may again become ploughshares, an increased and wider interest is being taken in such settlements, with the expectation that in them may be found homes for many of those who have served their country so gallantly and well.

It is true that the effect of recent legislation and the effort to promote small holdings has been very disappointing, both as regards the creation of new holdings and the settlement of existing ones. The new holdings have even failed to equal in number those that have ceased to exist in the same period, and the cost to the State has been preposterous. The settlement of the older holdings by the Land Court has, in the main, been on the simple, popular principle of giving a pound's worth for twelve or fifteen shillings; but such a system ends the creation of holdings by private arrangement, and intensifies what is really the crux of the whole problem—namely, the provision of buildings. One instance, the Duffus case, will illustrate the point. A small tenant in 1903 lodged with the owner an offer to continue his lease of the holding at an increase of rent from twelve pounds to sixteen pounds, provided the owner put up new buildings at the estimated cost of two hundred and ninety-four pounds fourteen shillings. The offer was accepted, and the buildings were erected. When the Land Court was instituted, the tenant applied to it, and the Commissioners, ever ready to be benevolent at some one else's expense, reduced the stipulated rent from sixteen pounds to eight pounds. For this annual payment (out of which the owner has to pay rates and maintenance charges) the tenant gets three hundred pounds' worth of buildings, twenty acres of arable land, and some out-run; which out-run, he admitted, sometimes produced a rent of five pounds for winter grazing.

The interference intended by the legislature

probably had justification. There are land-owners who would, if they could, charge a tenant rent for improvements executed by the tenant himself, and similar exceptional land-owners might trade unfairly upon circumstances that would practically compel a tenant to agree to an inequitable rent rather than be turned out of his old home. No one will quarrel with the setting right of such wrongs, and it is not, therefore, the *intention* of the legislature that is to be blamed, but the way the intention has been interpreted by the majority of a body that should be, but is not, impartial.

All those who have at heart a wish to see small holdings increase and succeed will rejoice that of late a saner view of the relative positions of land-owners and small-holders seems to be making way. Sir George Younger and Mr Wason have joined in a deputation to the Scottish Secretary; and, later, Mr Munro invited the largest land-owners to discuss the problem with him; so, at last, one may leave the party side of the question to dwindle before patriotic common-sense. No one does, no one can, doubt the desirability of keeping people resident on the land, and few, outside Westminster, care a pin's head whether they remain as small proprietors or as small tenants so long as they remain and brighten and strengthen the country with well-filled quivers.

The writer has had opportunities of ascertaining facts and watching tendencies not only in Scotland, but in other countries, and, wish as one may, there is no use in being blind to facts 'that winna ding,' or imagining things to be as one thinks they should be. East or West, in every country, just in proportion to the progress of 'civilisation,' the tendency amongst the younger people is universal, and it is to seek the towns. They prefer town employment, town distractions and society, to the more wholesome but humdrum existence that their forebears were content with. The standards of living have changed, too, and a holding that supported a family a generation ago will not support a family now. Buildings that suited the old folk and housed them in their joys and sorrows to ripe old age will not now pass the county inspector, and rightly so. The frugal grandparents and parents toiled and

\* The Editor recognises that certain statements in this article are open to controversy, but as the subject is exciting attention, he thinks Mr Christie's paper will be read with interest.

moiled as their descendants of to-day will not. They are not to be blamed; life has been made easier for us all, but it is better to recognise facts and not cherish the idea that deer-forests or grouse-moors or land-owners' rents have been the main cause of what we regret and would fain remedy. The old folk, who knew not bicycles, cinemas, or excursion trains, die off, and in the more distant glens and hillsides it becomes increasingly difficult to get the younger folk to remain and carry on. However sympathetic and patriotic in the matter we may feel, let us not be led away with false ideas of the small-holder from an agricultural point of view, but, rather, in his interests, let us keep clearly in view the changes that time has brought about. Sentiment, particularly in the Highlands, is strongly in his favour; patriotism sees in him a man with a stake in the country, and, as such, a source of strength; while eugenism hails him and his environment as one of the chief palliatives to the degenerating influences born of the manufacturing-city conditions. But as an agricultural proposition he is much less desirable; he does not cultivate as well as the large farmer; his limited acreage means small fields, with consequently a greater waste in fences and roads, and handicaps him in the use of the ever-increasing labour-saving appliances. Conditions suited to the spade and the sickle will not suit the double-furrow plough or the binder reaping-machine, far less the tractor. His buildings and his water-supply cost very much more per acre, both in construction and maintenance, than the single set required for the big farm. The small-holder has suffered by reason of the indifferent land that has been his portion; for the fat land, if there was any, went to the large farmers. There are friends of the small-holder who even yet would condemn him to that handicap, and vainly try to plant him in the glens of the deer-forests and moors. When the Secretary for Scotland speaks of Borgie as being suitable for small-holders, he allows his appreciation of the Duke of Sutherland's generous gift to warp his judgment. It is true that one should not look a gift horse in the mouth, but you need not regard the gift of what is but a Highland sheltie as if it were a thoroughbred.

Borgie's rough land, forty miles from its railway, will never make successful holdings, and the Board of Agriculture will need to be relied on to camouflage the failure by forestry—a delightful budget-heading to play with when the day of reckoning runs into the next century! Indeed, Mr Munro condemns his own opinion; for, while with one breath he speaks of Borgie as being suitable, with the next breath he complains that he cannot get land; and yet a quarter of a million acres adjacent to Borgie, but nearer to the railway, were then in the market. If you pay a high wage for doing an easy day's work on a government job, you will, of course, get

men to live at Borgie, and they will appreciate comfortable houses with land attached; but they will not really be permanent small-holders, and if the government spoon-feeding ceased they would soon dwindle away. The number of men who at the conclusion of the war will wish to become small-holders, and who are fitted for agriculture, is problematic, and perhaps the wish is parent to the thought that they will be a very large number. On the other hand, some of those previously engaged on the land will be unsettled by their war occupations, and may be reluctant to return to their pre-war ploy. It is difficult to understand why we have up to now neglected a class that can be added to the category of small-holders with greater ease and in greater numbers than the agricultural class proper hitherto aimed at. In the vicinity of all the country towns (cities are a different problem) there is an eager demand for homesteads with a few acres of land—perhaps up to eight or ten acres. The applicants cannot expect to get such places at a rental of some shillings per acre, and they are willing and able to pay a sum combining a house rent with a fair agricultural rent. They and their families will benefit by country surroundings and fixity of tenure just as much as any other class, and the fact that they are wage-earners in the town, as well as small agriculturists at home, does not make them a less valuable asset. Such a class of workers' homesteads, within a mile or two of the towns, would be much more attractive to, and suitable for, our returned soldiers than more rural holdings. The kindred idea of combining government work on forests with small holdings cannot be so quickly given effect to, and the mere fact that these holdings must be near the potential forests condemns them to situations with less favourable conditions of soil and climate, where the chief inducement to go will be the government pay, not the small holding. The suburban worker's homestead class would be wholesomely independent of government subsidies.

To the writer there seem to be outstanding facts that must be faced when the extension of small holdings is being considered. They are: (1) To be permanently successful as an agriculturist, the small-holder must get good, accessible land. (2) His holding must be large enough to give himself and a pair of horses full work. (3) That no considerable stretch of suitable good land exists in Scotland except such as is already incorporated in arable farms. (4) When such farms are taken over for small holdings the existing farm buildings will practically have to be scrapped. (5) That the financial crux of the whole matter is the provision of the buildings, not the acquirement of the land.

Legislation should provide for both small ownerships and small tenancies with or without buildings. There is no reason why both demands should not be catered for, and the owning class

would often manage the building problem much better than the State can.

We have the Secretary for Scotland stating that land cannot be had, and that long leases block the way; we have the newspapers constantly advertising large extents of land for sale in every part of the country; and we have, at the usual periods, countless advertisements in the local papers of farms to let or of displeasing sales, showing that there are annually thousands of farms freed of lease.

Let the Secretary for Scotland circularise all land-owners having, say, more than five thousand acres of arable land, and ask them to state what blocks they would be prepared to sell to the Government. It would be strange if there was any lack of offers (provided, of course, that legislative sanction was promised in the case of settled estates); but if there was, the said land-owners might well have compulsion applied to them. The larger land-owners, apart from being patriotic, have generally more land than they want nowadays, and their areas are so large and often so scattered that big sections could be disposed of without ridiculous amenity or severance claims for compensation. Of course, in large blocks there would be leases to run which must be respected, and in some cases unwritten

leases that would only end with the life of the old tenant; but these leases would fall in quite as fast as the Board of Agriculture could deal with them. The worker-homesteads near towns, fishing-villages, or country manufactures should be settled by local authorities vested with purchasing and borrowing powers—the purchasing-power including that of qualified compulsion. Such authorities would, naturally, be much more discriminating and economical than any central body could be, and, what at this time is very important, they are constituted bodies ready for immediate action. Thirty odd County Councils, with some hundreds of the smaller municipalities acting as their ‘subs,’ could fix up holdings in really appreciable numbers available for returned soldiers or sailors, and relieving or preventing a good deal of town congestion.

In the judicious promotion of the settlement of *suitable* small-holders in *suitable* small holdings the Board of Agriculture for Scotland has a work before it which will tax its capacity to the utmost, but which, if successfully accomplished, will redound greatly to its credit, be of incalculable benefit to the nation, and justify the very large expenditure of public money necessarily involved.

## THE HAPSBURG-SEILERN TRAGEDY—1914-15.

By R. C. WYNDHAM, Author of ‘Predictions and Prophecies Relating to the Kaiser.’

THE story of the imperial house of Hapsburg for over a half-century has been one of disasters, intrigues, suicides, assassinations, and mysteries. From the defeat of Sadowa in 1866, and the consequent expulsion of Austria from the German Confederation, of which the Emperor Francis Joseph was the head, followed by the assassination of the unfortunate Maximilian in Mexico, down to the present war, the reign of the late emperor was one long train of tragic events—the mysterious murder or suicide of the Crown Prince Rudolph; the assassination of the Empress Elizabeth, and that of the Hereditary Archduke Francis Ferdinand; the extraordinary disappearance of the *soi-disant* John Orth, &c. To these is now added the latest crime, consequent on the secret affiance of a young archduchess of Austria (whose name has been skilfully concealed from the public) with an officer on the staff of his late Imperial Majesty, Francis Joseph, Emperor of Austria. To these crimes and mishaps might be added the sad story of Charlotte, widow of the Emperor Maximilian; the vicissitudes of the Princess Stephanie, widow of the ill-fated Rudolph; the misdeeds of the Queen of Saxony, and so on. Troubles and misfortunes were heaped on the head of the sovereign, many of them of his own making, from the moment of his accession.

What crimes, what intrigues, can be laid to his account!

The story of the love of Count Seilern (the young officer alluded to above) and the archduchess begins with the Christmas of 1913, when they met for the first time at a Court ball in Vienna. A mutual attachment sprang up between them, notwithstanding the difference of station, and the hard-and-fast rules of the Hapsburg dynasty, so severe in the matter of *mésalliances*.

When the war broke out in 1914, the count was sent with a detachment of troops to a village in Hungary, at the base. Here he had time to think of her to whom he had plighted his troth before leaving Vienna, and as the season of Christmas came round again, and as ‘absence makes the heart grow fonder,’ he felt a longing to see the lady of his heart once more. In fact, the desire became so strong that a secret meeting was arranged between them. Both hoped that notwithstanding their difference socially, and the haughty traditions of the Austrian Court, they would gain the emperor’s consent to their union; but it was not to be, as the sequel shows.

In order to effect the proposed meeting, the archduchess joined the Red Cross Society, and became a nurse in one of the hospital trains which circulated from field to field, picking up

the wounded soldiers. One morning one of these trains, with the archduchess and a few faithful attendants only, stopped near the village where the count was quartered. Nobody, as they thought, knew of her arrival; but Austrian espionage is as cunning as the arch-fiend himself, and the emperor's spies were on their track. While the two lovers conversed together, feeling themselves safe from vulgar eyes, a spy had been on the watch, and when the train was about to take its departure, and the two were exchanging a tender adieu (alas! never to meet again), there suddenly appeared on the scene General von Hoetzendorf of the Staff, accompanied by two of his officers.

Without doubt, from a point of view of Court etiquette, this meeting between the archduchess and Count Seilern constituted a grave scandal, but as a consummate courtier the general restrained every impulse and every display of disdain until the train was out of sight. Then he summoned the count before him, and demanded of him the reason of the interview. The latter, however, a prey to great excitement, broke out into violent invective against his superior officer, who, while waiting to bring him before a council of war, ordered him to be arrested and confined a prisoner in a house in the village.

The solitude of his prison induced the count to reflect upon the enormity of his acts, and he now considered what was best for him to do. Convinced that not only had he incurred the Imperial anger, which was much to be dreaded, but that he had also replied with arrogance to his superior officer, he knew that the consequence of his rashness would be very serious, and to save himself he determined to take refuge in flight, and to repair to Vienna, where probably he would find some influential friends who could succeed in having his punishment mitigated. The high rank of his family, and the interposition of the archduchess with the emperor, might drive away the storm, and prevent it from breaking in all its fury on his head. To escape from his prison, then, he determined not to stop at any crime, and one morning the two sentinels who guarded his door were found dead, and the prisoner gone. A baron (whose name has not transpired), who was his intimate friend, had prepared what he considered a well-concealed refuge for him, but the spy was at work, and knew of it. The scandal, too, commenced to get abroad, although every means was adopted by the Court and the Austrian police to prevent its publicity. It seemed, however, the best way was to remove the count at once and for ever quietly and secretly to that 'bourn from which no traveller ever returns'—in plain words, to put an end to him without any rumour. At first, for convenience' sake, it had been thought necessary to ignore his hiding-place, while keeping him always in view; but other methods must be adopted now.

The old Countess Metternich, the one person indispensable in Viennese Court intrigue, and Von Gagern, the Austrian Minister at Berne, two of the vilest tools of the Hapsburg Government, now enter on the scene. The countess proposed to the emperor to get Seilern privately out of the country. For this purpose a free passport was to be granted to him to cross the frontier into Switzerland, to remain there till he could safely get away to America, never to return to Europe. In Switzerland he would be met by Von Gagern, or his emissary, under whose protection he would be until the final arrangements were made. Such was the plot. Count Seilern was to choose between this and death, the punishment of his threefold crimes, the greatest of which in the emperor's eyes was the daring to pay court to an archduchess of the House of Hapsburg. The count had no choice. To remain was certain death; but by accepting the offer which the supposed mediation of the Countess Metternich had procured for him, he might at a future time be able to rejoin the lady he loved. He therefore started for Switzerland. An envoy of Von Gagern met him at the frontier, and also an intimate friend, an Englishman residing at Zurich, to whom he had written. Meanwhile Von Gagern had rented a house close to Lucerne, which, in his capacity as Austrian Minister, was extra-territorial, and here the count was to stay while awaiting the propitious moment to start for America. Thither his friend accompanied him, and then took his leave, returning to Zurich. Judge of the Englishman's surprise when next morning he got an anonymous telegram from Lucerne telling him to return there at once, which he did immediately. At the station he was met by some members of the Austrian police in the employment of the Legation, who conducted him to the house of Von Gagern, and there showed him the dead body of Seilern, who, they said, had taken poison. Was it suicide or murder? Von Gagern declared it was suicide; but who would believe him? As for murder—well, the Swiss Government would not care to interfere with the house of a foreign Minister, and so the matter was hushed up, some plausible story being given to the Swiss authorities. As a matter of course, the Austrian papers published nothing of all this; but now the whole secret has leaked out.

#### ADIEU.

ADIEU, adieu; the happy hours are flying;  
See in the west the sun's bed glows with light;  
He sleeps, his lullaby the soft wind sighing—  
So may you sleep to-night!

Adieu, once more; the long, glad day is ended,  
And overhead the crescent moon gleams white;  
She rests serene, by starry hosts attended—  
So may you rest to-night!

NORA C. USHER.

### THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

**T**HAT to see is to know and believe is an old and well-respected maxim. There is in it a deeper meaning and a better appreciation of one of the subtleties of human nature than might at first be fancied. It is not so much that we may not believe in the existence, the reality, the wonder—if there be any—of the thing we have not seen, but of which we have read or have been told upon authority, as that the cold narrative of its parts and properties does not strike with full force upon our senses. There is the impression of something being second-hand, of our missing the full value, and so we may be a little indifferent to our information, perhaps even disdainful of it. The people of London and other places certainly believed in the horrors of this ugly war, but they believed in them more—more even than they did when they saw their streets filled with crippled and wounded men—when the bombs began to fall from the moonlit sky of nights and killed their folk, and when a long arc of British guns played in the full blast of a deafening barrage. No matter of selfishness or blameworthy individual foible, this; 'tis but the difference between a story, a narrative, a tale of something far distant, and the living reality of personal experience that needs no words for its embellishment. Now one may have some vague understanding that the chief romance of the war is in the air, and that more of it may be there before the business is completely done. Here is great adventure, and something new and strange. But it is not that only. In the day-time our own machines, with wings grown so wide in these recent years, fly over the town, their engines singing loudly. We know of them, see them, and experience a direct effect upon our senses. And sometimes when there is danger we hear them climbing up the aerial passes, seeking for the enemy that provokes us; and later, upon the summit of air, as it seems, we have seen these joyous adventurers among the night clouds, crossing the face of the moon. At such moments imagination has danced and leapt. These men, who to-day at luncheon were among us, have by witchcraft of their own soared away from earth, and there they are with their guns and things, twirling about and racing in company one with the other through the silver

land of the very moon itself! We have seen this thing; it has not been merely told to us; and so the warfare of the air has a special attraction to the townsman now.

\* \* \*

In the north-east corner of Trafalgar Square is the old church of St Martin's-in-the-Fields, standing above its fine flight of steps, and presenting to the multitude who pass this busy corner what is supposed to be the best example of a Grecian portico in London. Of that fact they are mostly unaware; they are more interested at evening in the peculiar effect of the red lamp burning in this portico all and every night as a sign that the church is open during the whole period of the war, and is a place for soldiers' rest and contemplation. At one o'clock on a recent Saturday a young officer of the Flying Corps took with him a bride to this church, and there he married her. In that there was nothing remarkable; such a thing had been done before. (And yet a special glamour may seem to fall upon the airman's wedding, the nuptials of the gay rover who scours by night those lofty reaches of the atmosphere.) But, born of their adventure, their special courage, and their chivalry, these airmen have a form of most active camaraderie which is all their own. They who ride the winds seem as fast brothers one to the other of a new race of beings who have left the earth and dart among the birds. The wonder of their ways has worked upon their imaginations, and touched their strong hearts. An enemy is at his human best in this air service; the foes who fly display chivalry towards each other, respecting each other as they must. The best one can recall of the Germans is of their airmen dropping messages into hostile camps telling of the fate of British flyers who were missing, and of their now and then having descended low and let fall a wreath for the grave of some gallant foe for whom they had accounted and who had fallen within his own lines. The fighting in the air seems in some ways as a thing apart from all the ugliness of this war. But on this Saturday afternoon it was marrying and not fighting that the airmen were thinking of, and they were gay accordingly. The groom had a friend with him at the altar for best man; he

had another in the air outside. The best man of the air came up into the high sunlight from the west, with a joyous humming, and on reaching the square he swooped down low and roared the big engines of his new and giant plane in the people's ears. The airman found the church he sought, swam in the air towards it, and high above it circled round and round. A lightness of heart seemed to possess him. He rose and fell, he twirled about, he skimmed and darted; he twisted round imaginary corners that he made for himself, banking up on his side, straightening out again, banking the other way, putting his nose up to sniff the higher air, dropping down towards the roofs once more. This airman was in an unusual mood; he was out for an airman's wedding. Now the pilot appeared really to dance with his machine in air. This big and singing bird twirled more quickly, glided, swung round, and as we watched with necks that forgot their aching, it seemed in the fancy that he was beating time to a waltz of his own that he had improvised from the 'Wedding March' of Mendelssohn. So low he sometimes swooped that he appeared to fan the face of the stone Nelson at the summit of the column, and then, with a one-two-three, he circled above a flagstaff. But it was not enough; the joy of the airman's wedding needed the fullest celebration. Here was this best man of the air just above the middle of Trafalgar Square, when the lips of the people parted a little more, eyes opened still wider, and nerves twitched sharply; for what did they see but this super-eagle standing on end in the air, stretching out its wings to the sky above, and leaping up and up, nose on the top, and then, as if in ecstasy, throwing itself on its back—and over—and falling down, and down, until it seemed to be coming to the earth! . . . And then it was straight again, and with the one-two-three of the imaginary dance it went twirling round the square once more. He had 'looped the loop' over the true centre of London, and lower, perhaps, than it had ever been looped before. As they made responses in the church, he leapt in the air again, and looped the loop a second time, danced in the air and looped again, and a fourth time soared aloft and looped. By this half-an-hour or more had gone, and it was reckoned that the couple were in the vestry with pen and ink for the signing of the deed. So it was done. One gay fling around the square, and then, rejoicing, the husband's friend sailed away over the tops of the buildings, down Piccadilly, over towards the Park, to his nest in the west. Some said it was a pity that the people were not entertained and educated more with such sights. They said it would stir them more. They would be roused to work and pay, they said. Seeing was believing.

\* \* \*

The French, with their imagination and their spiritual fervour, have a fine way of idealising.

They will snatch at a new fancy and construct a glory from it. And their glories work for them. They have made one from the romance of their own air service, which, as they intended, has become a striking feature of their present war history. Materials for a great and throbbing national romance were at their disposal. They accepted them, and have written, nationally and with a semi-official permanence, an epic of the air which at the end of the war will surely stand out and remain for ever as a typical story of France at her greatest, her most intrepid and heroic, in the most cruel war of all. In this fearful struggle there is produced a dense mass of heroism. The utmost limits of courage and nobility of spirit are daily reached in many places, and, as authorities have found, amid so much surpassing glory it is unfair enough to make distinctions. But France desired to find a symbol of herself engaged in the task to which she has laid her heart and soul, and she looked for it among her men darting amid the clouds above her, such men as displayed their utmost Gallic quality in the most romantic circumstances. The aviators of France have done amazing things—perhaps not more splendid than the aviators of Britain; but let that pass. The best among them the Republic characterises as 'aces' according to the number of their aerial successes, and Georges Guynemer was the champion of her 'aces.' In the autumn of last year, when at last he fell from the heights, stricken by a German airman's bullet, he had fifty-three conquests to his own account. That in itself is a wonderful thing; but all the circumstances of this life, which lasted for but two-and-twenty years, are romantic and remarkable, and the high authorities of France were right to seize upon them and urge the attention of the country, and especially its youth, towards them for the stimulus they must afford. It was felt that they would inspire more than ever the love of France, the recognition of duty, the cultivation of discipline, the practice of courage. Here is a pattern of the young man of France, they said in effect; look upon it and copy it. It is the best; it is France. While it was all burning truth, it seemed as if already the truth were legend; the subtle perfume of mysticism appeared to hang about it. The planes he flew with, the gloves he wore, became as almost sacred relics; people gathered solemnly and with immobile countenances in Paris to gaze upon them, and they spoke in low murmurs. Georges Guynemer, the glorious bird who flew away once into the skies and did not come back again, though they waited for him long and hopefully, seemed linked in immortal spiritual kin with Joan of Arc. There are some who do not find it difficult to imagine that at a time not far away the brave Guynemer, who was alive in the air less than a year ago, will be numbered among the saints. On a day that was set apart in

all the schools of France for homage to this hero, the mistress of a small seminary in the little village of Bouclans chose, just by chance, one of her pupils to write, of his own initiative and feeling and skill, a short testimony of the children's appreciation of the subject. The boy thus chosen by hazard was aged only eleven years and ten months, and he wrote the following, which the schoolmistress sent to the hero's parents: 'Guynemer is the Roland of our epoch. Like Roland, he was very valiant; and like Roland, he died for France. But his exploits are not a legend, like those of Roland; they are more splendid when told in simple truth than if they had been invented. For his glorification there is to be written in the Panthéon his own among the other great names. His aeroplane is placed in the Invalides. At our school a day is consecrated to him. This morning, on coming to school, we set his portrait on the walls; as a moral lesson we have learned by heart his last citation in army orders; for a writing-exercise we have traced his name; in conversation we have spoken of him; and, lastly, we have drawn an aeroplane. We have not come to think of him only since he died; in our school every time that he brought down an enemy aeroplane we were proud and happy. But when we heard of his death it was a grief to us, as if one of our own family had gone. Roland was the pattern of the chevaliers of another age. Guynemer becomes the pattern of the French of to-day, and all will try to follow his example, and to remind themselves of him as they did of Roland. I indeed shall never forget him. I shall keep the remembrance that he, like my dear papa, died for France.' So wrote little Franc-Comtois Paul Bailly of Bouclans, eleven years old.

\* \* \*

Think, then, of this model spirit of France. Georges Guynemer was born in Paris on the Christmas Eve of 1894. From his childhood upwards he had the tender affection of his mother and two elder sisters. His father, kindly, but more for stern discipline, was once an officer in the army, and had resigned four years before his son was born. He was devoted to historical studies. Now Guynemer is a very old French name. In the *Chanson de Roland* there is a Guinemer, uncle of Ganelon; and there are others in the old French romances and in the history of the Crusades. Fine traditions hang upon the name. Achille Guynemer, great-grandfather of Georges, went with Junot's army to Spain in 1811, and took part in the famous passage of the Bidassoa; one of his descendants married a young lady of good Scottish family, Miss Lyon. M. Henry Bordeaux, the distinguished French writer, who has devoted himself lovingly to a study of this subject, says that a Guynemer like Georges is the flower of an old French family. It is, he says, like the

case of the plant that bears but a single flower, and even that sometimes only once in a hundred years. All the sap is saved for this flower that has been so long awaited. From the heart of the plant a long stem extends, like a tree whose uniform branches seem as if they were of forged iron. From the end of this stem a wonderful flower comes to bloom; it is humid, and sheds its tears upon the leaves as if to invite them to sorrow for the doom that weighs so heavily upon it. When the flower withers the miracle is not repeated. Such a flower was Georges Guynemer. Some of the stories of his childhood are fine things. The old blood was sparkling in the boy. At school and college, though of but moderate physique, he loved games demanding agility and strength, and was specially addicted to one called *la petite guerre*, in which the class was divided into two armies, each with a general, and officers of various grades. Each soldier wore on his arm a detachable armband, and each army had a flag of its own, which was set up on a wall, a tree, or other suitable place behind it. The object of each army was to capture the flag of the other, and a soldier deprived of his armband was considered dead or out of action. Georges Guynemer always remained a *simple soldat* in these armies, not because he was not clever enough to be a general, but because his agility, quickness of eye, cunning, judgment, and so forth were so valuable in the ranks that he could not be spared from them. It was precisely these qualities that made him such a brilliant success in the air. He was not a good scholar, but he had a lively spirit, was loyal and generous, and possessed a keen sense of honour and a noble pride. The father of one of his friends was manager of a great motor-car factory, so Georges used to visit the works, and began to take a deep interest in motor-engineering. And then, when the aeroplanes began to fly over the country, he was fascinated, and followed every one with his eyes until it had faded away into the distant sky. When the time came for him to leave the Stanislas College and begin the practical work of life, his father asked him what he would like to be, and he answered, 'Aviator.' The parent was surprised, and, regarding aviation as merely a sport, said that it could not be. But the boy answered, saying, 'I have no other passion. One morning, from the quadrangle of Stanislas, I saw an aeroplane flying. I do not know what happened in me; I experienced such a deep emotion, an emotion that was almost religious. You must trust me when I ask you to let me go with the aeroplanes.' The father told the boy that he did not know of what he spoke, since he had only seen aeroplanes from below. 'You are wrong,' said the son. 'I have been up in one at Corbeaulieu.' That was an aerodrome near Compiègne, where they lived. This was only a few months before the war began. In July 1914 the Guynemers were at

Biarritz. Then came the war. Ardour burned in Georges. He asked his father if he might enlist. The answer was that the father wished him to do so. But he was three times turned down for medical reasons. He was disappointed, fretful, and restless. One day an aeroplane came down on the sands of Biarritz, and he talked to the pilot. Then he went back to his father and said he wished to go to the flying-schools of Pau; that before the war his parent had not wished him to take up aviation because it was only a pastime, but in war it was no longer a sport. 'Truly,' said the father, 'in war it is indeed another thing.' Georges went to Pau, and there he pleaded with Captain Bernard-Thierry, commander of the aviation camp. '*Mon capitaine*,' he urged, 'do me this favour. *Mon capitaine*, employ me! Employ me at anything you can think of, even in cleaning the machines there. You are my last chance! Let it be through you that I do something in the war!' The captain thought deeply upon it; he did not like to rebuff such enthusiasm. Then he said, 'I can take you as a pupil mechanic.' That was in November 1914.

\* \* \*

On a day in October three years later a memorial service was held in the little church of Saint-Antoine of Compiègne. Black draperies and the tricolour of France were wrapped about the pillars. The representatives of the Government and the Commander-in-Chief of the army, the heads of aviation and other sections, many brave 'aces,' a father, mother, and two girls, and numerous others sat with bowed heads to listen to the Bishop of Beauvais extolling the memory of a brave son of France. Outside many aeroplanes circled above the church. Comrades of the late Captain Guynemer flew in them; they were part of the famous squadron known as the *cigognes* or storks, to which the hero had quickly become attached after his first experiences at Pau, and in which he had achieved the highest distinction through his intrepidity, his courage, his coolness, extreme skill, and his marvellous instincts and methods in fighting in the air. These *cigognes*, who flew about the old church of Compiègne, seemed to brood in sorrow for the lost pride of their flock. In the middle of the public square of Compiègne there is a statue of Joan of Arc holding up to the heavens the old standard of France, and some said that day that it seemed she was waiting for the return of the hero from the sky to give to him the standard of victory. But, alas! nothing appeared in the sky. The glorious bird did not come back. In the church, again, the bishop read the last citation of Captain Guynemer, the final tribute paid to him in the army orders of the day. 'The general com-

manding the — Army states: Captain Guynemer, commanding Squadron No. 30, died on the field of honour, September 11, 1917. Like a legendary hero fallen in the full heaven of glory after three years of ardent combat, he will remain the purest symbol of the qualities of the race: indomitable tenacity, fierce energy, sublime courage. Animated by the most unshakable faith in victory, he bequeaths to the French soldier an imperishable remembrance which will exalt the spirit of sacrifice and stir to the noblest emulation.' The bishop at the close leaned towards the pew in which the father, the mother, and the two sisters sat, and he spoke of the gentleness, the filial tenderness, of the one who had gone; spoke of the redoubtable eagle which sometimes seemed to change itself to a swallow and fly back to caress with the tips of its wings the house where it was born. The French Parliament took up the tale of glory. Stirring speeches were made in the Chamber of Deputies; letters were read from the superior officers and the comrades of Captain Guynemer, love and admiration burning in the words; and passionately the Chamber passed a resolution, testimony of the Government of France, thus: 'The Chamber invites the Government to place in the Panthéon an inscription with the object of perpetuating the memory of Captain Guynemer, symbol of the aspirations and enthusiasms of the army of the nation.' Then the Senate resolved likewise: 'The Senate, associating itself with the homage rendered by the Government and the Chamber of Deputies, to glorify by an inscription in the Panthéon the memory of Captain Guynemer, hero of the air, salutes in him the spirit of sacrifice, of self-denial, and of energy of all the combatants in the armies of the Republic, who for more than three years have fallen for the country.' Then the Minister of Public Instruction acted. It was ordained that on the morning of November 5 the pupils in the various classes of all the schools of France should be assembled, and there should be read to them the resolution voted by the Chamber, the last citation of the army, the letters from Guynemer's superior officers and his comrades, and parts of the orations made in Parliament; and that a short discourse should be made upon this noble theme, associating with it the names of great Republican generals such as Hoche, Kléber, and Marceau. This was done; in each school it was a wondrous solemn ceremony. At the great Parisian school of Louis-le-Grand the Minister of Public Instruction attended. Since then this flame of pride has burned ever more brilliantly. France has determined that in the appalling whirl and confusion of this war, and after, Guynemer shall not for one day be forgotten.

## THE FORESTER'S GIRL

## CHAPTER XIX.

NOT many moments after the forester was on his way, another early riser, having disposed of his breakfast and deadened the fire with a covering of ashes, took his gun, and calling his dog, sallied forth in quest of some grouse, a covey of which delectable bird they had stirred up on returning to camp on the previous day. Following for a considerable distance the margin of the lake, he came to where on one side lay a waste of treacherous bog-land, above whose black surface rose hundreds of naked, skeleton trees, victims of fire or of inundations from the lake, and on the other a high, flanking amphitheatre of rock, thickly bestrewn with logs, debris of shattered boughs, and huge fragments of boulders, as though some Titan of the Stone Age had been playing quoits. Through this maze, now steeply climbing, now descending, at one moment threading along on dry hummocks between stretches of bottomless ooze, at another bridging them on the boles of fallen trees, the trail from Goose Lake pursued its devious way into a dense thicket of stunted pines, where game of all kinds was wont to shelter.

Thither Gavin Barrie purposed to go so soon as he had glanced about in the more open wood where he had seen the grouse. Another few moments and he would have disappeared in the thicket, before David Hardy, forsaking the usual route for this rougher but shorter one, had reached the fork. As it was, however, Barrie's dog, rushing ahead, nose to the ground, suddenly fetched up short at a point where the trail, before plunging to the edge of the bog, passed between two vast sundered rock-masses. Neither around nor over this obstruction was it possible to advance, and David Hardy, heedlessly scrambling up the steep ascent, suddenly found his progress barred by the motionless apparition of a large, red-brown dog. Astonished, he stared at the animal, which, immediately scenting him, began to bark furiously; while simultaneously the forester recognised the dog, and like a flash his quick mind grasped the connection between the presence of this creature and the end of the tell-tale cigarette reposing in his pocket.

Instantly the smouldering fires of hate flared into fury, and with a savage oath he shouted, 'Get out of here, you d—d cur!'

But the dog, nothing daunted, refused to budge, barking the more fiercely and blocking the trail as he bounced up and down on his fore-paws like a beast at a chain-end.

Hardy picked up a stone, but before he could fling it at his four-footed antagonist there came a shrill whistle, accompanied by the hurried clink of hobnails on the rocks and a voice

calling, 'Hello, "Bob"! Good dog! What have you got there? Treed a bear, have you?' followed by the tall figure and broad shoulders of Gavin Barrie.

'Call your dawg off, or, sure as I'm a livin' man, I'll brain him!' roared Hardy; and Gavin, mistaking the man's pallor and malevolent expression for signs of fear, seized 'Bob' by the collar, and quickly interposed his own body between that of the forester and the infuriated animal, which behind the bars of his master's legs continued to growl and utter short, spasmodic barks.

For an instant the two men confronted each other in silence; then, as Barrie's eye fell upon the stone in Hardy's hand, he said in level tones, tinged with contempt for what he misread as cowardice, 'Drop that stone! The dog won't hurt you. I'll make him keep his distance.'

'And, by God, I'll make *you* keep *your* distance!' hurled back the forester, his fiery temper aggravated to white-heat by the implication of cowardice from this man whom he hated. 'You think I'm feared of your dawg, do you? A pair of curs, both o' you—you and your bellowin' hound—sneakin' round the woods an' up to a decent man's very door like a mangy coyote round a goat-corral! As if 'tweren't enough for you to try to steal my girl behind my back, but you must follow her up now she's my wedded wife!'

During this tirade Gavin Barrie had turned very white, and more than once his fingers tightened on his gun; then he quietly grounded it beside him, and taking out paper and tobacco, began, with great exactitude, to roll a cigarette. Nonchalantly striking a match, he started to throw it away, then carefully extinguished it, saying, 'I was forgetting that the sharp eye of a Government forester is upon me! You *are* a forester, are you not?'

Hardy, rather taken aback by the Englishman's apparent failure to recognise him, sullenly let fall the stone, which, bounding down the rocky incline, was swallowed up in the neighbouring bog—a fact of which Barrie quickly but imperceptibly took note. Then followed a brief pause while the forester's mind worked rapidly. The Englishman's *sang-froid* was something upon which he had not reckoned, and for a moment, even with all the cards in his own hand, as he supposed, he was in doubt how to play them. The smoke-rings, however, which Barrie carelessly blew and idly watched floating away, presently furnished a further opening. Thrusting his hand into his pocket, he pulled out the cigarette-stump, saying truculently, 'Think you can fool me with that sort of bluff, do you? Well,

mebbe, if you don't recognise *me*, you will *this*!' and he thrust forward the crushed fragment.

'Yes, to be sure I do,' replied Barrie in an indolent tone, and lazily inspecting it. 'Sorry I can't offer you something better instead, but that was my last one, more's the pity.'

'I wouldn't smoke one of them stinkin' things if you had a hundredweight of 'em,' snapped Hardy. 'I've got some better use for my time and money, thank God, than to loaf about puffin' out smoke like the engine in a lumber-camp!'

At this retort a flush of anger swept over Gavin Barrie's set face; but, determined not to quarrel with Anita's husband, he controlled himself with a strong effort, and said coldly, 'As you don't seem able to keep a civil tongue in your head, and the morning is too fine to waste, I'll be obliged if you will retreat and let me pass.'

'No! That's just what I don't propose to do!' shouted Hardy. 'You and me has got more than one score to settle, my cock o' the walk, and the sooner the better!'

He took a step forward; but, his foot slipping, there jolted from under his arm the loaf of bread, which all this time his subconscious self had tenaciously gripped. Leaving the paper to flutter limply to the ground, it followed the same road as the stone into the bog, there for a brief moment to shine, a tiny islet of golden crust, before disappearing in the insatiable black mud.

This incident served to recall to the forester's disordered mind the errand upon which he had set out, at the same time affording Barrie a clue as to the reason of his coming that way. Remembering, too, Anita's suggestion that her husband should bring him the bread rather than that he himself should come to the house, he quickly concluded that Hardy must have already known of his camping on Goose Lake, and threatened his wife should she have any intercourse with him. This also would account for the forester's angry attitude as to the finding of the cigarette outside his door, for evidently Anita had not divulged their meeting.

Deeply wounded by the girl's apparent lack of good faith, and his pride hurt to the quick, Gavin then made a fatal blunder by remarking haughtily, 'If you were bringing that bread to me, you need not have troubled, for I fetched my loaf yesterday.'

The forester's face grew livid as he demanded hoarsely, 'Did my wife give you that loaf yesterday?'

'Yes, of course she did,' replied Gavin hotly. 'Do you suppose I sneaked in and stole it from the cupboard? What do you take me for, that you stand there insinuating all sorts of abominable things? Come now; move out of the road or I shall have to drop you over the rocks after the bread, and you mayn't get out again very easily.'

So saying, he picked up his gun and took a

step towards Hardy, the red-brown dog close to heel, while within the forester's breast raged grief at what he now believed to be the proof of Anita's faithlessness, and hatred of the man who, though the seducer of his wife's affections, faced him with such imperturbable assurance.

Blinded by passion, and his reason for the moment nearly unhinged, he made a sudden spring at his opponent, and strove to grapple with him in the narrow gap between the riven boulders. Well for him was it that the Englishman's bulk intervened between him and the dog; otherwise had the white fangs been inevitably buried in his legs.

Yet, even aside from this, Barrie, by reason of his superior height and position, had the advantage. Bracing himself to receive the man's sudden onslaught, he succeeded at the same time in slipping his gun behind him, and then, gripping the forester by the shoulders, began forcing him inch by inch backwards down the trail, slippery with smooth slabs of granite and loose stones.

But it was not without avail that for years past David Hardy's arm had been 'lifted up' against the trees, his whole way of life making for muscle; and when added to this was the powerful incentive of hate, it would probably have fared ill with the older man had not the red-brown dog, now able to squeeze beyond the rocky buttresses, suddenly sprung at the forester with such violence that he lost his footing, struggled vainly to recover himself, and with an oath toppled backwards into the bog below. In falling he struck his head upon one of the innumerable tree-trunks littering the bog, and, thus unconscious and helpless, would probably have speedily sunk into a living grave had not his enemy rushed to his rescue.

Sliding down the face of the rock, he managed, with great caution, to reach and balance himself on a log, and seizing the prone man by the collar, succeeded, at the risk of choking him, in dragging him from the mud-hole to firmer, though quaking, ground. Then, bidding his dog, which had scrambled down after him, to keep guard, he picked his way back to the trail, ran up to fetch his gun, and returned to face, at a few yards' distance, his defeated foe just as he opened his eyes and struggled to rise—an action which his canine custodian resented with low growls. 'All right, "Bob,"' said Gavin. 'You go chase yourself now. I think I can play the rest of the game with a lone hand.' Then to the forester, kindly but austere, 'Are you hurt, Hardy? Your bed was soft enough, but I fancy that old log with which you came in contact was a fairly hard pillow. And you're in a pretty mess, too,' he added grimly, as Hardy, plastered from head to heels with black mud, and with slime from his thick hair trickling down his ashen face, tried to sit up. 'Here, give me your hand;' and David, half-dazed and speechless, suffered his late antagonist to pull him up and prop him

against a rock. Neither had a flask with him, nor was the water fit to drink; but Gavin found a stagnant pool, and soaking his handkerchief, gave it to Hardy, who mechanically wiped his lips and mopped the soil from his face.

Then Barrie, grounding his gun and lightly claspings the muzzle, said, with a suspicion of a twinkle in his gray eyes, 'Well, Hardy, thanks to my dog, I think I've got the better of you, and as it was evidently a case of one or other of us ending his days in a bog-hole, I'm profoundly glad it wasn't I, and almost equally so that it wasn't you!' Then, suddenly changing his tone and flushing hotly, he burst out, 'You've behaved like a blamed fool, David Hardy, and it would have served you jolly well right if that mouth of yours, in which you don't seem able to keep a clean, civil tongue, had been filled with mud enough to choke you. I don't understand even now what all the bluster and fury was about; but I do know just one thing, and that is that that same fiery tongue of yours isn't fit to lick your wife's boots. A brave little woman, facing a lonely life such as hers, and you curse if an old friend so much as looks in at her door.'

'Friend!' snarled the forester. 'Friend *nothin'*! When a woman's married she doesn't need no friend barrin' one, and that's her husband; and I'll not stand to have you or any other fellow hangin' round my home. You *talk* smooth enough; but why didn't she *tell* me you had been there, 'stead of lettin' me come on a fool's errand? I'll teach her to deceive me another time!' he raved on, working himself up again into a fury. 'And as for you—well, the sooner you hike out of these parts, the better for you.'

'At present,' replied Barrie coolly, 'it seems to me, from the position of things, that neither of us is likely to get very far from this particular spot unless you considerably alter your tune.' Then suddenly, with change of voice and manner, he went on forcibly: 'See here, Hardy; why make a fool of yourself and wreck your own happiness and, which is much more important, your wife's? She has done you no shadow of wrong, nor have I; yet now, for the second time, you've tried to murder me, and it's no thanks to you that the knotted end of a rope isn't already waiting for you!'

At this the forester started perceptibly, then tried to rise to his feet; but the quaking moss sank beneath the pressure of his boots, and with a scowl he again reclined against the rock.

'Now,' continued the Englishman, 'according to the rights of the thing, I should be justified in giving you a tap on the head with my gun, tying you up, and leaving you here until I could notify the authorities; and if you attempt to move from where you are I sha'n't hesitate to empty one of these barrels into your leg. But I will give you one chance, and that is that if I let you off and help you out of this

mess, you go straight home, and,' he added sternly and significantly, '*drop this incident of our meeting out of your mind.* You fell into the bog, lost the bread, and never reached the camp on Goose Lake. Do you understand? I shall expect your word of honour upon this; and if you won't give it'—Gavin ran his hand smoothly up and down the barrel of his gun and awaited the discomfited forester's reply.

Still grieved that Anita should have so compromised herself and him by concealing his visit to her home, Gavin nevertheless made a desperate throw to avert a final catastrophe between the man and his wife. Having pretty accurately gauged David Hardy's temperament, he rightly concluded that if he could compel him to curb his violent temper, the crisis would pass and leave him once more rational. In the meantime—so Barrie quickly determined—he himself would soon break camp and return to the Grizzly, and thus avoid any chance of again exposing his little Anita to the jealous fury of her husband; for that the latter truly loved her he hadn't a shadow of doubt.

While the Englishman was thus rapidly thinking, through the forester's mind also raced thoughts—cunning thoughts, so out of keeping with his own straightforward character that Gavin never suspected what lay beneath the words which David Hardy now spoke, sullenly but steadily: 'Well, I reckon you're right, and that it won't help neither Annie nor me if I have to be strung up for a bit of a flare of temper. You ain't got a shadow of right,' he went on rapidly, and with a flash in his dark eyes, 'to dictate to me what I shall or shall not tell my own wife; but I'll give you my word that I won't say nothin' to her about this mornin', provided you'll give me yours that you won't go near my house so long as you're campin' on Goose Lake; otherwise, empty your shooter into me, lock, stock, and barrel, and be damned to you!'

At the closing sentence of the forester's speech a heavy flush dyed Barrie's fair skin, and an angry retort trembled on his lips; but, with a supreme effort to spare Anita at whatever cost to his own pride, he said quietly, 'I give you my word.' Then, giving the forester a hand to extricate himself from his uncertain position and so gain solid ground, he added in a voice wherein contended self-control and outraged feelings, 'Go—for God's sake, *go*—and, if it's a possible thing, purge from your soul as much slime as you do from your shirt! There is abundant need for both!'

With which passionate speech, he wheeled in his tracks, slung his gun across his arm, and disdaining so much as to look whether or not his late opponent took the outward trail, deliberately retraced his steps and struck into the bush, the red-brown dog at his heels.

(Continued on page 353.)

## THE SWALLOW COMES BACK.

THE 'fuller crimson' has come upon the robin's breast, and the lapwing has got the new crest alluded to by the poet. So we welcome back the swallow:

Once in each revolving year,  
Gentle bird! we find thee here.  
When nature wears her summer vest  
Thou com'st to weave thy simple nest.

But so familiar is its yearly coming that we cease to wonder at it. Why should the swallow leave those genial climes where it has passed the winter to brave, it may be, the rigours of an English April? Of course, we have explanations from our scientific advisers, and, equally of course, we accept them. Yet in our heart of hearts we are scarcely satisfied.

A Northern poet gave some of his latest thoughts to the subject, and evolved a beautiful theory. It was Runeberg, one of Sweden's greater bards, to whom the idea came that the summer birds come north in search of light. He could not think that they came to his comparatively bleak and barren land in search of food or climate. Only in one thing was his country richer—the longer day. The summer visitors, then, must come in search of more light. And it is a fact that when the longer days of northern summer set in, then the tide of bird-migration sets northward. When the days shorten again after the autumn equinox, then the birds seek once more the genial south. 'The bird of passage,' said Runeberg, 'is of noble birth; he bears a motto, and his motto is, "*Lux mea dux*" ("Light is my leader").'

There is also a scientific theory which makes 'more light' the great motive of summer migration. It is not, however, the love of light implied in the poet's fancy, but the prosaic fact that the longer daylight gives the birds more time for feeding. The nesting bird requires all the time it can get to feed itself and its voracious young. How in the world does it ever find leisure to sing? One strong point in favour of this theory is that it explains the wonderful regularity of migration. When the appointed time has arrived the birds start on their journey, often in defiance of the weather. If there is an opposing surface wind the migrating hosts will rise, and pursue their course above it. And how often we see them arrive when the country, from the climatic point of view, is not ready for them! But if light be the arousing force, the regularity of the increasing daylight in the north after the spring equinox would be sufficient to account for the birds observing so accurately the times of their coming.

In search of light! Yes, it is a beautiful idea that the aerial pilgrim is drawn north in spring by its love of light. We recall what Mr Baring-Gould has said of the Celtic saints.

They were, he tells us, children of the light, and their love of light led them, in their frail wickerwork coracles, to pursue the summer sun northwards, even to Iceland. So the swallow comes over the rough northern waters to the same land of frost and fire, and the cuckoo ventures within the Arctic Circle. In search of light! Yes, it is a plausible scientific explanation that the migrating bird is seeking more daylight that it may have longer hours of feeding. And yet—well, there is our swallow. Why, on this view, are some content with the comparatively short day of the south of England, while others seek the longer daylight of Scandinavia or Iceland? Why does the nightingale, Ben Jonson's 'Dear good angel of the spring,' stop short in its northern journey at York? And how is it that some willow-warblers find the daylight of North Africa sufficient, while others must needs go to Norway and Sweden? And why do not migratory birds in general seek the midnight sun of the North Cape, or the darkless summer day of the Arctic? What influence, again, can the longer or shorter day have on the great east and west migratory movements? These questions seem to touch the weak points in the light theory of migration. Yet there may be some truth in the poetic views of Runeberg, as well as in the more prosaic suggestions of the scientific explanation. Both seem to clear up certain difficult points which other theories leave untouched.

The swallow is a great wanderer. It is believed to pass the winter in those

Genial bowers  
Of Memphis and the shores of Nile  
Where sunny hours for ever smile,

of which Anacreon speaks. But recent investigations show that it may go much farther. It is not anchored in North Africa for the winter, as it is here in summer by breeding cares. Swallows ringed in this country have been caught in South Africa. 'Thou, O swallow, who hast flown through the whole of the earth and the islands, art bringing up thy young in the picture-frame of a painted Medea.' Surely the old Greek writer had that knowledge of the swallow which has only come to us through the recent capturing of ringed specimens in South Africa.

So the robin ringed here is caught wandering in France in the later year. The bird is a wanderer by nature. The migratory instinct is as essential a property of the bird as its feathers. And this view of the bird as an incorrigible wanderer explains much that is otherwise difficult in migration. It gives a reason for the fact that the swift goes some six weeks before the swallow. The migrants are tied here, and

the wandering instincts held in check, just so long as breeding cares last. The swift is finished with its one brood before the swallow is done with its two. So it departs in early August. The cuckoo, too, goes early, having distributed its eggs amongst suitable foster-parents. The young cuckoos follow much later. And amongst the very earliest to go are those odd birds which have not found mates. The east and west migration of thrushes, larks, starlings, &c., in autumn is likewise explained as a manifestation of the wandering instinct of the bird.

And those extraordinary migratory movements westwards from the west coast of Ireland which have been observed at the lighthouse on the island of Rathlin O'Birne. Immense flocks of

birds moving westwards where the nearest land is North America! No other explanation but the inherent migratory instinct, which *impels* a bird to wander, seems to meet the case. The bird is a wanderer by nature; the migratory instinct is as much a part of bird nature as a horny beak and feathers. An assumption! Yes; but the other view, that the avian race was once non-migratory, and that the migratory habit has got to be evolved, is equally an assumption.

But the swallow comes back. Let us not trouble with theories and explanations, so long as it deigns to honour our barns and chimneys with its nests, and the martin still sticks its 'procreant cradle' in 'every coign of vantage' on our dwellings.

## THE PHILANDERER.

### CHAPTER II.

And little sins—mere flaws of youth—

By years inured, nor early seared,

Are lions in the path, forsooth!

Lads light o' love must dree their weird!

THE months passed, and the years. Having completed the contract which had kept him at Panamá, Duncan McAndrew sold his property there, made over Moctezuma to his son, with other lands in Mexico, and took his wife to Scotland. Thus the Philanderer came to be reckoned amongst the dollar millionaires—Mexican dollars, let it be understood. These were the days of the great coffee boom, when many of the foreign planters in Mexico had their town houses at San Francisco, California, U.S.A., therefore a long journey from their sources of income. Amongst them was the Philanderer, whose wife and children spent the wet seasons at the city on the Golden Gate.

Fortunate in many ways, Phil McAndrew should have been happy; and perhaps he was, for Carmen Lopez had made him a good wife. Aware of his besetting weakness, as will be made clear, she had made light of his lapses, or, at worst, had not permitted them to wreck her life—a hard rôle for a Mexican woman whose instincts are those of her Spanish sisters, but fiercer, owing to the Indian blood in the veins of the great majority. She had given him four children, all girls, of whom he was passionately fond. At the time of the tragedy the eldest was seven.

Until her marriage with Milton Willett, an American coffee-planter, who owned a *finca* in Guatemala, on the Mexican border, and no great distance from Moctezuma, Flora Cameron had stayed on at Panamá with the McAndrews. That her heart had not been broken her marriage may, or may not, have been evidence. That she had neither forgotten nor forgiven was shown by her conduct whenever her cousin visited his people,

for she invariably disappeared. She had met him face to face by accident once since his hasty wedding. On that occasion she had looked through him with stony eyes, ignored his attempted greeting, and passed him by with no more sign of recognition than if he had been a half-naked beach-comber gleaning driftwood on the shore.

His astonishment, therefore, was great when, attended by a *mozo* leading a pack-mule with baggage, she one day rode up to the big house at Moctezuma, dismounted from her tired horse, and asked to see the *padrone*. Being at home, the Philanderer went at once to the *plaza*.

'What! Flo?' he exclaimed. 'This is indeed a surprise! But come in. Wherever have you ridden from?'

'From home—three days,' she answered wearily. 'I have left it for ever. I want advice and help. You are the only relation I have on this side of the world now, and when a woman leaves her husband for good, she can only go to her own people. Where is your wife?'

'San Francisco. But never mind,' he answered in his most *simpatico* tone. 'You look dreadfully tired. You must lie down for a couple of hours. I'll send you some tea. Then, when you have had a bath, you will feel better, and you can tell me all about it.'

A few hours later the runaway wife entered the *salon*. She had bathed, and dressed herself in her prettiest frock, and she looked more charming than ever. Her fair hair, blue eyes, and clear skin were a tremendous contrast to Carmen's dark features and raven tresses; as also was the trim, lissome figure, for the Mexican mother soon loses her shape and her youthful appearance. The Philanderer's pulse beat faster at sight of her, and the first thought that crossed his mind was the usual—in such circumstances—lamentation over spilt milk: 'What a fool I have been!'

Having seated her in the most comfortable chair in the *casa*, he told her that he was ready to hear her story, and advise her to the best of his ability.

'I never loved Milton,' she began, 'but I was as good a wife as I could be. There was another woman—Conchita. I asked him about her, and he struck me. You never would have struck me, Phil. That's all of the story that matters. I have left him for good. How do I stand under Mexican law?'

The Philanderer could not repress a feeling of elation. His pretty cousin, one of his early sweethearts, and the best of them all, had never loved her husband! He was swift to draw a conclusion.

'No,' he said, 'I can't see myself striking a woman—least of all *you*. But I'm not a lawyer. Ordinarily, half the property, real and personal, your husband owns in Mexico belongs to you, and half of your property here to him, if you have any. Neither can sell without the consent in *escritura* of the other, and if there were children the judge of the orphans might have something to say. But there are no children'—the Philanderer knew that—and you have left your husband. The last may be serious. I must consult Vera. He's the best lawyer in Tapachula. I'll send a *mozo* for him. He'll be here to-morrow.'

'Can I stay?' she asked.

'Of course. Where could you go? To an hotel? The Tapachula hotels are not nice places for a lady, and Tapachula is twenty miles from here, anyway.'

'But your wife?'

'I'll send a telegram to her by the *mozo*. She won't mind.'

The runaway wife looked at her one-time lover quizzically. 'She's either very complaisant, or you must have changed a great deal,' she remarked. 'I think you must have changed. I have been sitting in this chair at least a quarter of an hour, and you haven't spoken a word she might not have heard.'

Remarks and tone alike were provocative—perhaps intentionally so, for she was in a bitter mood. The result was as might have been expected. The Philanderer, who had been sitting facing his visitor, moved his chair to her side.

'I haven't changed at all, Flo,' he said, in his most mellifluous tone. 'Not about you. You didn't love Milton Willett. You have said so. I didn't love Carmen. I was a fool. I always was a fool. I loved you better than anybody. We ought to have been married before I came to Moctezuma. I asked you to marry me, and I backed out, like the ass I was. Now I've got to put up with it, I suppose; but I'm as fond of you now as I was then.'

'It's too late, and I ought not to be here,' she rejoined. 'It's much too late for you to talk like that; and if I have run away from my hus-

band, I'm not the sort of woman you seem to think. I must go to-morrow, after I have seen your lawyer.'

He was sitting by her side—he, the Philanderer, not to be deterred by a woman's 'No,' or twenty 'Noes.' She was as good to look at as ever. He slipped an arm round the back of her chair, and let it fall on her shoulders.

'It isn't too late, Flo,' he began, ignoring her movement of annoyance, and paused, as Pablo Lopez, who was acting *administrador* of the *finca*, and had been working in the office close by, entered the room from the veranda in his slippers, therefore almost silently.

'I thought you were alone, Felipe,' he remarked, and stood staring. *El hombre vivo* had not been informed of the arrival of the lady, who was an entire stranger to him. The Philanderer had removed his arm, but not quickly enough.

'I must introduce you, Pablo,' he said, a trifle disconcerted. 'Permit me, Flora? My wife's brother, Don Pablo Lopez—my cousin, Mrs Willett. She has come to see me on business.'

Don Pablo bowed rather frigidly, and presently returned to his work. But that afternoon the *mozo* who acted as mail-boy took to the office in Tapachula two telegrams addressed to the Señora McAndrew in San Francisco. One of them—Pablo's—translated, was as follows:

'Better come home as soon as you can. Felipe has a cousin staying at the *casa*. Another Anita.—PABLO.'

The words 'Another Anita' led to the tragedy, for Anita Morales was exceedingly pretty. The daughter of a neighbouring *finquero*, she had attracted the susceptible Philanderer, who had paid her such attentions as were possible. Doña Carmen knew, and had been greatly troubled; but the girl had married. The mention of her name in Pablo's telegram, however, awoke bitter memories. She telegraphed at once to say she was returning home, and left San Francisco by the next steamer, taking the three youngest children with her—her babies—to be her most powerful advocates in the contest which she feared.

Off the coast of Mexico the boat, s.s. *Colima*, encountered a terrible storm, and sank. There was no survivor—not one!

Phil McAndrew received the awful news by telephone. He was alone. His cousin had left for Mexico City a week before, carrying out her own intention, and acting on the lawyer's advice. Don Pablo was somewhere on the new plantations. At the foot of the veranda staircase saddled horses stood always. The Philanderer sprang into the saddle of the first he came to, and galloped off in a frantic state of mind to find Pablo, who knew that his sister had sailed.

'The *Colima*—the *Colima*!' he shouted, as he caught sight of his brother-in-law in the *monte*. 'She has gone down, and not a soul saved! My God! what shall I do?'

At first Don Pablo was incredulous. But the Philanderer's bitter grief forced conviction upon him. The part he had played in the tragedy struck him like a blow from a quirt. Forgetful of the fact that Don Felipe knew nothing of the telegram he had sent, he stammered out excuses: '*Madre de Dios!* It—is—terrible! But it is as much—your fault—as mine; more your fault—much more.'

'What do you mean, you idiot?' raved the Philanderer. 'How your fault? How mine? I'm crazy, but you're a fool!'

'Perhaps,' rejoined Don Pablo resentfully. 'I telegraphed to her to come home. I saw you with your arm around that woman's neck. I thought my sister ought to be here. Now whose fault is it?'

The Philanderer groaned, and fell from his horse in a faint. The same day he rode down to Tapachula, and telephoned to San Benito, so-called port, but actually open roadstead. A coasting-steamer lay there, waiting for cargo, or, rather, for good weather, so that the cargo could be shipped. That boat he chartered at great cost, and offered a large sum to the *lancha* men to put him aboard of her. At the risk of their lives, they did it. The next three weeks he spent cruising up and down, calling and landing not only at every port, but at every inlet, every *playa*, on that part of the coast, more than half-mad, seeking his wife and children, alive or dead—questioning—questioning, but always disappointed. How could it be otherwise? Where the s.s. *Colima* went down, the Pacific was alive with sharks!

Forced to give up the hopeless quest, he voyaged on the coaster to her home port, San Francisco, and there went to the devil, no matter how.

For years the Philanderer's sleep was broken by horrible dreams. In the middle of the night he would call for his lost babies—for Panchita, youngest of all, born at San Francisco; for Belita; for Mariquita; for Carmencita, his wife. He had paid, and continued to pay. But enough of torture. The Philanderer had paid.

At forty Phil McAndrew was comparatively a poor man. Boom-times in coffee-planting do not last for ever, and his sojourn with the devil had been prolonged and very costly. The old nightmare troubled him occasionally, but as the years had sped the horrid memory had grown more and more faint. Occasionally he visited Moctezuma, but after a few days he would become restless, and leave the *finca* to the care of Don Pablo. His home was at San Francisco. His cousin, Flora, he never saw, never heard of, never thought of if he could avoid it. Otherwise, eleven years after the tragedy, he was much the same Philanderer, handsome, soft-voiced, *simpatico*, impressionable, fascinating, ready to make love to every pretty woman who

crossed his erratic orbit. As he was still thought to be a millionaire planter, and known to be a widower, these were many. Amongst them was Mrs John J. Bunter.

The widow of a patent medicine manufacturer famous in his day for his bold advertising, Mrs John J. was believed to be wealthy. Certainly she was a fine figure of a woman, and of a most 'coming-on' disposition. The Philanderer met her at the Las Palmas Hotel, Los Angeles, where she was staying with a nephew, a diminutive but exceedingly sharp young man, Drake Frogart by name, commonly called Froggie, who was supposed to be connected with the Press.

Mrs John J. was very fond of watching the moon rise from a snug corner seat embowered in palms and magnolias in the hotel garden, and there, one momentous evening, the Philanderer found her, and requested permission to watch the moon rise in her company.

'Why, sure—delighted,' said Mrs John J., and not only made room for him, but shared her cushions. Of course, he made love to her—that goes without saying—and eventually kissed her before taking her in.

Next morning, at breakfast on the veranda, he received a shock. A fellow-guest, who had been his *vis-à-vis* at several previous meals, handed him a copy of the Los Angeles *Star*, with a single word of comment: 'Congratulations!'

'What for?' asked the Philanderer.

The fellow-guest pointed a long, bony finger at a paragraph in the newspaper, and said, 'That, old son.'

The Philanderer read the paragraph, and gasped.

'We have pleasure in announcing that a marriage has been arranged between Mr Phil McAndrew, the well-known millionaire coffee-planter of Moctezuma, Chiapas, Mexico, and of San Francisco, and Mrs John J. Bunter, widow of the late millionaire pill-maker of Chicago, both staying at the "Las Palmas." We wish them happy.'

'*Carrumba!*' exclaimed the Philanderer, greatly agitated; and, newspaper in hand, he left the veranda in search of Mrs John J., whom he found in the breakfast-room.

'Here's a nice josh!' he exclaimed. 'I hope you won't think I'm responsible for this. There'd be trouble if I knew who'd done it.'

'Wal—what is it?' she asked quite coolly.

The Philanderer gave her the newspaper, pointing out the paragraph, which she read slowly to herself.

'Wal?' she questioned, still perfectly cool. 'What about it?'

'It's a great piece of impertinence. It's not true.'

Mrs John J. rose in well-assumed indignation. 'Of course it's true,' she rejoined, with emphasis. 'What sort of a man are you, anyway? Didn't you say I was a real peach, and just the sort of

woman you could be happy with anywhere, even if it was on a desert island? And didn't I say I wasn't stuck on desert islands—Los Angeles was good enough for Mamie Bunter—but I'd try to make you happy, and it would be a real pleasure? And didn't you kiss me to cinch it all up?'

For the third time in his life, so far as is known, the Philanderer was taken aback. 'I—I—don't remember,' he stammered. 'I didn't think I went so far as'—

'Oh, didn't you?' she interrupted; and looking over her shoulder, she called, 'Froggie!'

Instantly the diminutive nephew stood beside her. Where he had come from the astounded Philanderer had no idea.

'Yes, aunt?' he said.

'Where were you when Mr McAndrew and I were in the garden last night?' she demanded.

'In the magnolia behind you, smoking a cigarette,' he replied unblushingly.

'You heard what Mr McAndrew said?'

'Sure! Every word. Couldn't help it.'

'And what I said?'

'Sure!'

'And you told the *Star* man?'

'Sure!'

'There!' exclaimed Mrs John J. triumphantly.

'Now, Phil, what are you going to do about it? You don't want to wriggle. You said I was a peach, and I am—ain't I?'

One feels almost inclined to say, 'Poor fellow!' But, like every other trouble in his philandering career, he had brought it upon himself. Besides, only a wife could keep him in order, and, to use her own expression, the new Mrs McAndrew, relict of the late John J. Bunter, 'sure did.'

Both were disappointed on the millionaire aspect of the union, but there were no recriminations of any consequence. As the lady remarked to her confidant, Froggie, 'There's no sense in pot and kettle quarrels. I wanted a husband, and I've sure got a good looker.'

THE END.

## UNCLAIMED PRIZE-MONEY.

By SIDNEY H. PRESTON.

THE recent distribution of the prize-bounty awarded for the Heligoland battle of August 1914 again draws attention to the remarkable fact that there are very large sums of army and navy prize-money still unclaimed arising from some of our victories of many years ago. An official publication shows that between 1809 and 1876 the unclaimed shares of army prize-money amounted, with accumulations, to £1,890,451. Only £1,122,040 had been claimed, the residue, after setting apart £75,000 to meet anticipated claims, having since been applied towards keeping up Chelsea Hospital and grounds. The interest on the latter sum is still utilised for the same purpose.

Various legacies have from time to time been received by the Chelsea Hospital Commissioners. Some of these bequests are applicable towards providing surtout coats for the in-pensioners and the distribution of small gratuities on the anniversary of the birthday of King Charles II. In addition to the sums already mentioned, prize-money to the extent of £41,144 was erroneously paid to the Exchequer between the years 1841 and 1853, and may possibly yet be repaid to the Commissioners. In this event the total unclaimed balance would be increased to nearly £120,000.

One result of the present great war has been that the lists of soldiers' unclaimed effects, which are periodically published by the War Office, have, unfortunately, been greatly lengthened. A recent issue of the *London Gazette* contained the names of some hundreds of deceased officers and men whose effects, amounting in value to over

£10,000, are awaiting the claims of their next-of-kin or representatives.

The total amount of unclaimed naval prize-money is nearly £300,000. The greater part of this sum has been transferred to the Consolidated Fund, but is available for the payment of any claim which the naval prize cash balance may not be sufficient to meet. There are funds in hand arising from booty captured at Pegu and in China, Indian prize-money, captures for breach of blockade on the Canton River, bounty for the destruction of pirates, and grants for stores captured at Kertch and Yenikale. A parliamentary return was published some years ago which showed the unclaimed shares of all prize-money, slave and pirate bounties, salvage, and other moneys distributed by the Admiralty, but this return dealt only with shares unclaimed between 1855 and 1902. There are records, however, of very valuable prizes taken by us many years previously. For instance, in 1745 the British privateers were very fortunate in cruising against the enemy. Captain Talbot, on a cruise off the Western Islands, fell in with and, after a most obstinate battle, took two large French ships. These were from the South Seas, where they had been for four years, and were immensely rich prizes. The treasure and plate taken out of them filled forty-five wagons. Each sailor's share in this prize-money amounted to £850, while the proprietor's share was £700,000. There is a wide difference, indeed, between the value of shares in naval prize-money in the past and at the present day.

A romantic application made by a claimant some years ago respecting army prize-money ran

as follows: 'Can you give me any information of the prize-money of General —, E.I.C.S.? No claim has ever been made by the heirs, because a marriage certificate could not be found. It was a runaway wedding. The general's heiress married her groom. The will was lost, together with other papers connected with the family.'

No doubt the larger portion of the unclaimed balances of the army and navy prize-money will, for many reasons, never be claimed, and it seems a fitting opportunity to suggest, therefore, that a substantial sum—we would suggest £100,000—should be handed over to the Red Cross Fund.

## THE MONTH: SCIENCE AND ARTS.

### BRITISH-BUILT HOSPITAL-TRAIN FOR U.S. ARMY.

AT first sight it seems rather surprising that the United States should order in this country a hospital-train for her army; but when one considers the saving in transport effected and the previous experience of our railway companies in this direction, strong reasons are apparent for such a course. The train referred to has been built by the Lancashire and Yorkshire Railway Company, which had already constructed five similar trains. Sixteen bogie carriages form the train, which has a length of nearly one thousand feet, and weighs four hundred and forty-two tons. Three tiers of cots on each side of the ward carriages provide accommodation for four hundred and eighteen cases, but the cots of the middle tier are so hinged that they may be lowered to form backs for the cots of the bottom tier when these are used as seats. In this way a larger number of men can be accommodated when some can sit up. The accommodation includes a kitchen-car, sitting and dining rooms for sick officers, a pharmacy and a bathroom; while the water-supply system has a capacity of over three thousand gallons. Some interesting illustrations of this hospital-train are given in *The Engineer*.

### ELECTRIC WELDING FOR DAMAGED GERMAN SHIPS.

Most people are familiar with the simple operation of welding one piece of iron with another as performed by the village blacksmith, but it is not so generally known that broken articles of steel or iron can be welded together again by electricity. When this operation is carried out, one wire from a powerful dynamo is connected to the damaged article, while the other wire terminates in a carbon rod which is applied to the joint, and creates a white-heat at the point of contact. Special alloy steel wire is used for welding by this process, and is applied to the joints almost like a cement. Iron castings joined up in this way are actually stronger at the welds than elsewhere, and the work can be carried out very quickly. This process was utilised for repairing the machinery of the German and Austrian vessels in American ports which were taken over by the United States when war was declared, the crews of these ships having done all the damage they could to the

machinery when war was seen to be inevitable. Electric welding has enabled quick repairs to be effected, and fifteen vessels have been thus treated and put into service.

### NEW METHOD OF MAKING CAST-IRON PIPES.

Every one must have seen cast-iron pipes in use as rain-water pipes on houses, as gas and water mains under the streets of our towns, and for other purposes. Hitherto such pipes have been cast in the ordinary sand moulds used for other types of castings, the moulds being split in half lengthways, so that they can be taken apart for the extraction of the pipes when the metal has cooled. Naturally a core has to be arranged down the middle of the pipe, and much difficulty has always been experienced in getting this exactly in the centre. Again, where the joint comes, metal is apt to run into the crack and leave fins on the pipe, which have to be cut off afterwards. To avoid these drawbacks attempts have been made during the last fifty years to cast pipes in revolving moulds, in which the liquid metal is thrown round the surface of the mould by centrifugal force. Such moulds need not be split in half, as the pipes can be withdrawn from the ends, while the outsides of the castings are left perfectly smooth and require no subsequent treatment. Until comparatively recently none of the attempts has been successful, but pipes are now being cast in revolving moulds in Brazil, where a machine has been at work for the last three years. We understand that Mr D. S. de Lavaud is responsible for the success of this undertaking, but it was only after many difficulties had been overcome that satisfactory cast-iron pipes were produced by this method. Exhaustive experiments were carried out to ascertain whether the moulds should be heated, and, if so, to what degree of temperature. It was found, however, that the best results were obtained in cold moulds; consequently the moulds are water-jacketed. Those familiar with iron-founding would naturally suppose that a cold mould would produce a hard and brittle pipe. This, however, is not the case, the pipes coming out soft and comparatively tough. The thickness of the castings produced in this way is perfectly even all over, and pipes as thin as one-eighth of an inch can be successfully produced. Moreover,

much less time is occupied in casting pipes by this method than by the old plan, ten an hour being turned out by the machine referred to. It is claimed for this process that it produces pipes 30 per cent. stronger than those produced by the ordinary method, that the weight is reduced by 40 per cent., and that the metal is far less liable to corrode. The business has now been removed to Toronto, and when certain minor difficulties have been overcome plant will be laid down for working on a large scale.

#### PALATABLE BREAD FROM WAR-FLLOUR.

An interesting investigation into the reasons for the sourness and other unpleasant qualities of war-bread has been carried out lately in France by Professors Lapicque and Legendre. It was found that these defects became pronounced when more than 80 per cent. of the wheat was turned into flour, and, according to the first-named professor's report, they are caused by the layer of aleurone surrounding the germ. The function of this substance is to fertilise the germ by fermenting the white inner portion of the grain which formed the white pre-war flour, the process being set up by the presence of moisture. When left in the flour, as is the case if 85 per cent. of the grain is utilised, the aleurone ferments in the bread, and gives rise to a sour taste and smell, and causes indigestion in many people. Further investigation showed that when the 'middlings' containing the aleurone were exposed to an alkali—for example, the vapour of ammonia—they changed in colour to a lemon-yellow, which indicated the elimination of the liability to fermentation in the bread. Subsequently this discovery was applied in a military bakery by treating the 'middlings' separately with lime-water (another alkali) until the change of colour was produced, after which they were used with the other part of the flour for making bread. The results were entirely satisfactory, the bread being sweet both as regards taste and smell, even after being kept for several days, while it was lighter in colour than the ordinary war-bread. Eventually it was found that equally good results could be obtained without treating the 'middlings' separately, by mixing the flour with lime-water instead of plain water. The amount of lime is too small to form a danger to health, being only one part to three thousand parts of bread.

#### GERMAN SHORTAGE OF IRON ORE.

Before the dawn of civilisation fighting between savage races was mostly caused by lack of food. As a tribe increased, the district in which it was located ultimately became too small to yield the necessary supplies of animal and vegetable foods for supporting the population. In such circumstances either a migration to a richer area was effected or the borders of the tribal domain were enlarged. If other tribes

already in possession of the coveted land resisted, fighting ensued, and the stronger party turned out the weaker or killed them off. According to some authorities, all wars, even up to the present time, have arisen, directly or indirectly, from similar causes; but civilisation has introduced other commodities worth fighting for, and lack of food no longer forms the only source of dissension between nations. The possession of iron, for instance, is now a vital factor in the progress of every powerful country, and, according to a recent article in a contemporary, a shortage of this metal for maintaining the increasing iron and steel industry in Germany exercised no inconsiderable influence in bringing about the present war. Support for this view is found in a memorandum to the German Chancellor in 1915 by a number of leading industrial societies, in which one of their requirements, as a condition of peace, was the retention by Germany of the rich iron-producing region of Briey. Even stronger evidence of Hunnish rapacity is afforded by a quotation from a Leipzig paper, published last October, in which the suggestion is made that if Germany keeps the iron-mines of France and Lorraine she will be able to produce fifty million tons of iron ore per annum, which would give her a preponderating share in the production of this commodity in Europe, and assure continuous work and prosperity for the German working-classes. That a shortage of iron ore made itself felt in Germany before the war is apparent from the purchase of the Soumont iron-mine in Normandy by a well-known Prussian ironmaster, with the intention of establishing smelting-works and shipping the iron to Germany. Moreover, the originator of this undertaking, which was on a large scale, pushed it forward in the face of very considerable difficulties, and some two million pounds had been spent on it when the war began and the concern was taken over by the French. Incidentally the German scheme has been vastly extended by French engineers, and this source of iron is already proving of great value to our Ally.

#### SALVING A GERMAN 'TANKER.'

When the war comes to an end hundreds of fine ships will be lying at the bottom of the sea, many in such positions as to render the raising of them a practicable proposition. Salvage operations are, therefore, of particular interest at the present time, as showing what can be done by perseverance and ingenuity. A difficult task of this nature was recently carried out on the Mississippi, near the town of Baton Rouge, where the German tanker *Gut Heil*, sunk by collision in 1912, was successfully raised. Some time after the accident her underwriters, the Standard Oil Company, tried to raise her, says the *Scientific American*, but this attempt was a failure, and nothing further was done until a few months ago, when a New York salvage

concern undertook the difficult task of refloating the vessel. The undertaking was rendered particularly risky by the fact that the ship was lying on her side with her deck towards the shore, while during the four years she had been under water large quantities of mud, estimated at four thousand tons, had found their way into the hull. This mud was first removed by a powerful compressed-air siphon; then the hull as a whole, as well as each compartment, had to be made water-tight. Ferro-concrete was used for this purpose, the work being carried out under water by divers. The intention was to blow compressed air into each compartment, and thus expel the water through suitable outlets at the bottom—a plan now often followed for the salvage of large ships. It was very important that the water should be evenly expelled from all the compartments; hence, in addition to the air-hose and water-outlet connections, small pipes were run to a series of gauges which showed the water-pressure, and therefore the water-level, in each. These gauges and the compressed-air valves were all mounted together on a control platform, the operator being thus able to see exactly what was happening, and to vary the air-supplies as required. Arrangements were also made to turn the vessel right way up as the water was blown out. This was accomplished by a big wire-rope attached to the deck, passed round the vessel, and made fast to a powerful winch on shore. Checking-ropes were also attached to the deck and led direct to other winches, their function being to prevent the vessel from righting herself too suddenly. The above preparations, which occupied two months, led to a complete success, and the *Gut Heil* was refloated in a day. When sunk, this German ship was valued at about sixty thousand pounds; such a vessel is now worth more than three times that sum. Iron and steel do not corrode nearly so fast when completely immersed as when half in and half out of the water, and the *Gut Heil* is said to be structurally sound, while her machinery can easily be put into order again.

#### FUTURE SOURCES OF PAPER.

Further drastic restrictions on the import of paper came into force on the 1st of March, and it is instructive to consider how dependent this country has become upon other countries for the raw materials used in the manufacture of paper. A lecture dealing with this subject was recently given at the London School of Economics by Mr R. W. Sindall, a specialist in paper technology. According to the lecturer, the possibility of a shortage of wood-pulp (from which paper for newspapers is mostly made) became apparent thirteen or fourteen years ago, but no serious consideration was given to the position by the trade as a whole, although one or two individual firms took steps to ensure their own future supplies. In 1914 over eight hundred thousand

tons of paper were prepared from imported materials, whereas in 1917 the output was only three hundred and twenty thousand tons. The chief producing countries are the United States, Canada, Norway, and Germany. Some idea of the magnitude of the problem may be gathered from the figures stated by Mr Sindall of the number of trees consumed in the manufacture of wood-pulp necessary to meet the world's demand in normal times. The consumption was given at from fifty to sixty millions per annum. Perhaps a more startling way of presenting the case was the further statement that from one hundred and fifty to three hundred trees were required to produce the pulp used for one issue of a certain daily paper. Very little can be done during the war to improve the situation, but for the future bamboo was stated by the lecturer to constitute the most promising source of pulp in the British Empire. Nothing was said to encourage the belief that this country can ever become self-supporting as regards the production of paper-making materials.

#### RUNNING CAR-MOTORS IN CLOSED GARAGES.

When a car is laid by, as is now the case with many, some owners run the motor occasionally to make sure that everything is in order, and ready for the road, should the car be required unexpectedly. Garages are often heated and used for purposes other than the housing of the car, or some part of the car may be overhauled, the work being done much more comfortably in a warm garage. Under these conditions there is a strong temptation to run the motor with the garage closed up; but this practice, according to the *Scientific American*, is a dangerous one, as the gases given forth by the exhaust mainly consist of carbon-monoxide, which is of a deadly poisonous nature. Moreover, this gas has no smell, and a very small percentage of it is fatal, while the symptoms before collapse are easily attributed to other causes. Sometimes a ringing in the ears and a slight giddiness are noted; but even if a person affected goes out into the fresh air at once, he or she may become unconscious, with disastrous results, unless help is speedily forthcoming.

#### HEAT AS A PALLIATIVE MEASURE IN CASES OF SHOCK.

During severe winter weather at the front many wounded men are inevitably frozen stiff with cold ere they can be brought to a dressing-station and receive the kindly attention of a surgeon. Before anything can be done for them they have to be 'thawed out.' This is effected by means of oil-stoves placed under their temporary couches, only the head being left uncovered by blankets. In the less exposed stations hot pipes are installed for the purpose. The poor chilled soldier is 'baked,' as it were, to a certain temperature, and is soon comparatively comfort-

able and fit for surgical examination and treatment. This warming arrangement not only counteracts the effects of exposure in 'No Man's Land' and during the stretcher-bearers' arduous journey over miles, perhaps, of precarious duck-boards; quite accidentally it has been found that men thus 'thawed' suffer much less afterwards from shock than those who have not undergone the 'baking' operation. Accordingly the advent of milder weather will not give a respite to the oil-stoves and the hot pipes, which may yet come to play a regular part in the curative treatment of men suffering from shock.

#### AN EXPANDING BAND FOR WRIST-WATCHES.

As was noted in our issue of June last, the wrist-watch has, by a natural process of evolution, developed into a thoroughly serviceable article, popular alike in naval, military, and civilian circles. A corresponding development has taken place in the band by which the watch is held in position. The leather strap originally used was worn through in a comparatively short time, and it had the disadvantage of staining the wrists, especially in wet weather. The expanding metal band, which was next tried, was soon found to be unreliable, for the uneven pressure to which it was constantly subjected caused it to yield unduly at the point where the strain fell, thus completely destroying the elasticity of the band, and terminating its career of usefulness. A band made up of a number of expanding links, on the same principle as a lady's expanding bracelet, promised better results; but through its catching in the hairs usually found on the back of a man's wrist, it was a constant source of irritation and sometimes of considerable pain. A device which has recently been put on the market appears to avoid all these disadvantages. It contains only two expanding links (which are placed end to end, and come in contact with the wrist only on the inner side), with a section of curb chain, ending in a clip or hook, on each side of them. The new band is easily put on or taken off, and while always keeping the same position under normal circumstances, may be pushed up the arm to allow of the hands being washed. The springs, being of gold, are not affected by water, and permit of the band being oxidised, if that is preferred to the more usual silver pattern.

#### COMPULSORY SEED-TESTING.

The necessity for the maximum production of food within our own borders has led to a step being taken which has long been advocated by the best-informed agricultural opinion. With regard to the seeds which they purchased, English and Welsh farmers have hitherto been largely in the hands of seedsmen, and some serious failures of crops which took place last year were clearly traced to the unwitting use of old, incorrectly described, or otherwise unsuit-

able seed. By the Testing of Seeds Order, the seller, before offering seeds for sale, must have them thoroughly tested, and at or before the time of sale must disclose to the buyer all the essential facts, including the percentage of purity, and the nature and quantity of certain dangerous impurities (if any), revealed by the test. To help both buyer and seller the Board of Agriculture and Fisheries has just opened an official seed-testing station, where samples of seeds will be scientifically tested on payment of a very small fee. It is interesting to note that in this matter England has lagged behind not only Continental countries, but Ireland, Scotland, and the daughter-lands of Britain as well. Seed-testing stations have been in existence on the Continent for over forty years; Dominion farmers have long obtained the best expert advice for the asking; Ireland has had its compulsory testing and its station for sixteen years; six years ago Scotland established a voluntary testing-station, which has now become the official centre. It is certain that the application of compulsory seed-testing to every part of the United Kingdom, and the helpful working of official centres in London, Edinburgh, and Dublin, will confer a great benefit upon all tillers of the soil, and will in the near future prove of inestimable value to agriculture.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

#### THE GOAL.

THE tiny streamlet in its wandering glee,  
Bank-bound, flows on with others of its kind;  
The whispering waters hear upon the wind  
A voice that cries, 'O children, seek the sea.'  
Deep unknown mystery—impelling goal—  
That all in unison must reach at last;  
Streams grow to rivers, till the waters vast  
Within one mother sea find the one soul.

Thus in each heart is love—a little stream  
That needs must seek another to flow on,  
To swell the flood of love—for not alone  
We reach that mystery of which we dream.  
Love the beginning—love the final goal—  
And every soul a part of one vast soul.

FRANCIS ANNESLEY.

#### \* \* TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL.*
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

## SEVENTH SERIES

### PETER DAUNT'S FIRST BRIEF.

By B. PAUL NEUMAN.

#### CHAPTER I.

PETER DAUNT was a tall, lean, shock-headed boy in the top class of a Council school near Chancery Lane. He was not very popular with the other boys, for he was no good at games. To the head-master he was a great disappointment. It was very rarely that a scholarship came to Rotchet Row. Here was a boy who could hardly help winning one, and his father and mother refused to let him try. In vain did the exasperated master set forth the dazzling possibilities of the famous ladder.

Mrs Daunt only shook her head, and repeated at intervals, like a refrain, 'Me and 'is father don't 'old with scholarships.'

Their utmost concession was that, instead of escaping by the Labour Certificate, Peter should stay on till he was fourteen.

'It's a wicked shame,' said Mr Gibb to the boy's class-master. 'He's the cleverest boy in the school.'

'Oh yes,' answered Mr Pilling. 'There's no doubt about that. The best we've had in my time.'

A day or two before Peter's fourteenth birthday Mr Gibb received a very vilely written note asking if he could recommend one of his scholars as office-boy in a barrister's chambers, 'beginning at seven shillings a week, with a steady rise if he proves satisfactory.' The body of the letter was bad enough, but the signature was hopeless. Mr Gibb inclined to 'Welling,' Mr Pilling favoured 'Lattery,' while a third consultant voted for 'Cutting.'

Finally, Mr Gibb wrote a commendatory note, and told Peter to take it in person. 'The barristers' names will probably be written up on a board,' he said, 'and you must judge which is nearest to the signature in the letter.'

Luckily, the address was printed on the note-paper. 'Agar Chambers, Southampton Buildings, Chancery Lane,' suggested to Peter a large, handsome, modern edifice. Instead, he found an old, dirty, ramshackle, two-storey house, the ground-floor front occupied by a firm of estate agents. Under the stairs that led to the upper floors ran a long, ill-lighted passage with a door

at the end of it. At the entrance of this dismal house was painted a table of contents:

*Ground Floor.*—Messrs Mander & Skill.

Mr Lilly.

*First Floor.*—Messrs Aydon & Francis, Commissioners.

*Second Floor.*—Mr Hopely.

Rejecting both the firms, Peter chose Mr Lilly as being the nearer of the other two. Accordingly he walked along the passage, and gave a hesitating knock at the door. There was no answer. After waiting a minute or two, he tried again.

This time the knock had hardly sounded when the door was jerked open, and a big, loose-made man with a large pasty face and dark angry eyes appeared. He spoke in a loud, rasping voice. 'Who are you, and what do you want?'

Disconcerted by this rough reception, Peter took out the note he had brought, and offered his credentials. 'Please, sir,' he said, 'I think this is meant for you.'

'Then why the devil isn't it addressed to me?' demanded the big man; but he opened the letter and glanced at its contents. 'Oh,' he said, 'you're the boy, are you?'

'Yes, sir,' Peter answered. 'Mr Gibb wasn't sure about your name.'

'Teaches writing, and can't read it, eh? Do you know my name?'

'I think you're Mr Lilly, sir.'

The big man turned on his heel. 'Shut the door,' he said, 'and come in here.'

Peter did as he was bidden, and followed his leader through a small room, bare and dirty, into a larger room, dirty too, he thought, but, if anything, overcrowded with furniture, and lined with well-filled bookshelves. A fire burned brightly in the old-fashioned grate, the air was heavy with the reek of tobacco, and Peter's quick eye caught sight of a big black bottle and a tumbler standing on the mantelpiece.

Mr Lilly pointed to the arm-chair at the table. 'Sit down there,' he commanded. 'Take that pen, and write what I read out to you. There's some paper.'

Hardly waiting for the boy to get ready, he opened a book and read three or four lines of what sounded to Peter unintelligible gibberish, beginning with, 'To have and to hold.'

Half-way through, the boy stopped, and held up his hand. 'Please, sir, I lost something there. Would you please read it again?' he asked.

'No, I won't. Put down what you haven't lost.'

When Peter had finished, Mr Lilly took the paper and glanced at it. Then he crumpled it up and threw it into the fire. 'You'll never make a lawyer,' he said. 'Any fool could read those pot-hooks. Now then—where's Nova Zembla? What's thirteen times thirteen? And whereabouts is your liver?'

From force of habit, Peter stood up. 'In the Arctic Ocean,' he answered. 'One hundred and sixty-nine. My liver's somewhere here;' and he stroked the middle of his waistcoat.

'To-day's Thursday,' said Mr Lilly, his voice not quite so rough as at first. 'Can you come on Monday?'

'Yes, sir.'

'Nine o'clock sharp. Nine till I've done with you. Seven shillings a week to start with. Here's the Queen's shilling.' He tossed a shilling on to the table. 'Now, take yourself off.'

This was how Peter Daunt joined the Devil's Own.

#### CHAPTER II.

PETER soon found that he had enlisted in a very strange service. Before he had been in Agar Chambers a week, he knew that the black bottle was a very important article of furniture. When it disappeared, there was work of some kind in view, and Mr Lilly smartened himself up and became quite brisk and business-like. When it came back, he sat in his chair, alternately dozing and glowering, a short, heavy pipe between his lips, half the buttons of his waistcoat open, his necktie all awry, and his language, when he was disturbed, sulphurous in the extreme. The work was chiefly coaching. On two or three days in the week several young men came to be squeezed through their legal examinations, and one of the boy's duties was to write out and put on Mr Lilly's table, the first thing in the morning, a list of such appointments, and, at the end of the day, to enter them in a diary. Occasionally—very occasionally—a solicitor's clerk would leave a set of papers, and sometimes make an appointment for his principal to call. More often, a boy from Mr Lagsdale's chambers in Stone Buildings would come round with papers to be 'devilled,' which, in due course, Peter had to take back. Another of his duties was to cut the *Reports* and *Weekly Notes* as they came in, and see that they were kept in order of issue. The books had overflowed into his room, and,

being of an orderly disposition, he had cleaned, and sorted, and arranged them according to size.

Besides being orderly, he was remarkably quick, and in consequence found the time often hang heavy on his hands. He had joined an evening-school, and practised shorthand diligently; but sometimes he turned to what he called 'his' books for companionship. Most of them were quite beyond him—Latin and Greek, and some old volumes of conveyancing forms; but among them he found two odd volumes of the *Lives of the Chancellors*, and one of the *Lives of the Chief-Justices*. These he read over and over again, till he knew them almost by heart; and law, which at first had seemed to him unutterably dry and repulsive, began to wear quite a romantic aspect.

From his master he received no encouragement. Indeed, Mr Lilly treated him with an almost inhuman detachment, as if he were just a piece of office furniture, until he really welcomed the occasional outbursts of oaths with which on 'bottle days' the barrister greeted everything he said or did. Yet it was not long before the boy began to make himself useful. When he had been in Agar Chambers about six months, Mr Lilly cut his right hand rather badly with a broken glass.

He called Peter into his room. 'I shall have to use your pot-hooks, after all,' he said, and began to dictate some questions for one of his pupils. A very rapid worker, he soon grew impatient.

'You're infernally slow, Daunt,' he exclaimed. 'I'll try to do it myself with my left hand.'

'Please, sir,' asked Peter, 'may I try to take it down in shorthand, and then transcribe it?'

'Of course you can, you young idiot. Why on earth didn't you say you could do it?'

'I haven't got much speed,' Peter answered modestly.

The experiment, however, proved so successful that henceforth few days passed without Peter being called in to take down.

Among the pupils was a young articled clerk named Rowe, who was preparing for his intermediate. His father, a solicitor in the City, was one of Lilly's few regular clients, and occasionally brought him a heavy brief. The son was a lively, pleasant young fellow, who seemed to have taken a fancy to Peter, and often stopped for a few words with him after the lesson was over. One day he left one of his law-books behind him, and on his next visit he found the boy poring over it.

'Hallo!' he exclaimed; 'are you going to be a judge?'

Peter blushed, for the *Lives of the Chancellors* had indeed stirred his ambition.

'I was just looking out the answers to some questions I took down yesterday,' he answered.

'That's the very job I shall be tackling to-morrow,' said Rowe.

This was in the summer, and a week or two

later the young man came in at lunch-time when Lilly was out.

'Look here,' he said. 'I'm taking my holiday next week, and I shall be away for three weeks at least. You seemed very keen on this book. Shall I leave it with you till I come back?'

Peter's face lit with pleasure. 'Oh, will you?' he exclaimed. 'I *should* like to try it. It seemed to make law quite easy.'

'No,' declared Rowe; 'that's more than your boss can do, and he's about as clever as they make them. He was senior classic at Cambridge, though he doesn't look like it now.'

'What's senior classic?'

'The best of his year in Latin and Greek. He's looked upon as a very big pot. Lots of the judges haven't been in the first half-dozen.'

Peter's eyes opened wide. 'Will he be a judge?' he asked.

Rowe shook his head. 'If he could have kept his lips dry, he might have been,' he answered.

### CHAPTER III.

WHEN Rowe came back from his holidays Peter returned the book—it was an elementary work on contracts—with fervent thanks. Rowe smiled—a somewhat incredulous smile.

'So you enjoyed it?' he asked.

'Yes, I did indeed,' Peter replied.

'Did you understand it all?'

'No. I've put down some of the things I couldn't quite get hold of.' And he took from under his writing-slope a piece of paper covered with notes.

'Your boy out there is a bit of a wonder,' said the young man to Lilly a few days later.

'Is he?' asked the barrister carelessly. 'What's he been up to now?'

'He's been reading that book of Fletcher's,' replied Rowe, 'and he knows it from cover to cover.'

Lilly was not sympathetic. 'Little fool!' he commented. 'What's the good of that to him? If he'd get out of his disgusting pot-hooks it'd be more to the purpose.'

But from that time Peter's legal education made steady and rapid progress. Thoroughly interested, Rowe lent him book after book, and, so far as he could, helped him to solve the difficulties they contained. And every six months Peter's wages rose a shilling a week, and he added a good fraction of a cubit to his height.

(Continued on page 375.)

## THE AGE OF INSECTS.

By C. A. EALAND, M.A., Author of *Insects and Man*, *Insect Enemies*, &c.

AT a certain period during the infancy of the world strange monsters peopled its surface, gigantic long-necked creatures disported themselves in its waters, and uncanny flying beasts filled the air; it was the Age of Reptiles. They possessed the earth, and it was their world for the time being. Other times brought other Ages, till to-day we appear to have arrived at the Age of Insects. The statement may be received with incredulity by those who have given it but a passing thought, yet the fact remains that insects are, directly and indirectly, doing more harm to man and his belongings than any other single agency since the birth of the world.

From the earliest recorded times insects have been mentioned in uncomplimentary terms. They were implicated in the plagues of Egypt; they have devastated the face of the earth ever since. Of the half-dozen most deadly diseases to which man is heir, four at least are transmitted from man to man solely by the agency of insects. More loss is caused to the farmer, the stock-breeder, and the market-gardener by insects than by any other means. Vast engineering projects—the early efforts to construct the Panamá Canal, to wit—have been abandoned on account of these six-legged enemies of man; other schemes of lesser importance have only

matured at the cost of thousands of human lives because ticks, which are closely allied to insects, transmitted disease far and wide. A South American suspension-bridge is actually known as Verruga Bridge, on account of the toll that verruga-fever, a tick-transmitted disease, took of the lives of the workmen engaged in its construction.

Apart from disease, heavy financial loss is caused annually by insects. We must turn to the United States for figures. The Americans estimate that the actual money loss occasioned by insects in their country during a year amounts to no less than two hundred and fifty million pounds. One-fifth of the American fruit-crop is destroyed annually; and, by one species of insect alone, the rich vineyards of France were threatened with total destruction. Add to this story the fact that a man's activities may be reduced as much as 75 per cent. for a number of years by such a disease as malaria, and it is clear that the insect question is not one to be lightly shelved.

There are rather more than five hundred thousand different kinds of animals on the earth at the present day, and of these at least three hundred and fifty thousand are insects. As a class they far outnumber any other class in the animal kingdom. Individually they are more

numerous than all the rest of the animals combined—a fact that is liable to be disregarded; it is mainly on account of their numbers that they are so dangerous. Their attacks on man and his property are, for the most part, so insidious that they may be overlooked for a considerable time or escape observation altogether.

The summary of insect devastation makes a doleful reading. In this country we are often subjected to considerable annoyance by the bites of gnats. Well, a gnat is a mosquito; they are one and the same thing; and mosquitoes are certainly the worst enemies of mankind the world over; though, so far as we know, the British species do not transmit any disease. It is always wise to add a proviso when writing of blood-sucking insects, for the harmless insect of to-day may, by the light of later research, prove eventually to be a serious menace to health.

Malaria is passed from patient to patient by a mosquito. Not so very long ago this disease was thought to originate in damp places; in fact, the very word 'malaria' is derived from the Italian *mal aria*, 'bad air.' The connection between the disease and moisture is certainly very close, but not of the nature that the early medical men surmised. Moisture is favourable to the breeding of malaria mosquitoes, but in itself has no connection with the disease.

How the first malaria patients came into being is a matter of conjecture, but once they are established in a district frequented by the mosquito essential to the transmission of the disease, its rapid spread is assured. This brings us face to face with a fact that has been proved beyond a doubt; the disease can only be carried by mosquitoes of the genus *Anopheles* or some closely related genus. If a malaria subject be bitten by a mosquito of the genus *Theobaldia*, for instance, which in turn sucks the blood of a healthy man, he will suffer no inconvenience beyond the temporary irritation common to such attacks. Supposing, on the other hand, an *Anopheles* imbibes malarial blood and later passes to a healthy person, that person becomes infected with malaria, and thus the disease is spread. Each insect can infect three or four individuals. With the infected blood the mosquito takes up a very large number of minute organisms; these develop in the insect's stomach, then break loose into its body-cavity, and eventually find their way to its salivary glands. As a result, at the end of twelve days or so—the time taken by the parasites to develop within the mosquito and pass to its salivary glands—the next human skin to be punctured by the needle-like sucker of the insect is destined to serve as a mantle for a malaria victim. It all sounds very simple, and perhaps not very alarming, but nearly one-half of the sickness in the tropics is the immediate result of malaria, a

disease which is disseminated by mosquitoes, and by mosquitoes alone.

Another mosquito—which, by the way, is partial to pools in the vicinity of human dwellings—is the sole agent for the transmission of the dreaded yellow-fever. This disease, less than twenty years ago, was thought to be highly contagious and infectious; however, many people who had never been near a fever patient contracted yellow-jack, as it is called. This set the medical men thinking, with the result that the guilt was laid upon mosquitoes of the genus *Stegomyia*. The story of the transmission of the infective germs by the insect differs but little from that of the similarly transmitted organisms of malaria. The human host is only a source of infection to the mosquito during the first four days of his illness. If he is bitten during that time the disease will be spread. For a fortnight after her drink of yellow-fever blood—the females alone suck blood—the germs of disease incubate within the mosquito. Thereafter, for the whole of her existence, she will infect by her bite any other human being whom she may favour with her attentions. It was these two mosquitoes, *Stegomyia* and *Anopheles*, that held up the construction of the Panamá Canal, till the United States Government took the matter in hand and dealt so severely with the insects that the Panamá district, from being a veritable death-trap, has been converted into one of the most healthy areas in the tropics.

For some unaccountable reason certain diseases, above all others, appear to grip the public imagination. Sleeping-sickness is one of the number. We are confronted from time to time with vast problems in the government of our African colonies, and not the least of them is the control of sleeping-sickness, which has spread rapidly over a large part of the continent and claimed literally hundreds of thousands of lives. No disease has created more interest or been the subject of more careful study; no ailment holds a more tragic fate for its victims. Two kinds of fly, closely resembling our house-fly, are responsible for the spread of this disease. They go by the name of *Glossina*, and are peculiar in that they never lay eggs, after the manner of the house-fly, but bring forth fully developed grubs, which speedily hide in the ground to pupate. Mosquitoes, it will be remembered, carry disease from man to man; *Glossina*, on the other hand, may derive its disease-causing organisms from big game, which act as reservoirs without apparently suffering any ill effects. It is not till a month or so after its sanguinary meal that the fly becomes infective; during this time the causative parasites of sleeping-sickness are undergoing changes within the insect's body. Then, for at least four months, man or beast bitten by the fly will surely become infected by the organisms causing sleeping-sickness. Some comfort may be derived from the fact that these

flies live only in definite situations, or 'fly belts'; and, by destroying the brushwood which the flies frequent, or by moving the natives *en bloc* from the 'belts,' considerable progress has been made towards reducing the ravages of sleeping-sickness.

Compared with the last-named disease, plague may be considered a disease of the Middle Ages. Not that it has been stamped out, by any means—there have been some recent serious outbreaks—but its greatest ravages, when it became a perfect scourge, occurred in the years of long ago. It and its method of transmission, however, are so well understood that it is one of the diseases which may be said to be in a fair way to being eradicated. Originally a disease of rats and some other rodents, plague is carried to man by the agency of a flea.

The cup is by no means full yet; the list of insect misdemeanours can be extended to far greater lengths. The common house-fly, which most of us in our youth were taught to protect, is now known to be a very important agent in the transmission of tuberculosis, though it accomplishes its fell designs in a different manner from the flea, the tse-tse fly—as *Glossina* is called—and the mosquito; for it has no biting or piercing mouth, so it cannot penetrate the human skin. It is no less dangerous on this account; its filthy habits render it obnoxious. Consider what happens when an insect, with a body well adapted for the carriage of germs, feasts and frivols on the dung-heap, the outside privy, or the garbage-tin, and a moment later, in an attempt to quench its thirst, drowns itself in the contents of the milk-jug, or becomes hopelessly involved in the family jam.

In some parts of the tropics and sub-tropics a hideously disfiguring disease, known as elephantiasis, is rife; it is so called on account of the enormous swelling which it produces in the limbs and other organs of its victims, so that a human leg may grow to resemble that of an elephant. The actual disease is caused by minute, transparent, thread-like worms, not more than one-hundredth of an inch in length, which dwell in the human blood and lymph. And here is a very pretty, though true, story of these parasites. By day blood drawn from a pricked arm or finger or leg of a man suffering from elephantiasis would probably reveal no trace of these tiny worms; towards evening the same test would show a multitude of the parasites, a proof that they lurk in the deep-seated vessels in the day-time, and travel to the vessels just below the skin at nights. There is a reason for almost everything in nature, though sometimes her ways are obscure. Any one who has lived in a mosquito-infested country knows, only too well, that the attacks of these insects are always more virulent after sundown; during the day they bite but little or not at all. The blood-parasites, then, by coming to that part of the human body

where they have the best chance of being sucked up by a mosquito, at a time when this is most likely to happen, are giving themselves every opportunity of being carried to a new host. Again, it is necessary for them to be taken up by the mosquito, for only in its muscles can they complete their life-cycle.

Many ticks are proved disease-carriers, a dozen different flies are under suspicion, the bed-bug is all but convicted, and lice also have a record equally bad. Practically every insect capable of piercing the mammalian skin must be under suspicion till such time as it is acquitted of disease-carrying propensities. It is not pleasant reading, when there is so much that is beautiful in the insect world; but facts are not always pleasant.

But even could some undreamed-of power destroy all the disease-bearing insects in a night, the situation would still be serious. The monetary loss occasioned by these little pests is almost beyond belief. Take the codling moth, the little scoundrel whose unwelcome grub is so often discovered at home in the core of an apple. He has been known to destroy 90 per cent. of an apple-crop, not only in one year and at one place, but over and over again. Seeing that he is common wherever apples are grown, his escapades are no small drain on the pockets of the apple-growers. The Mediterranean fruit-fly, probably the most destructive fruit-pest in the world, is of such importance—or shall we say so notorious?—that special quarantine officers are appointed at all the North American ports to prevent his effecting a landing. The grape-vine *Phylloxera* destroyed in less than twenty years one-third of France's fairest vineyards; then it was discovered that the attacks of the pest could be circumvented by grafting the French vines on to American stock, which had become immune from the insects' attacks. The Colorado potato-beetle put half the potato-growers in the world into a state of panic till a remedy for it was discovered. The Hessian fly frequently causes a loss of 50 per cent. of the wheat-crop in countries where this cereal is extensively grown. These form a select band of six-legged criminals, to which may be added a couple from the almost countless host of destructive insects, mainly because they are surrounded by the glamour of romance. The gipsy moth is sufficiently destructive in Europe to be classed as a pest; it is partial to woodland trees. It has, however, never become so absolutely out of hand in its native home as it has in the land of its adoption, America, where it was accidentally introduced just fifty years ago. It is the old tale of the rabbits in Australia over again, with this difference—they were purposely introduced, but the introduction of the gipsy moth was an accident. Half-a-century ago an American entomologist was seeking a substitute for silk; he collected silk-spinning moths from all over the world, and among them he imported

the gipsy moth from Europe. He was careless of his charges, and some escaped, with the result that over a million dollars a year is now being paid by the American Government in a vain attempt to keep the little aliens in check. Every likely remedy and a good many unlikely remedies have been tried. Predaceous beetles, which had kept the insect within bounds in its European home, were introduced; everything, in fact, that the cleverest entomologists in the world could think of has been attempted, with the result that the insect is still spreading, and ruining valuable forests as it goes.

Half-a-century ago also another insect, in the shape of the cottony cushion scale, was introduced into America from Australia. It destroyed about half the citrus-groves in California within ten years. The Americans attacked the problem with their usual perspicuity, and sent an entomologist to Australia to study the native habits of the insect. His researches proved the happiest in the whole realm of economic entomology. A little ladybird beetle was sent all the way from Australia to America to see if it would lend its aid in the destruction of the cottony cushion scale. So successful were its efforts—it devoured the scale whenever and wherever it could be found—that at the present time there are great breeding establishments in America where the ladybirds are reared in millions, and when an outbreak of the citrus-pest occurs the beetles are despatched to deal with the situation. As a consequence, the cottony cushion scale is

no longer a serious pest to citrus-growers, and it has been brought within reasonable limits solely by the little Australian ladybird.

On the credit side there is little to add. Few insects give us anything of real value. The silkworm; the honey-bee; the lac insect, which provides shellac; the cochineal insect, which fell into disrepute with the introduction of aniline dyes; and one or two others of minor importance, are almost the only insects which are a benefit to mankind. Little enough in very truth to balance against the awful indictment which could be brought against insects in general. In the Boer War disease carried off more men than did bullets, and much of this disease was caused by insects. The true history of the present war has yet to be written, but preventive medicine has progressed rapidly in recent years; hence much better conditions prevail. The appointment of competent entomologists on every front is a move in the right direction.

Every summer the question of infant mortality is raised; as often the house-fly is harried in a half-hearted manner. It must be brought home to the public that the house-fly is the cause of the majority of these deaths which we can so ill afford. When that is done, 'the man in the street' and 'the woman at home' will unite in a war of extirpation.

Are we to leave the insect in eventual command in this world of ours, or, with the advent of happier times, will he be dealt with as he deserves?

## THE FORESTER'S GIRL.

By Mrs W. F. IRVINE BELL, Author of *John Pardon's Choice*, *Ole Cam'ron*, &c.

### CHAPTER XX.

WHILE only a short mile distant, in one of the wildest spots of that wild district, the forester grappled in a life-and-death struggle with his supposed rival, his cabin by the roadside stood so silent and serene in the early morning sunshine that a gray timber-wolf, gliding stealthily out of the bush, where a famished goat had provided him with breakfast, squatted on his haunches in the open, and lazily scratched his ear. Then, with the unerring instinct of his kind, detecting something uncommon about the door ajar and the palpable silence within, he fearlessly stole into the kitchen, padded softly about from corner to cupboard, and snatching in sharp, white fangs an untouched ham from the shelf, leisurely trotted away to hide his booty against a leaner day.

None was there, however, to note the thief or the theft. Within the fast-cooling stove a handful of red embers were rapidly graying into the unsubstantial ghosts of what once had been ruddy boughs pencilling blue skies; a coffee-pot, whose fragrant contents had ceased to steam,

stood beside an unused cup; and on the well-scrubbed table bread and bacon still awaited the knife. But this morning no small, soft hands busied themselves with preparations for breakfast, no light footfall hurried to and fro on household tasks.

When David Hardy, after a wearisome tramp, reached home, sore and smarting from his recent experience—at one moment cursing himself as a fool for allowing himself to be tricked into a quixotic promise to a man he detested; at the next, as a vision of Anita's pale face and shadowed eyes rose before him, secretly relieved that he was in honour bound not to frighten her by telling of his quarrel with Gavin Barrie—it was to find the cage empty and the bird flown. Plastered as he was with foul mud that caked clothes and hair, and somewhat unstrung now by the violence of his emotions and of his struggle with Gavin, he felt it almost as a reprieve not to have at once to face Anita; and, too absorbed in his own physical plight to notice details, once satisfied that she was not in the

house, he closed and locked the door, and stripped off his loathly garments.

Then, having washed himself, and with many a muttered curse freed his hair from the dried mud, he opened the drawer in which Anita kept his fresh clothes neatly folded, and with the comfortable sensation of cleanliness once more pervading his being, coupled with a ravenous appetite, began to think of food, and at the same time automatically of his wife. He had felt no special surprise at her absence, knowing that often when he was away very early she herself would slip out into the sunshine, and return a little later with a basket of cones or bark, the quicker to heat the oven. But now, looking about more carefully than hitherto, he was surprised, then angered, to find she had gone out breakfastless, and left the coffee he had so thoughtfully prepared for her standing untasted. Hastily searching the bedroom, he found the clothes in disorder, his note and her hat gone, although her high boots were left scattered about as though she had suddenly begrudged the time to lace them.

This somewhat reassured David, and he began rekindling the stove, the while his overwrought mind swayed between anger against Anita, increasing uneasiness at her prolonged absence, and a pettish feeling of grievance on his own part, very rare to him, that she should have left him to prepare his own meal on his return from Goose Lake.

Through the rapid stream of his thoughts flowed, too, a sullen undercurrent, which now and again bubbled to the surface in such disjointed phrases as: '— him! I'll get even with him yet!' 'Thinks he'll make off, and that'll be the end of it, does he?' 'Durned foreigner! What business, anyway, have he and his cursed dawg to hang around our lakes?'

Then, as his wife's incriminating reticence about Barrie's visit again obtruded itself, he quivered with jealous pain, and cursed the day that had brought the Englishman to Grizzly Station. But, as the time passed and Anita still failed to return, his angry mood changed to one of anxiety; and, re-entering the bedroom as the last place where he had seen her, his eye now discovered a note pinned to the white slip. With unsteady fingers the forester opened the folded paper, whose few lines, blurred by tears to which a sodden handkerchief bore witness, seemed to dance before his astonished eyes.

They ran thus: 'I am going away, David. Please believe me that I tried to tell you last night that the camper on Goose Lake had been here, and who he was. But you didn't hear me, and then—then I was terrified lest you should be angry again and misunderstand. You have been a far better husband than I deserve, but I am not the bad wife you will now think I am; and we can never be happy like this. Try to forget and forgive—Your loving, heart-broken ANNIE.'

Rooted to the spot, Hardy read and re-read the pencilled words, so misleading to a mind already dangerously deflected into a channel of malignant thought. 'Going away! Going away!' he repeated in dazed fashion. 'Going away—where? What for?' Then suddenly, as his eyes travelled more steadily up and down the paper, it was with the forester as when a thunderbolt blasts and rends one of the strong sinewed giants of the forest whose appointed guardian he was; for at one instant sheet-lightning seemed to illumine every corner of his mind, and the next, to leave it seared and blinded. 'God in heaven!' broke in tones of agony from his lips. 'My girl has gone to that foreign chap! Blind fool that I was to be so tricked! Oh Annie, Annie!' and in a paroxysm of anguish he dropped into a chair, burying his face in his hands. But the turmoil of his thoughts soon drove him to his feet again, and, with his wife's last message crushed in his hard fingers, he tramped the floor, muttering to himself and calling down imprecations on Gavin Barrie's head.

At length, flinging far from him the crumpled paper, he exclaimed, in such loud, bitter tones that, borne through the open windows, they must have startled the peaceful spirits of the great silences, 'Let her go! Let her go to her smooth-spoken paramour! Never man loved woman more faithfully than I have, and,' with a great sob in his voice, 'God knows I tried to make her happy. But'—here the fierce blood again rushed to his head—'true as there is a God above, I'll kill that skulking coyote, if I have to track him to the ends of the world, or lose my own life on the trail!'

Goaded by the thought, he began feverishly examining his revolver and cartridge-belt, and in another moment—so wild was his mood—would have rushed out on his mad quest had not the sudden bur-r of the telephone and his chief's voice speaking providentially deterred him.

'That you, Dave? Better ride over to Rattlesnake. Fire broken out there again. If there are any campers still about, you must keep a sharp look-out on them. Everything is as dry as powder!'

'A precious sharp look-out!' muttered David.

'What's that?' queried his chief. 'Oh, all right; thought you said something. Well, get a move on. There'll be some wind later on. So long!'

'So long, chief!' mechanically replied the forester. He stood a moment irresolute, then snatching up his hatchet and usual equipment, raced across to the corral, bridle in hand, and was soon loping up the well-known road. As thus on duty bound he hurried along, he could not forbear (albeit reason assured him the last direction his lost Annie would pursue was the rough road winding northward through desolate, and yet more desolate, country, until it dipped

down, sharp and precipitous, to the green ribbon of Ruby Springs) glancing from side to side, and whenever an extra rocky acclivity compelled even so sure-footed a steed as his to slacken its pace, the man's eyes and ears were on the alert for slightest sight or sound in the thickets. But in that wide republic of the wild nothing stirred, nor fur, nor feather; and the tense stillness so wrought upon the rider's strained nerves that when at length, round a bend of the road, there echoed the rattle and clink of iron-shod wheels and hoofs, his hand flew to his revolver, and his face wore so intent and distraught a look that the driver of the piled-up wagon which now hove in sight bawled out in blended tones of good-natured raillery and sarcasm, 'Hello there, comrade! You out for a "hold up" job? Got a mug on ye 'u'd scare the devil! Can't ye say, "How d'ye?" to an old pal before ye shoot him?' And David, recovering himself, recognised the grinning countenance of Nat Duncan.

'Hello yourself, Natty! No; I was lookin' out for a coyote that's been thievin' round my shack; but I reckon them rattlin' old wheels o' yourn scared him away! Bringin' out folks' stuff from Ruby, be you?' he questioned, drawing rein, and pulling his horse aside to let the other pass. 'No, don't you stop,' he went on, as Nat, stopping his sweating horses, took out his tobacco and began settling for a talk. 'I've got orders from the chief to use my nag's best legs to get over to Rattlesnake. Hell of a lot o' fires there'll be by-and-by!' he called back over his shoulder, spurring his horse forward.

'Lord, man! 'pears you're in some hurry, seein' the day's young yet,' laughed Nat; then, raising his voice above the din of rattling tires, he shouted, 'And how's the pretty little girl?—Missis Hardy, I *should* say, beggin' her parding and yourn. Do ye keep her locked up good

and safe, as I telled ye to!' he roared, winking waggishly.

David, inwardly anathematising the state of the road that made it impossible to set his buckskin to a gallop, and stung to the quick by Duncan's ill-timed jesting, yet had but one impulse—to protect the name and fame of his 'girl,' traitress to his love though he now believed her to be. 'Oh,' he replied, forcing himself to respond to his friend's banter, 'she's right smart, thank you, Nat; but you don't want to cage your bird too close once you've caught her. If they want to fly away agen—why—the words unbidden flared from his lips—'why—let 'em fly!' Instantly checking himself, however, he went on lightly: '*Mine's* the early bird too! Guess you'll see her down to Mrs King's. She was off down there early, I reckon, while I was huntin' up the horses. Believe she's gone to see about some housekeepin' stuff.' Then, moved by some unaccountable impulse, instantly, but too late, regretted, he called out, as the distance between himself and the noisy vehicle increased, 'If you see her, give her my love, and tell her to hustle back home.' So saying, he dug his spurs so sharply into the sides of his patient beast that it sprang forward with a snort, and rapidly bore its rider out of sight.

For a long moment Nat Duncan, his hands still hollowed round a newly lighted cigarette, stared with stiffening neck over his shoulder to where a puff of reddish dust alone bore evidence of the vanished horseman. Then, removing the 'fag' from his coarse lips and spitting wide over the wheel, he said beneath his breath and with huge relish, 'Damn me if I don't think that youngster's canary-bird's got claws!' With a short, appreciative laugh and a sharp snap of his whip, he, too, vanished among dust-wreaths in the opposite direction.

(Continued on page 371.)

## GEOLOGY AND THE WAR.

By 'SILEX.'

**A**MONGST the useful sciences that have been 'discovered' under stress of warfare, probably none has come into greater prominence than the science of geology, of which there is still, nevertheless, a woeful amount of misconception.

By sheer necessity we have been compelled to develop to the uttermost our home resources of mineral wealth, with the result that geological maps and memoirs, both official and private, are now studied in this country to an unprecedented extent. We must frankly acknowledge our debt to those far-sighted pioneers who persuaded a somewhat grudging and sceptical Government to institute and finance (albeit meagrely) a geo-

logical survey of the country in the early part of last century, and backed it up by their own brilliant and independent investigations, and gave it moral support.

It thus happens that records that were patiently accumulated for nearly one hundred years in comparative silence—one might almost say furtively—are now being eagerly consulted by all sorts and conditions of men, a large majority of whom, unfortunately, have not the necessary simple geological knowledge to make the best use of the maps and information put into their hands.

Our islands have been richly endowed with minerals, which were worked, in many cases,

for centuries before geology ranked as a science; with the result that the minerals were often wrongly named, old workings were unrecorded, and the mining was done by rule-of-thumb methods that had disastrous results upon the unworked ground.

Even at the present time cases can be shown in which mining is unscientific, in the sense that the persons controlling operations are ignorant of the structure and lie of the rocks with which they have to deal.

Although this country is the original home of the science, geology and geologists have been slow in making headway, and in breaking through the crust of prejudice and ignorance or indifference with which they were surrounded. Ours is at heart a conservative people with ingrained ideas.

By way of contrast, the geologist in a young country, like the United States or any of the great Dominions, is not looked upon as a dry-as-dust bore or a 'fossil,' poring over some musty book or still mustier bone, and weaving baseless theories, but is considered rightly as a 'live' man, to whom is entrusted highly responsible work in testing the fitness of the country for human habitation and successful endeavour.

In such countries the topographical surveyor, the railway engineer, and the pioneer are accompanied by competent geologists, who examine and name the rocks and minerals met with on the spot, and record their positions, lie, and extent upon the maps made by the surveyor. This practice does away with all possibility of error at the outset.

In recent years a great discovery of gold in the Rockies was reported by a prospector. The inevitable result would have been a mad rush to the spoil had not the responsible Government promptly had the occurrence investigated by a staff geologist, whose report stopped the boom and staved off disaster for many people.

In this country the science has had to catch up with, and get ahead of, settled occupation of the land and the improper exploitation of minerals. Geologists have raised their voices in vain protest against the obvious waste of money in certain mining operations, and in search for water or special minerals in rocks known to be barren, and against the misnaming of rocks and

mineral specimens or the classification of rocks of different geological types under a single trade name.

Above all, they have protested against the sin of leaving unrecorded valuable evidence upon the structure of the land obtained in mining, boring, and quarrying operations. This policy is worse than that of the dog in the manger, for its ill effects are liable to recoil in the long-run upon its authors.

In recent years, however, things have been looking up, and the geologist is coming into his own. No longer is he looked at askance as a dreamer and no practical man. Manufacturers, mining engineers, miners, well-sinkers, estate agents, and others are beginning to see that there is something in it after all, and to understand that there may be as many brands of geologist as there are specialists in Harley Street.

Geologists, like doctors, are grounded in the principles of their profession, but most have a special bent, that may lead one to have a better knowledge of the ways of oil or water than of the microscope, or of mineral ores than of the fossil contents of the strata.

Since the war began they have given advice about water-supply for troops at the several fronts, about the nature of the terrain in the occupation of the enemy, and the character of the rocks in which his trenches and dug-outs are constructed. More recently they have examined his concrete to find out the source of the gravel used in its composition. Nearer home, they have been called upon to advise in locating minerals for munitions of war and to find new sources of supply, as well as substitutes for previously imported raw materials. They are required to estimate reserves, and to consider in what direction future developments of coal and other mineral fields may best be undertaken. And many other things they do, about which, however, it is better to maintain a strict silence.

The time is now propitious for geologists and mining-men to work in concert and to pull together for the good of the country. A strong stimulus would be given to this happy union were only the first principles of geology taught to advanced pupils in our schools; for a knowledge of the earth we live on is of the beginnings of wisdom.

## A LITTLE SHIP.

By 'TAFFRAIL,' Author of *Pincher Martin, O.D.*; *The Sub*; *Carry On!* &c.

CHAPTER II.—continued.

### III.

WHEN we commissioned the *Triptolemus* we were beset by very few pitfalls. For one thing, our ship's company consisted of less than a hundred all told; while the ship, being brand-

new, was as clean and as smart as a new pin. The men, of course, were strangers to the officers and to each other, but both the first-lieutenant and myself had just come from another destroyer

—of which the *Triptolemus* was a newer edition—in which we had served together for over two years. So two of us, at any rate, knew each other's ideas and habits, understood what to keep a watchful eye upon, and how to repress the comic proclivities of the inevitable funny man during working-hours. I have known the greater portion of a ship's company kept in a state of idle and hilarious excitement the whole of one forenoon by the antics of one of their number with a piece of burnt cork. Our men could not afford to be idle. They had their work cut out to embark mountains of stores and ammunition, and to stow them on board in their various storerooms, magazines, and shellrooms.

Before the ship was finally handed over to us she had to carry out her trials, and one sunny morning in June found us steaming down the river on our way towards the open sea. I don't know how many people there were on board. I omitted to count them, and merely remember having a vague recollection at the back of my mind that sixteen average men weighed approximately one ton. We carried several tons of extra, but not superfluous, flesh, bone, blood, and muscle. The ship was crammed to bursting with the firm's officials and workmen, Admiralty representatives and overseers, not to mention the officers and men who would presently form the ship's company. We were merely there as spectators to take over in the remote possibility of our meeting a German submarine. A pilot was in charge, while the contractor's men ran the engines and fired the boilers.

'Supposing she breaks down on trial?' I injudiciously asked one of the firm's representatives.

'My good sir,' he replied, with a look of injured horror, 'have you not learnt that our ships never break down?'

I apologised meekly, for he was perfectly right. A destroyer built by that particular firm appears every six weeks with the utmost regularity, and in no case has one of their vessels failed to exceed her contract speed. Nothing ever goes wrong, and the cut-and-dried programme is carried out to the very day, hour, and minute.

'At a quarter to seven to-morrow morning a motor will be waiting outside the door of your hotel,' Mr Matthew had told me at lunch the day before. 'After picking you up, it will call for our friends here,' indicating the chief and the Admiralty hull overseer.

'I shall be there,' I said.

'You had better be,' said Mr Matthew dryly. 'The ship waits for nobody, mind; not even the Prime Minister of Great Britain or the Bishop of Bath and Wells!'

'Are we to be honoured with their august presence?' I queried.

Mr Matthew glowered at my frivolity. 'No!' he snapped, wagging that finger of his.

'But the ship sails at 7.30 by my watch, *D.V.* or not. If you aren't on board by that time, she goes without you; and that's all about it!'

'And shall we have the pleasure of your company?'

'The answer is in the negative.'

'Coward!' I retorted with a sweet smile, whereat Mr Bunderson laughed, and the apostolic one became rather annoyed. He always resented one's taking liberties with him.

And by 7.20 precisely we, the naval people, were all on board; while a few minutes later Mr Matthew, watch in hand, appeared on the jetty abreast the ship. At 7.30, to the tick, he shut his chronometer with a snap, thrust it into his waistcoat pocket, and waved his hand to the pilot. The men on the jetty started to haul the gangway ashore, when suddenly I heard excited voices under the bridge.

'Has any one seen Mr Elkington?' somebody was asking loudly. 'We can't leave without him!'

Who Mr Elkington was I hadn't a ghost of a notion. I had never even heard about him; though, from the commotion caused by his absence, he was evidently a person of importance who had something to do with our trials.

'Mr Elkington is missing!' they told Mr Matthew.

'Damn Mr Elkington!' retorted Mr Matthew, grinding his teeth.

And just at that moment the cause of all the commotion shot round a corner as if the devil were after him. He—Mr Elkington, not the devil—clutched a bag and an umbrella in one hand, and a bowler hat in the other. He came on gallantly, his overcoat flapping in the breeze behind him. He was in a desperate hurry.

Mr Matthew, with a face like a thunder-cloud, produced his watch and eyed him ferociously.

'I hope I'm not late,' the new-comer apologised, arriving breathless on the jetty and scrambling on board. 'The train'—

'Damn the train!' snorted the manager. 'You're two minutes fifteen seconds late, and I won't listen to your excuses. If Admiralty officials aren't punctual, how can you expect the contractors to deliver ships up to time, eh?'

But Mr Elkington, bag and all, was far out of earshot. The trial was quite satisfactory, and the *Triptolemus* exceeded her contract speed by at least two knots. Moreover, the firm did not intend their representatives or ourselves to go hungry. On the contrary, they evidently realised the invigorating quality of the Scottish sea-air, for the wardroom table was specially lengthened, and their catering staff had staggered on board with enormous hampers of provisions and cases of bottled beer. And we did not go hungry, either. The Food Controller . . . but the Food Controller was not there, so what does it matter?

And three days later, after an official inspec-

tion, we left the shipyard for good and all; while Mr Matthew, a number of lesser celebrities, and a crowd of workmen assembled on the jetty to see the last of their handiwork. We steamed down the river, carried out the final 'acceptance trial,' and then anchored in the estuary and forthrightly in the wardroom to sign the necessary papers transferring the ship to the Admiralty.

'Well, here's luck to the *Triptolemus*,' said the firm's senior representative, finishing his whisky-and-soda, screwing the cap on his fountain-pen, and reaching for his hat. 'I think you'll find her a good ship, and I hope you'll bag a submarine within a week. Don't go blowing yourself up on a mine, though!'

'Not if I can help it,' I laughed. 'Here's fortune to the firm!'

We followed them on deck, and a few minutes later the last of the contractor's men were scrambling into the tug alongside.

'Come along! Hurry up, men!' a bowler-hatted potentate on the paddle-box exhorted them, watch in hand. 'We shall miss the train if we aren't careful!'

The little vessel sheered off with a tootle of her whistle, a grinding of her paddles, and a waving of hats and handkerchiefs.

'*Au revoir!*' we called out after her.

'Good-bye! Good luck!' floated back. 'Hope you'll have a good passage!'

Ten minutes later, with her paddles stirring up the water behind her, and a volume of black smoke pouring from her thin funnel, she was fading away in the distance. She was in a

hurry. The people on board her had their train to catch. She somehow reminded me of a hungry, anxious chicken darting home at feeding-time.

And before very long our capstan was heaving round and the cable was coming slowly home.

'Anchor's away, sir!' came the shout from the forecastle. 'Clear anchor, sir!' as the muddy hook came to the surface.

The engine-room reply-gongs clanged noisily. The ship, gathering speed, turned on her heel, and an hour later we were in the open, the coast was fading into a bluey-gray line astern, and we were steaming at twenty knots in the teeth of a short, snappy little sea and a rapidly freshening breeze. We had left the fleshpots and amenities of civilisation behind us; but I, for one, was glad to be away.

'Now she feels it,' laughed the first-lieutenant as the ship started to bob and curtsy, and dollops of spray came driving across the forecastle. 'This'll shake the insides out of some of our people who've never been in destroyers before.'

It did, for on looking over the bridge-rail I saw a mournful, white-faced little party—well, offering their first tributes to Neptune. Poor fellows! they had my sincere sympathy. They were fearfully and wonderfully indisposed.

Yet another destroyer had been added to His Majesty's Navy. Yet another few ordinary seamen (for hostilities only) were learning from bitter experience that life on a T.B.D. is not all beer and baggy trousers.

## THE SACRED LAKE IN ASHANTI.

By DAVID BOYLE.

SOME thirty-five miles south-east of Coomassie, after interminable travel through the vast steamy silences of the Ashanti forest, one is conscious of the path going steadily but surely uphill, and suddenly one finds one's self on the forest-covered rim of an enormous basin some four miles across and slightly less in length. In this basin lies a great clear lake reflecting the play of the clouds, a mirror untarnished save for the stakes of fishing-nets. Still the silence, the loneliness, of Africa; but a sort of mocking quiet. No boats—they are forbidden, as it is a fetish lake—no sign of life, apparently. But when one looks more closely, there are villages in plenty around the edge right below the hills, little collections of the ordinary Ashanti houses that seem to cover away from the cold mirror into the warmer green heights above. It is all right below, some four hundred feet or so of steep slippery hillside, and to look down at it gives almost the impression of a view through the wrong end of a telescope. A careful inspection reveals the fact that what might at first be

thought log-stumps are in reality men paddling on logs, all that they are allowed to do, and it is thus that they go out right to the centre for fish, for which there is an elaborate system of nets. This is the sacred Lake Bosumtwé, its fish and its customs jealously guarded by 'fetish' that prescribes exactly how the fish with which it swarms may be caught. Founded on the natural instinct of the Ashantis for 'animism' in all its forms, this fetish acts as a well-devised conservancy board, and by its regulations makes certain a constant supply of fish for all time. For example, no lines may be used, no boats may be put on the lake, and no mesh smaller than a certain size may be used in the nets, thus guaranteeing that the smaller fry may have a chance to grow big, that only a reasonable amount of fish are caught, and that every one has the same chance of a catch, good or bad.

There is a very powerful fetish priest in charge of the lake, and it says volumes for the tact and skill of our administrators that friction

is seldom heard of, and that a nice balance between native custom and modern progress has been kept right up to the present time. The water is brackish, and the natives, of course, hold that it connects underground with the sea; and its depth has never been established, as all attempts to fathom it up to now have failed. The people in the fishing-villages round the lake seem to have a lower level of reasoning and humanity than their agricultural relatives in the farms that everywhere lie hidden in the Ashanti forests, and the whole atmosphere gives one an impression of mystery, of primitive conditions. Viewed on a rainy day, this great gray gulf below the hills seems to be almost a veritable jumping-off place from the world; no roar of sea or breakers, as one might expect, but a wind tearing past into an unfathomable pit of colour-

less silence. Weird and fearful, no wonder that the people called it 'fetish'—it is so unutterably alone. They say they will not cross the lake even during the day, and, curiously enough, rest from fishing every seventh day for dread of a big snake, some declare, that lives in the middle. This is, however, probably in origin another wise rule of the 'fetish' priesthood to lessen the taking of fish!

As evening comes on, a few birds awake from sad contemplation and call from hill to hill, till suddenly the last gleams of light leave the water, and later the green sides and the whole crater become a misty tomb in an unearthly silence. Even the chatter of servants in the camp behind dies out at once amid such surroundings, and the silent forest reigns again now as it did before man intruded into this Avernus of West Africa.

## A NARROW SHAVE.

### A STORY OF ADEN.

By C. G. NURSE.

THE gun at the signal-station on Shum-shum, the highest point in Aden, had just announced the arrival within signalling distance of the P. and O. steamer carrying the mails from India.

'Mail-boat *a gaya* [has arrived],' remarked the havildar of the Residency guard, as he placed his rifle in the arms-rack.

He had just returned after relieving the sentries, and, taking the *hukka* (pipe) which was handed to him by one of the sepoy, settled down to a quiet smoke.

Outside the Residency the native sentry paced up and down in the fierce heat of a May afternoon, halting from time to time in the shade of the porch, and wishing that his turn of duty was over instead of just beginning. In the harbour below most of the shipping was concealed from sight by an intervening promontory, but now and again the shouts of Arabs and Somalis, engaged in coaling a steamer, could be distinctly heard.

Inside the Residency Brigadier-General Stockton, C.B., General Officer Commanding and Political Resident, Aden, to give him his full title, sat under the punka awaiting the arrival of his mail. The heat indoors, though somewhat mitigated by the regular fanning of the punka, was still considerable, and the perspiration streamed down the general's neck as he leaned back in his chair and lit a cigar. In spite of the heat, the general's thoughts were not unpleasant. He had attained the rank of brigadier-general at an unusually early age, and his present duties were congenial to him, and might afford opportunity for further advancement. The position of the General Officer Commanding at

Aden is somewhat peculiar, as it includes both civil and military authority; in fact, it is in many ways similar to that of governor of one of the minor colonies, though the holder has not the status of governor. He is frequently addressed as 'Excellency' by foreign naval officers and diplomats to whom he affords hospitality on their way to or from the East, and is always known as *Al Wāli* ('the governor') by the native chiefs and dusky 'Sultans' of the Aden hinterland. A wide knowledge of men and matters, as well as considerable tact and discretion, is necessary for the successful discharge of duties in such a position, and all these the general possessed in a marked degree. His work and training had been, up to a few months before, when he was appointed to his present post, purely military, but he had at Aden an adequate staff for the performance of the civil duties. Being a wise man, he was content to hold the reins of authority without interfering unduly in the details of the civil work, and was, in consequence, popular with his subordinates.

The Resident's reflections were interrupted by the entry of an Indian servant bearing a large bundle of letters.

'General sahib *ka dāk*' ('The general's post'), he said respectfully, as he placed them on the table, and then withdrew.

The Resident began to open his mail, and to sort out the correspondence into three heaps, the first and largest for matters civil and political, the second for military communications; in the third and much smaller heap he placed his private letters. By the time he had nearly finished sorting his letters the

first assistant, Lieutenant-Colonel Staples, was announced.

Colonel Staples was a 'military-political,' who from his subaltern days had devoted himself to civil and political work. He had held his present post for some years, was a successful administrator, and had a thorough grasp of local conditions. In all matters pertaining to his department he was the Resident's right hand.

'Morning, Staples,' said the Resident. 'There is a big mail for you to-day. There are one or two things I want to ask you about. I see they have sanctioned an increase to the police force here of one sergeant and six European constables. This is the first I have heard of it.'

'The matter has been going on for nearly a year,' said Colonel Staples. 'The late Resident asked me to draw up proposals, and I did so, recommending twelve European policemen. However, even six and a sergeant are better than nothing, and will do for a beginning.'

'Well, up to now you seem to have managed very well with natives,' said the Resident; 'and I am afraid you will not get British policemen to stay long in a climate like Aden.'

'I have no doubt we shall find the men, sir,' said Colonel Staples, 'and they will be very useful in dealing with sailors, who are often a great deal of trouble, as they simply ignore the native police. A European is worth a dozen natives in dealing with a drunken sailor.'

'All right,' said the Resident; 'go ahead with it. I shall be interested to hear how the matter progresses.'

After a few minutes' conversation on other local official matters, Colonel Staples took his departure, and made his way to his own office.

During the next few weeks Colonel Staples secured, on loan for a year, the services of a smart young police-sergeant from Bombay, and four time-expired soldiers of good character from among those serving at Aden. He decided to reserve the other two vacancies for ex-sailors, if suitable candidates could be found, and informed the newly appointed police-sergeant of his intention.

On arrival at his office one morning, he found, waiting to see him, a man dressed like a boatswain or a quartermaster, who introduced himself as a candidate for one of the police vacancies. The man, who gave his name as James Spurrell, was of fine physique, appeared to be about thirty years of age, and spoke like a man of some education. On being asked for his papers, he said, 'I am afraid, sir, I have no papers to produce. I was serving on the s.s. *John Bathurst* as quartermaster, but met with an accident on board, and was sent ashore to hospital. All my papers and most of my kit remained on board ship. I only came out of hospital yesterday, and was going to ask for a

passage to England, when I heard there was a vacancy in the police here, and thought I would apply for it.'

Colonel Staples liked the look of the man, and his story seemed in every way plausible; so, after making a few further inquiries regarding his services at sea and other qualifications, he said, 'Well, I suppose you know what the pay is? If the doctor passes you, I will take you on probation in the police, but you will have to write for your papers, and let me see them when they arrive.'

'Thank you, sir,' said Spurrell. 'I will write home for my papers by the next mail.'

James Spurrell was duly passed by the doctor, and entered on his duties during the next few days. He soon got through the very limited amount of drill required of a policeman, and showed both zeal and intelligence in the performance of his duties. He was popular with his comrades, and, being a man of some education, made himself useful to his superiors in various ways.

Meanwhile Colonel Staples had proceeded on leave pending retirement, as his health was beginning to suffer from long residence in the East. He apparently forgot all about Spurrell's papers, as he did not mention the matter to his successor, Major Ingram. The major was much struck with Spurrell's evident capacity, and when the police-sergeant returned to Bombay on the expiration of the year for which his services had been lent, Spurrell was promoted to the vacant post.
